EXTRACT

From an Act prescribing Rules for the Goverment of the State Library, passed March 8th, 1861.

SECTION 11. The Librarian shall cause to be kept a register of all books issued and returned; and all books taken by the members of the Legislature, or its officers, shall be returned at the close of the session. If any person injure or fail to return any book taken from the Library, he shall forfeit and pay to the Librarian, for the benefit of the Library, three times the value thereof; and before the Controller shall issue his warraut in favor of any member or officer of the Legislature, or of this State, for his per diem, allowance or salary, he shall be satisfied that such member or officer has returned all books taken out of the Library by him, and has settled all accouuts for injuring such books or otherwise.

SEC. 15. Books may be taken from the Library by the members of the Legislature and its officers during the session of the same, and at any time by the Governor and the officers of the Executive Department of this State, who are required to keep their offices at the seat of goverment, the Justices of the Supreme Court, the Attorney-General and the Trustees of the Library

MINING AND SCIENTIFIC PRESS.

An Illustrated Journal of Mining, Popular Science and General News.

BY DEWEY & CO., Patent Solicitors.

SAN FRANCISCO, SATURDAY, JULY 3, 1875.

VOLUME XXXI Number 1.

The Union Iron Works.

This institution is the oldest established and the most extensive fonndry and machine shop on the Pacific coast, and in its appointments will bear a favorable comparison with any of the iron works in older cities East. The engraving shown on this pago represents the front of the works, which, however, face on Mission and Fremont streets as well as First, covering an area of 275 feet by 186 feet. Additions have been made to the buildings from time to time, as the necessities of business demanded, and several changes have recently heen made as stated hereinafter. No better indication of the ndvance in progrsss of the Pacific coast could be given, than that shown hy the steady increase in bnsiness of a representative mechanical iustitntion of this kind; and nbrief history of its origin and growth will repay perusal hy those interested in mechsnical pursuits or the progress of California.

The Union Iron Works were originally fonnded in 1849 by Messrs. James and Peter Donshue, and at that time consisted of a small rude furnace and a few commou tools, not even covered in or protected from the weather. The furnsce hlast was produced hy two hlacksmith hellows. Soon after the works started the first iron casting turned out on the Pacifio coast was made, in the shape of a "steady or spring bearing," for the propellor *McKim*. Thie casting cost fifty cents per pound. From thie little "plant" the Donahue Brothers built up a very large business, enlarging and improving their estahlishment from time to time, and endeavoring to keep it in advance of similar works which in course of time sprung up around them. Iu 1856 James Donahue sold his interest in the business to his hrother Peter, who erected a large hrick building on the site of the roofless workshop of 1849, and carried on the business in his own name.

As Mr. Donahue, however, was engaged in other enterprises of great magnitude, he was unable to exercise a personal supervision over the mechanical branch of his husinsss, and in 1863 formed a copartnership with H. J. Booth, of the Marysville Foundry, and C. S. Higgins, under the firm name of Donahue, Booth & Co. Mr. Booth had been in the foundry business in California for twelve years, and Mr. Higgins was also an active business man; hut the institation did not flourish as it should, and the firm sold out in 1865 to a new firm composed of H. J. Booth, G. W. Prescott and Irving M. Scott, under the firm name of H. J. Booth & Co.

Under this firm the foundry has heen running for the past ten years. As soon as they took hold of the business it began to increase wonderfully and new machinery was purchased, more men employed, and the facilities incressed gradually to the present timo, until now it is the most completely eqnippsd foundry and machine shop on the coast.

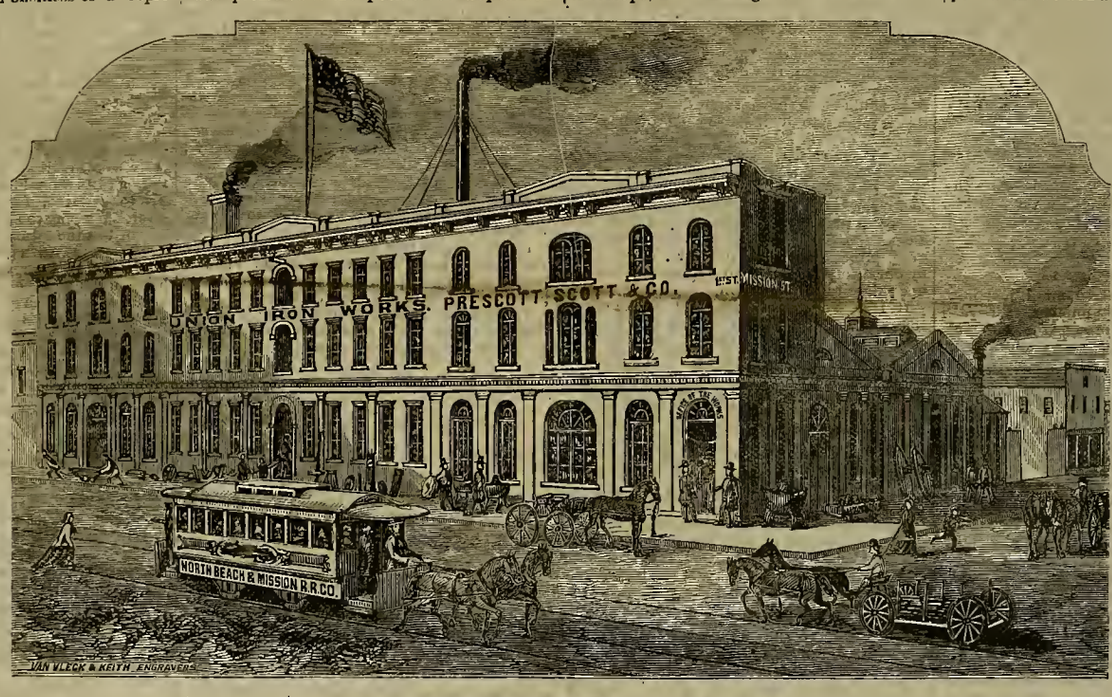
The New Firm.

On the 8th of laet month Mr. H. J. Booth retired from the businese and the firm name was changed to Prescott, Scott & Co., the new firm comprising G. W. Prescott and Irving M. Scott of the old firm, and H. T. Scott, who has for about eightyears been connected with the firm as confidentisl agent. G. W. Prescott and H. T. Scott will as hefore conduct the commercial and financial dspartments, and Irving M. Scott continues to superintend the mechanical branches of the bnsiness.

Mr. Prescott, the senior member of the firm, was one of the originsl members of the firm of H. J. Booth & Co. He is one of the best finsncial men in San Francisco, aud a first-class, intelligent mechanic. He has traveled nearly all over the world, gaining a great fnnd of iuformation thereby. He is on: of our prominent citizens, and is a capitalist who always has his money within reach. Mr. Prescott is head of the financial department of the works and is a mau who is respected by all who know him.

Irviug M. Scott, well known as one of California's most intelligent mechanics, came to the works as draftsman in 1860. In 1861 he was promoted to the position of Superintendent of the works, of which he has had charge ever since. He and Mr. Prescott both came in as partners in 1865. Mr. Scott has distinguished himself hy improviug greatly the mechanical details of all varieties of quartz machinery. When he first began to make a point of this, stsmps were able to crush from one half a ton of quartz dry to one and a quarter tons wet, per day. Now they crush two tons dry and up as high as five tons wet, a result which Mr. Scott has addod much to gain. He took out with Mr. Eckert in 1867, a patent for a slide valve governor, au invention of great importance and rightly judged to he a very beautiful and simple contrivance for controlling the speed of the engine under all conditions whether loaded or suddenly relieved from the entire work, or gradnally unloaded. The principle consisted in connecting the ingress of steam directly with the governor, making it supreme, shutting off or letting on steam, as circumstances might require. Mr. Scott hae no doubt contributed more to the mechanics of metallurgy than any other man on the coast. He has improved the mechanical details of nearly all the pans and settlers, making suggestions of value to the inveutors, while the machines were under his supervision. He introduced the first double armed came, with hub on one side, for quartz mills, which are now in univereal uee. It must he remembered that iu making machinery of this kind much had to be left to the machinist a few years ago when all the principles were not eo well laid down as at present. It was therefore of the greatest moment to the numorous inventors who were experimenting with this class of machinery, to have an intelligent mechanic who was thoroughly inte-ested in the improvement to suggest such features iu detail as would cheapen or strengthen the machine aud at the same time effectually carry out the inventor's ideas. Mr. Scott's claims as a first class mechanic are fully recognized hy all his competitors in business—a conceded compliment not easily gained. Although he did not on entering the firm hring with him much capital, he brought what was better, energy, mechanical talent and an excellent executive capacity.

H. T. Scott, the new member of the firm, a younger brother of the Supsrintendent, has been connected with the iostitution for some eight years. He first went into the casting department, then the time department, then collection, and was finally confidential agent of the old firm. During Mr. Prescott's absence in Europe, he is manager of the financial and commercial department, in which he has shown much ability. Hs hss had charge of the purchase of supplies for the works for the past four years. He has made his way ahead in the institution unaided hy relatives, but depending on his own energy and ahility for advancement. He is a young man of much promise.



UNION IRON WORKS—PRESCOTT, SCOTT & CO.

The Buildings

Comprising the works are not of elegant exterior, although the interior arrangements are well adapted for the purposes for which they are used. The offices have been recently fitted up in neat style, with counting room, business room, private offices, etc. A new and commodious boiler shop has recently been erected, as mentioned hereinafter. The inetitution is connected with the American District telegraph system of this city, and has speaking tubes, etc., throughout the buildings.

Each mechanical branch of the businees of these works comprises a distinct department under the special charge of a foreman of experience. The workmeu rely on merit alone for promotion, and discipline is maintained with a firm hand, the rules heing thoroughly understood.

The Drafting Department

Room ie completely fitted np, being supplied with the very best materials. Details of ordere are here worked ont for delivery to whichever department is to fill the order. There are eight draftsmen employed, in charge of Eugeue O'Neil, who has worked his way up from the machine shops to the head of this department.

The Pattern Shop

Is amply provided with planers, lathes, band saws, circnlar saws and a complete ontfit of machinery of this class. Every facility is here given to turn out work in a superior style at short notice, the machinery all being well adapted for the purpose and the men skilled in their trade. This shop is in charge of Willism McConuell, who has hesn in the institntion for many years, and worked his way up to the head of his department. There are eighteen men employed in this shop.

The Foundry

Is of course au extensive branch of the establishment and gives employment to 127 molders. It is well supplied with proper appurtenances. There is one crane of thirty and one of twenty tons capscity; two large sized coro ovens, three cupol is, with a capacity of melting 64,000 pounds in two and a half hours; pits and appurtenances for making the largest cylinders in castings of any description. One of the core ovens is one of the most approved appliances invented up to date, enabling them to do this class of work very cheap. This department is very complete. It is under the charge of Heury Dimmick, a superior mechanic, who hss been in the fonndry since 1863, and worked his way from a common molder in the shop up to his present position.

The Machine Shop

In these works contains some of the largest tools on this coast. The appliances in this department have heen enlarged to meet the reqnirements of the increase of work on heavy machinery for the Comstock mines. Every kind of mschinery that can aid man's labor is represented here, and all of the most approved patterns. In this department there are thirty-four lathes, from twelve to twenty feet, and thirteen planers from six feet wide by twenty-four feet long to ten feet wide hy thirty feet long, both lathes and planers heing the largest on the Pacific coast; six slotters; fourteen drills from ten feet to ninety-six feet; two vertical horing mills from four to eight feet; four horizontal horing mills, three bolt cutters, two nut tappers, two nut fscers, six shspers, four pulley lathes, two spur gear cutters from two sud a half inches to twenty-six feet; two hevil gear cutters from six inches to ten feet; also a complete assortment of milling machinery, small tools, cranes capable of handling thirty tons, cars, car tracks, etc., etc. This department is superintended by Wm. Worth, an old hand at the foundry, and one of the most thorough mechanics in California.

The Blacksmith Shop

Has seventesn fires, two steam hammers, and is supplied with cranes, small tools, and all facilities for turning out forgings of all kinds. About forty men are employed, over whom Patrick Hayes is foremau.

The Boiler Shop

Is a new building, erected this year in the rear of the main buildings and fronting on Fremont street. It ie supplied with a complete outfit of new and improved tools. Pipes, boilers, tanks and uumerous other thinge are constructed in this department, which in reality includes many various details which are inseparable from the business. By a new system of

(Continued on Page 8.)

CORRESPONDENCE.

London's Loss, San Francisco's Gain.

EDITORS PRESS:—The recent incorporation of the Tybo Consolidated miuing company, in San Francisco, marks a new era in the history of mining operations in this section of Nevada. It will stimulate prospecting and encourage the opening up of other properties that have been partly neglected of late, as well as foster the local industrial pursuits of the place. Henceforth we will not be dependent upon the capricious conduct of British capitalists or anffar from the red tape formulas of English official life. London's loss will soon become San Francisco's gain, thongh for the sake of the interests of the State, it would have been well were this property vended in the former city, for it would add to the importance of Nevada. However, the vastness of our mineral resources is becoming every day more evident, and since there are very many valuable properties lying around, the man of means has not got to travel far in search of an investment, for such chances are to he met with in almost every district of the State. Here foreign capitalists have had presented to them opportunities the like of which were not to be found elsewhere, and if success has not accrued to them from the operations of the past, it is safe to say that to their own indiscretion and their own inexperience can be traced the disastrons consequences which have resulted from their specnlations. In nine casee out of ten, these have been the prevailing causes of the severe losses which have heen snstained by English operators on the Pacific coast. Theu the blame oame to be laid ou the country, its mines and its people, instead of bsing charged to the want of judgment exercised by themselves in the matter of selecting their agents. Here is where the chief mistakes have heen made, and to this want of caution on the part of English iuvestors, can he readily traced many, if not all, of the failures that have taken place. Ordinary prudence has been entirely overlooked, and ignorant and irresponsible charlatans, calling themselves geologists and mineralogists have been entrusted with ths almost exclusive disposition of their funds, and have thereby inflicted much injury npon all concerned.

Of the many ventnres inaugnrated by

English Capitalsis

In Nevada, we caunot call to mind, just now, more thnn two out of the number, that are at present bearing out the promises of, and sustaining the reputations of their vendors in the British metropolis. Even one of these did not until quite recently, become a very desirable or profitable purchase. Under the administration of its English managers, it was driven to neerly tbe verge of bankruptcy, and how the company escaped having to resort to the nsual refuge of English mining companies, the winding up court, is nnaccountable to those who knew and understood the character of the men placed at its head. But it is presumable that the magnitude of the price paid for tbe property and the immense sums that had been recklesely squandered in unprofitable work and useless experimentslizing, together with their great faith in the value and permauence of their mines, were the inspiring reasons that prompted the further and the further disbursements of their golden dncats. But it is a fact worthy of note, that uutil the company determined to entrust the management to an American, and did do it, no certain nor encourag ing returns had ever been received from the vast sums expended. Since then success has followed snccess eo fast, that now its English owners can at least console themselves with the sweet satisfactiou derived from the conscions nees of owning a valnable property, free from incnmbrances of every kind, estnblished upon a paying basis with bright prospects and a radient futnre before it.

Frank Drake and his partner, Applegarth, the latter of whom resides in London, were the vendors of tbis property. It is at present quoted nt £6¾ on the London stock board, it is not uulikely that it will soon be in a position to disburse quarterly, perhaps monthly dividends, there having been cleaned up recently $100,000, the result of a twenty-five days run on Eberhardt and Aurora ore. Four thoneand dollars per day is not to be sneered at, especially when there appears to be lots of the same quality of ore from which to choose. What eays that metaphorical old gentleman of ruhicund countenance and vast avoirdnpois, to the above evidences of the barrenness of Nevada? Do they not eloquently appeal to his reason nnd his pocket alike, stagger his skepticism and put to instantaneous flight all of his firmest resolntions in favor of the exclusive employment of members of his own household to manage his mineral possessions in this country? They ought at all events to hnve some little influence in removing his prejudices, injurious alike to the interest of his own realm as well as to the reputation of this commonwealth.

The other of these mines is the

Richmond,

Of Eureka. This is now looked npon, and justly, as one of ths most valuable propsrties in Eastern Nevada, and has contribntsd more than any othsrs owned by Englishmen, towards removing the odinm whioh has attachsd to almost all American mining securities, since the bursting of ths Emma bubble. It was placed on the London market in 1872, by J. M. English of San Francisco, Presideut of the Gila and West Side companies, of Reveille, and of the Tybo Consolidated, of Tyho.

To this gentlemen is also dus the credit of having launched in the English capital, the Sweetland Creek mines, than which there are few more remunerative in the Golden State. To his enterprise is also largely due the creation of the foregoing three named compenies, thongh we must not forget that he has been ably seconded in his efforts to promote the lsnguishing interests of Reveille, and to stimulate and revive the drooping indnstries of Tyho, and Nye county generally, by his indefatigable associate, John B. McGee, of the latter district and county. Their faith and enterprise have heen nnbounded, and shonld meet with the rewards they so riohly merit. The Gila and West Side and Tybo mines will soon begin to bear golden fruit, and be claesed among the dividend paying institntions of Nevada. The valne of the

Tybo Consolidated

Can be best nnderstood, when we advisedly state that its owners have, up to the period of its incorporation, dishnrsed on account of purchase and construction accounts, and for the development of the property, to bring it to its present prosperous condition, no less a sum than $400,000 in clean coin. There has never been, to our knowledge, placed on the merkets of either San Francisco or London, anything in the mining line to equal it in the mere matter of longitudinal, lnteral and vertical exploration, or in the completeness of its exterior equipments, such as steam hoisting works, ore bins, tramways, furnace, mill, (twenty stamp), all necessary out-offices and hnildings, refining and calcining departments, water tanks, coal bins, together with nesrly three miles of solidly and securely laid water pipe, through which flows a copious supply, fed through branching pipes to all parts of the works.

Had this property been placed on the London stock board, it would have very greatly subserved the mining interests of our State, for we should then hnve three dividend paying mines to help to dieaipate the bad feeling that seems to exist in England regarding the mines of the Pacifio coast. But siuce it has not been floated there, the loss in that respect will be more than counterbalanced by the gain that will revert to our own people from having it placed in their midst. Thue they will all have a chance to become sharers in its fortnnes, for every property like it owned here, and worked by our own people, has an nppreciable bearing upon their futnre condition.

It is a well noted fact, that an American company is far more energetic as well as more enterprieing in every respect, and for that reason imparts a greater degree of stimulus to local intereats of whatever character, thau does an English incorporation. The reasons then are obvions, why the former is more desirable than the latter. The English people have been guilty of many blnnders, but the greatest error which they could have committed, was when they allowed the withdrawal of the Tybo property, to have it incorporated in the Bay City. Verily the ways and fancies of the Britishers are past finding ont. Here waa au excellent chance given them to partly re-imbnree themselves for the losses of the past, and they were coutent to let it pass because of their prejndices. We well remember that they did about the same thing in the early days of Eureka. Then, of course, they had some show of reason, the couutry being little more than a *terra incognila* to the greater portion of the mining world. At that time they incontinently rejected the property offered them hy Messrs. Buel & Bateman, at ahout half its value. That property is to-day embraced withiu the lines of the

Eureka Consolidated,

Of Eureka in this State. The property was at that time examined by English experts, and if we remember rightly, for we were then on the ground, their report was so nnfavorable that their principals declined becoming its purchasers. They have freqnsntly since them had cause to repent them of the hastinese o their decision. They will one of these days, too, have just as good cause to regret the conclusions arrived at in relation to the withdrawal of the Tybo Consolidated. The Eureka is to-day one of the leading mines of Nevada, and it and the Richmond are no doubt without a parallel in the mineral world. After more than four years of nninterrupted production, they yet stand pre-eminent as hnllion producers, and the same wealth of ore permeates the nndergronnd workings of both, so that it is a question which of them contains the greatest bonanza. The reports that have lately reached ns of the dimensions of the Enreka bonanza, henr about them an air of exaggeration, but yet we are inclined to thiuk them entirely correct. Friend Cassidy, of the *Sentinel*, gives the length ae developed up to 28th ult., at 280 feet, width or thickness 100 feet, depth 160 feet. These dimensions, allowing ten feet in place for a ton of ore, would give an amount approximating 290,000 tons of ore in sight in that bonanza. Wonderful, indeed! Over $33,000,000, according to the estimated valne of the ore. The estimate mede by a correspondent of the *Enterprise*, nppears to be the more correct one of the two, though by saying so we do not wish to impugn the verscity of the *Sentinel* in the least, yet the differsnce in ths two statements ars somewhat antsgonietic, and can hardly be very well reconcilsd; however, siuce we do not wish to enter the lists as the champion of either side, we will withdraw and lsave the solntion to others.

Ths Richmond is as big a mine as the Eureka Consolidated, bnt siuce it came entirely under the control of English officers, it is not the well managed property it was while an American superintendent was at its head. Then energetic action and vigorous development were ths rules and not the exceptions. Now ths siokly conventionalities of rontine that distingnish the English from the American management, hold triumphant sway. No property can be rendered remnnerative by such a course of action. It is, however, the custom of eome men to do exactly as their fathers did, and worship the ideas, appliances and methods of an antedsluvian age, chiefly because such and such things were done, and still are being doue in Cornwall, or elsewhere within Albion's Isle.

DE LA POEA.

Nevada, June 13th.

Plumas County Mines.

EDITOAS PRESS:—Having occasion to run around a little, I visited some of the mining camps in thia locality and write you a few lines concerning them.

Heath & Dodds are starting their new ditch, which they expect to complete within a year and which will be nine miles in length. Their mines are situated five miles east of Buck's ranch and are very extensive surface or placer mines.

At Hungarian Hill, owned by Gurny & Co., there are also extensive hydraulic claims which are now paying well. The largest run of two pipes, ninety hours, paid $1,400.

Thomas, Jolly & Co., near Nelson's Point, ten miles southeast of Quincy, have strnck it very rich in a large hill, too high to hnve water the year round, but it is a light deposit and deep, and pays big. Those are principally new operations.

Many other gravel mines are being improved in this county, but on a smaller scale. Some on Middle Feather and some on the east branch of the North Fork. Among the latter are Mnmpherd's Hill, near Meadow valley; Heath & Co., East Branch; Scott's Bar, and Stagg Point, Middle Feather. There is a great deal of good ground unprospected in this county, but capital ia necessary to the development thereof.

I have besn in this locality for many years and know of many places that wonld yield a large profit on capital judiciously expended, hut out of reach of the common laborer.

The town of Quincy is improving rapidly. Water is scarce in the monntains. This ie bad for placer but good for river mining.

HAY PAESS.

Bucks' ranch, Plumas county, June 23, 1875.

Bald Mountain Mining District.

EDITOAS PRESS:—In my rnmblings through the northeastern part of the State, I spent two days in the nbove camp, and I must say was very much surprised to find two or three mines of so much promise undeveloped and lying idle. The Crown Point ledge is as fine a prospect for a large and valuable mine as I have seen in the State, according to the amonnt of development. This mine is situated immediately on the summit of the Ruby range of monntains, running parallel with the mountain, and stands perpendicular, shows a trne fissure, the west wall being a fina clay seam of one to two inches in thickness. This miue has a tunnel or shaft over forty feet, all in ore. I am told that about half the ore from thia mine will pay $60 to $75 per ton, the remninder $25 to $35. This vein is at least five feet in width.

The Sutro mine is south and close by the Crown Point. It is owned by the same parties that own the Crown Point. I am told that Dr. J. M. Bailey holds the controlling interest in all the prominent mines in the camp. The Satro is about five feet in width and contains some very rich ore, mostly chloride. An incline shaft forty-six feet deep has been run on this ledge. Some fifteen or twenty tons of rich ore are on the dump. A few tons of this ore has been shipped to the Newark mill thirty-five miles, and some to Reno mill for reduction, yielding $128 to the ton.

I only visitsd one out of the four copper ledges in the camp; the one I visited shows a very large snrface or oropping of fine ore, assaying twenty to forty per ceut. in copper. I am surprised that some mining speculators have not had the property in haud long before this tbis time, as I understand the owner, Dr. Bailey, offers inducements rarely to be had when the prospects are so flattering. I would not be surprised to see the one of the leading camps of this part of the State in a few years. The camp is favorably situated, with plenty of fine timber aud water, sixty miles from Elko, and forty miloe from the narrow gauge railroad from Palisade to Enreka. It is in White Pine couuty, fifty miles due north of Hamilton.

J. W. GIBS.

Bald Mountain, Nev., June 14th.

Monterey County Mines.

The Monterey County *Democrat* says: In the southeast portion of this county lie the districts known as Peach Tree, Slack's canon and Cholame. Hsretofore the supposition has heen that the tracts of country so styled possessed little value save for grazing purposes. The facts are very diffevent. In the first place, hoth districts comprise considerable bodies of plow land of very good qnality. As to climatio advantages, they are healthy, and, as the experience of this season shows, hy no msans liable to mischief from drouth. Being supposed, commonly, to be of a very dry oonstitution, in this dronthy year hay and grass in the Peach Tree district are of exceptionally good quality and the Cholame stock growers consider themselves in as good position as any of their fellows in the oonnty.

The population is considerable in numbers already, as shown by the fact that they have three election preoincts and three school honees. New comers are constantly swelling the local census list.

Quicksilver, Coal and Iron,

Bnt what we now chiefly direct attention to, are the stores of valuable minerals contained in these districts, which promise in the immsdiate futnre to employ much capital and many men to work them.

As to the leading mineral, in value, we mention that H. F. Pitts and others are working a lead of qnicksilver located at the head of Cholame valley, which ia oonaidered rich, and from which 100 tons of ore have been got out, a hsap being in sight. Arrangements are in progress for the constrnotion of furnaces and retorts and it is expeoted that shipments of metal will soon be oommenced. In the vicinity of this mine on the same lead of ore, about thirty other claims have been located, which are being prospected, promising good results. To the northwerd, in Slack's oanon, F. M. Stone is at work on another quicksilver mine, which, like the rest, offers a fine prospect.

Coal.

About eight miles southeast of Slack's cauon, distant eighteen miles from the Salinas r er (the line of the S. P. R. R.), F. M. Stone & Co. are now opening a coal mine and are taking measures to ohtain capital with which to work it. The mine was discovered in April, 1870. And the coal, which is of course bituminous, has all along heen considered to offer every inducemeut to its working, save only in the matter of transportation. The prospect of an early continuation of the Southern Pacifio railroad has stimulated the discovers and owners to exertion, for, now, while opening the mine, they may look to the Southern Pacifio railroad as the means of conveying its products to consumers, with good prospect of the early realization of their hopes. Four shafts have been sunk upon the lead, which has been traced about one mile and a hnlf, hnving n dip of about 45°, and as sunk upon growing less. West of this mine, three-fourths of a mile, Snyder is sinking a shaft npon the same supposed lead and has the "sign."

Iron.

One and one-half miles west of the ooal discoveries, in a slide on the break of a mountain, bonlders of iron ore, weighing as much as 300 pounds each, are found, in numbers indicating the proximity of an extensive lead. There show, also, on the eastern side of the same monntain, indications of gold and silver mixed with the iron ore.

The Importance

Of these discoveries is great; as the value of the minerals, if their qnautity be sufficient, would offer the strongest inducements to the railroed company to extend its line and he the occasion of the rapid development of a region that people have been in the habit of considering a desert.

The Great Mines.

The *Alta California* recapitnlates the mines which have paid large sums to their owners without being assessed at all. The capital stock of the Imperial was $50,000, which constitnted its whole capital. It prodnced $3,562,791, and paid $1,067,500 in dividends.

The Consolidated Virginia mine has a nominal capital of $10,800,000, hnt only $411,200 was ever paid np, while $10,000,000 bullion has been produced. The California mine to-day has a nominal capital of $54,000,000, hnt it has never levied a dollar of assessment, and never will, although it has been explored and ore laid hare which has been estimated in value from $400,000,000 to $800,000,000. The Belcher mine has a nominal capital of $10,400,000, but the owners never paid np but $600,600. That sum snfficed to turn out $25,938,854 of bullion, and to give the shareholders $14,248,000 more than they paid out. In the same way Crown Point, with a nominal capital of $10,000,000, cost $623,370 only in assessments, and has paid $10,000,000 in dividends. The Eureka gold mine has paid $2,094,000, and never cost a dollar.

It is said that the inventor of the new motive power, by which water is converted into steam without fire, has sold the exclnsive right for New York city to Commodore Vanderbilt, for $95,000, but n Philadelphia firm having bought one-half the right for the United States, have prayed for au injunction to prevent the sale, oonsidering the sum paid much less than its true value.

MECHANICAL PROGRESS.

Resistance of Woods to Torsional Strain.

Professor R. H. Thurston, of the Stevens Institute of Technology, Hoboken, N. J., has been making some experiments to see how different woods will bear a twist, and gives the following as his results:

The test pieces were seven-eighths of an inch in thickness, at the middle or smallest part, and were made from the following woods: White pine, S., yellow pine (sap wood), S. yellow pine heart wood), black spruce, ash, black walnut, red cedar, spanish mahogany, white oak, hickory, locust and chestnut. The conclusions drawn are as follows:

White pine yields quite rapidly as the torsional moment increases. The maximum strength of the test piece was 15 1-2 foot pounds, and it was twisted completely off at a total angle of torsion of 130 deg. The substance is thus shown to have little resilience. Yellow pine has much greater strength, stiffness and resilience. The sap wood is equally stiff with the heart wood, but sooner passes its limit of elasticity. Spruce is less stiff than white pine, even, but possesses greater strength and resilience, its moment of resistance reaching 18 foot pounds, and twisting through a total angle of torsion of 200 deg. Ash seems to be weaker and less tough than is generally supposed. Its most striking peculiarity is its very rapid lose of strength after passing its limit of elasticity. Black walnut is very stiff, strong and resilient, and is but little inferior to oak. Its resisting moment reaches 35 foot pounds and one specimen attained a total angle of torsion of 220 deg. Red cedar is stiff but brittle, and loses all power of resistance after twisting through an angle of 92 deg. A torsional moment of 20 foot pounds only produced a total angle of torsion of 50 deg. Spanish mahogany is very stiff and strong. It is deficient in toughness and resilience, losing its power of resistance very rapidly after passing the limit of elasticity. White oak has less torsional strength than either good mahogany, locust or hickory, but is remarkable for its wonderful toughness. It passes its limit of elasticity at 15 deg., but loses its resisting power very slowly. The latter remains unimpaired to a torsion of 70 deg., and yields completely at 253 deg. Millwrights are evidently correct in holding this wood in high esteem for strength, toughness, and power of resisting heavy shocks and strains. Hickory has apparently the highest ultimate torsional strength combined with unusual stiffness and considerable resilience. Its moment of resistance to torsion reaches a maximum of 58 foot pounds. Locust has greater stiffness than any other wood on the list, and stands next to hickory in strength; it is also very resilient.

A NEW USE FOR CAST IRON.—Messrs. West & Patterson have recently introduced in Pittsburg a new and neat article under the name of Rank's Grave Guards. Though a grave subject it is nevertheless an indispensable one. These guards are designed for the purpose of preserving the symmetry of burial mounds. They are made of metal, cast in moulds of various patterns, with a square socket on each end for holding the head and foot stones securely in position. The casting is open in the middle, allowing the mound to project through so that flowers may be planted and kept in their proper place by the sides of the guard. The whole casting is painted white, or ornamented, and may be made to represent mottled or white marble. They are durable from the fact that cold weather will not break them, nor will they rust when well painted, and are very much cheaper than marble or stone, being sold at about one-third the cost of marble. They may be seen at No. 132 Smithfield street.

STEEL FOR BELLS.—The greatly reduced price of steel is gradually introducing that metal into very general use. It has of late been largely used for belle. One of its advantages for such purposes has been alluded to in a late German paper as follows: The three cast-steel bells which fell at the burning of the church of the German Reformed community at St. Petersburg have again been hung, and are found to be none the worse for several hours' endurance of a furnace-like heat. One of these bells, which was cast at the Bochuner vereins factory, has historic antecedents. It was presented to the St. Patersburg community after the invasion of Denmark by tha King of Prussia; and now that it has been again hung, it is proposed to change its name from King William, which it formerly bore, to the Emperor William.

BAND SAWS VS. CIRCULAR SAWS.—The German industrial papers are discussing the question of the disadvantages of circular sawe as compared with band saws: 1st. Circular saws are very dangerone to the workmen. 2d. They require a much greater power to drive them than any other kind. 3d. They make a much wider cut, producing more waste, and thus fewer products from a given amount of material. The only advantage is that the cost of procuring a circular saw is less than that of a band saw; but notwithstanding, the Mechanics' Association (*Gewerbverein*) of Muehlhausen have already published in their yearly report the advice to abolish their use wherever it is practically possible to do so; and this is of course the case in the great majority of circumstances.

The Bessemer Channel Steamer,

The much talked of experiment of Mr. Bessemer—a swinging saloon for avoiding sea sickness in crossing the English channel—seems to have proven a failure. At all events Mr. Bessemer has found it necessary to abandon the idea of making the cabin maintain its level automatically, and now entrusts that duty to a man who stands in the center of the cabin watching a spirit level, and managing with a single lever a complicated and powerful system of hydraulic brakes. Any one who knows by experience how difficult it is to hold a spirit lever perfectly motionless, will understand the delicacy of the task which this Bessemer brakeman has to accomplish. The incessant motion of the restless waves has to be counteracted by an equally incessant movement of the lever. A moment's inattention or carelessness, and the swinging cabin swings madly through an arc of many degrees. We do not understand, however, that he has entirely given up his project; that he is still hopeful of making it a success is quite probable and natural. But there can be no doubt but that he is sorely disappointed at the result thus far.

Perhaps it may be truthfully said that the swinging saloon has not yet been tested under conditions favorable to the formation of an intelligent and unprejudiced opinion of the practicability of the idea, and the fact that it was allowed to remain fixed during the public trial trip, although all the machinery for maintaining its equilibrium was in position, may be regarded as indicating that Mr. Bessemer and Mr. Reed, his architect and contractor, have no great faith in its successful working. The English papers express doubts that it will ever be regularly employed in the channel service, owing to its unmanageableness in entering and leaving the Calais harbor. This, however, remains to be determined. We certainly hope that Mr. Bessemer will succeed in making his ship a success, and that to the disappointment which he doubtless already feels will not be added the mortification of complete and final failure.

The *Engineer* expresses an opinion that the swinging saloon, even if it is made to work, will never prevent sea sickness; yet it is always best to avoid an over confident opinion with regard to an experiment which does not absolutely imply in its success a positive nullification of well known natural laws. The declaration of Lardner that it was folly to think of crossing the Atlantic with a steamboat; the jeering of Davy at the idea of lighting the streets of London with gas, and the incredibility of other savants with regard to the assumed possibilities of railroad traveling in the early days of the locomotive, will always stand out as so many warnings against the propriety of condemning the future of anything which admits of a scientific possibility.

PERPETUAL MOTION UNDER GOVERNMENT PATRONAGE.—It appears from a statement in the *Manufacturer and Builder* that the notorious H. M. Paine, well known throughout the country for his many attempts to utilize foolish and impracticable schemes, is now at work in New York under Government patronage, in the construction of a "perpetual motion machine!" He proposes the absurdity that a column of water, say 300 feet high, and hence with a pressure of 150 pounds per square inch, is capable, by the employment of certain mechanism, of moving an engine without any expenditure of water whatever—by simple pressure alone! Hence, every man with a water pipe in his house, of ordinary pressure, may apply that pressure to an extent proportioned to the pressure and size of pipe, to any desired mechanical purposes. If so, why will not a pile of brick, or stone, or sand, answer the same purpose—why insist upon water alone? We leave our readers to ponder over such an absurdity, and place their estimate upon the engineering capacity of the Government officer who could lend himself to such a swindle. The statement seems almost incredible; yet we find it, in detail, occupying nearly a page in the journal mentioned, with the principle of the mechanism fully illustrated and described. We should add, however, that the *Manufacturer* ridicules the idea as absurd in the extreme.

BESSEMER STEEL IN SWEDEN.—According to late accounts there are now thirteen Bessemer steel works in operation in Sweden. In most of the works great attention is being paid to the production of extremely soft steel, for the manufacture of armor plates for ships. The greatest difficulty encountered in the works is in keeping up a uniform character of steel, for the reason that, for the sake of economy in production, the Bessemer steel converters are fed direct from the blast furnace. A good and uniform steel has not yet been produced direct from the ore; although it is a most important step in the progress of iron manufacture to turn out even a very inferior steel by that clean and rapid process. The possibilities of the future in this direction are highly encouraging.

STEEL DIRECT FROM THE ORE.—At a recent meeting of the Iron and Steel Institute, of England, one of the speakers, with the obvious endorsement of the other members present, among whom were some of the most eminent metallurgists, spoke confidently of the prospect there appeared of steel being manufactured as easily and cheaply from the ore as iron is now. An interesting fact in this connection will be found in this department, under the head of "Bessemer Steel in Sweden."

SCIENTIFIC PROGRESS.

The New Discoveries in Regard to Light.—The Impact (?) of a Luminous Ray.

We alluded some weeks since to an interesting discovery by Mr. Crookes, in relation to what appears to be a hitherto unknown property of light, by which it possesses direct mechanical power, as if by impact, in rotating a wheel constructed similarly to a steamboat, but hung horizontally, its axis resting upon a pivot. This discovery is considered the most important since the day when the possibility of spectrum analysis was first made known.

The first discoveries by Mr. Crookes were made known to the Royal Society in August, 1873; but his more recent discoveries, which are still more remarkable, were first described there in April last. Mr. John Evans, F. R. S., President of the Geological Society, occupied the chair, and among the listeners present were the two Secretaries, Professor G. G. Stokes, and Professor Huxley; also, Dr. Wm. Huggins, Mr. O. W. Siemens, Mr. J. Norman Lockyer, Dr. W. B. Carpenter, Professor Maskelyne, and Dr. J. H. Gladstone.

Mr. Crookes began by stating that, in the paper which he had previously read to the society, he had made known how a lever arm of pith, delicately suspended in a very perfect vacuum, was repelled by the impact of light or radiant heat. A great condition of success in the experiments was to work with the highest possible rarefication; consequently the lever arms were suspended in glass bulbs from which the air had been exhausted by means of the Sprengel pump, which gives a far more perfect vacuum than can be obtained by the use of any other apparatus.

Until these experiments were made it was supposed that light had no action upon a lever arm of small ponderosity suspended in vacuo. Indeed, the circumstance that light could not turn a lever arm so suspended has been quoted in standard scientific text-books, by Dr. Balfour Stewart and others, as one point in the long chain of evidence against Newton's emission theory of light. But Mr. Crookes last week exhibited a bar of pith suspended by a cocoon fiber in a large glass bulb very well exhausted. When a lighted candle was placed about two inches from this bulb the pith bar began to swing two and fro, the swing gradually increasing in amplitude until the dead center was passed over, when several complete revolutions were made. The torsion of the suspended fiber then offered resistance to the revolutions, after which the bar began to turn in the opposite direction, and so on alternately. These movements were kept up with energy and regularity so long as the candle continued to burn. When instead of a candle a piece of ice was placed near the bulb, one end of the lever arm came towards it as if attracted; but the truth was, as explained by Mr. Crookes, that radiant heat was acting upon the pith bar from all parts of the room, and that the presentation of the piece of ice lowered the radiation on one side; consequently the movement was really caused by repulsion acting in the opposite direction.

The amount of repulsion produced could be measured. The advantage which a glass thread possesses over a cocoon fiber is that the index always goes back to zero. The fibres used to suspend the arms are so excessively fine that when the end of one of them is held in the hand the fiber usually curls upward like a cobweb until the other end of it floats almost vertically in the air.

As the vacuum becomes less perfect the repulsion grows less, until at last the neutral point is reached where there is no action at all. If still more air be then admitted, attraction instead of repulsion sets in. The barometric pressure of the neutral point varies with the density of the suspended substance on which the radiation falls; it varies also with the ratio of its mass to its surface, and with several other conditions. Thus the neutral point for a thin surface of pith being low, whilst that for a moderately thick piece of platinum is high, it follows that, with a rarefication intermediate between these two points, pith will be repelled while platinum will be attracted by the same power of radiation. Mr. Crookes proved this experimentally, by showing simultaneous attraction and repulsion by the same ray of light.

When these experiments were first made known, some of the observers tried to account for the effects by the assumed action of feeble air currents or of electricity, but both these hypotheses were considered by Mr. Crookes to be abundantly disproved. Professor Osborne Reynolds suggested that the movement might be due to evaporation and condensation at the surface of the suspended body. Mr. Crookes had a thick and strong bulb blown at the end of a piece of difficultly fusible green glass, specially made for boiler gauges. In it he supported a thin bar of aluminum at the end of a long platinum wire, the upper end of which wire was pressed through the top of the tube and well sealed for electrical purposes. The apparatus was sealed by fusion to the Sprengel pump, and the exhaustion was kept going on for two days, until an induction spark refused to pass across the vacuum. During this time the bulb and its contents were several times raised to a dull red heat. At the end of the two days' exhaustion the aluminum bar was found to behave in the same manner as, but in a stronger degree, than it would in a less perfectly exhausted apparatus, namely, it was repelled by heat of low intensity and attracted by cold.

Meteoric Dust.

Tissandier has conceived the luminous idea of looking for the meteoric dust in snow water; during a rain storm it is lost in the soil, but if snow be collected, the dust in suspension may be found after melting the snow. He publishes the following facts: If twenty-two gallons of snow water be evaporated to dryness, there remains a residue varying from 0.048 grammes, in the country equal to 0.212 grammes in Paris; this residue consists of a fine gray powder, the organic matter of which, being rich in carbon, burns brightly, and leaves nearly 60 per cent. of ashes, composed of silica, carbonate of lime, alumina, chlorids, sulphates and a large amount of iron. As a crucial test he melted a large body of snow found at a high altitude in Finland, remote from human habitation, and found minute particles of magnetic iron. As meteorites often contain magnetic iron, this is a verification of the theory that our earth is continually receiving accessions, if not of large meteorites, at least of meteoric dust.

Groveman brings this fact in connection with the aurora borealis, and proposes the hypothesis that the myriads of floating particles of magnetized iron, in entering our atmosphere, become incandescent, and arranging themselves under the influence of the terrestrial magnetism, group in magnetic lines in the same way as steel filings do under the influence of a magnet. The theory, however ingenious, does not sufficiently account for the disturbance of the compass needle during the aurora, nor for the duration of this phenomena for hours, as the burning of small particles of iron can give only instantaneous flashes.

We would ask the hypothesis that the floating iron particles make the region above our atmosphere a better conductor than the highly rarefied vacuum prevailing there (the absolute vacuum being found to be an absolute non-conductor); the electric currents from the charged upper regions over the poles, towards the damp conducting atmospheres over the equator, conducted by the metallic meteoric dust in the upper regions above our atmosphere, or *vice versa*, cause the luminous rays which we call the aurora borealis.

ACTION OF ELECTRICITY ON IRON.—The remarkable phenomena first observed by Prof. Gore, which consists in a very perceptible twisting of a bar of iron by the joint effects of currents of electricity passing longitudinally through, and also around such a bar by means of the insulated wire of an enveloping helix, has been further investigated. Subsequent experiments have shown that such twisting may be made to reach full one-quarter of a revolution. It has also been ascertained that both currents are necessary to the development of the phenomena. Either current, when applied separately, simply produces the ordinary effect of magnetizing the bar. The direction of the twist is definitely related to the direction of the current in the helix. In order to produce the fullest effect, the currents must be simultaneous. When they are successive a perceptible twist results in a lesser degree.

FAT DECOMPOSED BY SALT WATER.—M. Marticonana, a manufacturer in San Sebastian, long ago remarked that the fat which remained attached to salted skins was decomposed. Recently having bought fat which for a long time had been in contact with sea water, he had it washed with acidulated water, then with pure water, and finally pressed, when he obtained the fatty acids: stearic, margaric and oleic. This conforms to what at present is known concerning fats; rancidity of fats is nothing but decomposition, the glycerine separating from the fatty acids, and the fats from being neutral when fresh, become acid when old and rancid. It appears that the contact of salt water hastens this decomposition, while heat does this still more. Fat inclosed with water in a vessel and submitted to a heat of some 300° to 400° Fah. (of course under pressure), will, when kept in continuous circulation, be decomposed in eight hours.

SPECTRUM OF COGGIA'S COMET.—Spectroscopic observations on Coggia's comet, made at Greenwich observatory, show the spectrum of carbonic acid gas. When this gas was illuminated by the electric spark from an induction coil without a Leyden jar attached, the spectrum was nearly identical with that of the comet. Two bright bands were always coincident, but occasionally the coma of the comet gave a faint continuous spectrum in addition, while the spectrum of the nucleus was always continuous, and contained numerous bright bands, and three or four dark lines in the yellow and green.

METEOROLOGY.—Experiments were made in France last year to test how far the humidity of the atmosphere is affected by forests. One set of instruments for recording humidity was placed in the forest, and the other in the open air, a short distance off. The records showed that more rain fell each month in the forest than in the open air, and the total rainfall for six months was seven and one-half inches in the forest, and in the open field less than seven inches.

The Mining Stock Market.

We are unable to chronicle any new features in the mining stock market. Everything continues dull with small sales and low prices. Whether the unusual crop of assessments has anything to do with this continued depression, we do not know. The brokers probably live on hopes of the usual fall excitement coming on again, which would enliven their business a little. It is encouraging in view of the depression in stock circles, to observe the equanimity manifested on the Comstock, where everything is going on as usual, as if there were no stock market. Low prices does not seem to affect the progress of work, and at all the mines the usual activity prevails.

MEADOW LAKE.—Yesterday afternoon Messrs. R. M. Fryer and Jos. Perriu returned to Grass Valley from Meadow Lake mining district. They had been up there, in company with others, to examine the resources of that part of the country. Mr. Fryer has worked many samples of Meadow Lake ore, by his process, and has been very successful. The ore is very refractory, but he saves, every time, to within ninety per cent. of a fair assay of gold. In fact no assayer has yet been fouud who can find any precioua metal in the tailings left after the Fryer process. In a short time a quantity of ore will be sent down from Mesdow Lake, to be thoroughly tested by the new process This ore will come from various parts of the district, and the working of, say fifty tons, in that way, will show what Meadow Lake can do under the new order of things. Grass Valley's free ores, of course, can be worked up to a true assay value of the ore. Mr. Fryer goes to San Francisco this morning but will return in a few days, and then business will begiu.—*Grass Valley Union.*

THE new machinery ou the Utah mine, on the Comstock, is found to work with the utmost smoothness. The first lift of the pumps is already in place, and draining the shaft will be commenced in a very few days more. The new machinery, in point of power and finish, is second to none on the line of the Comstock, and the prospecting of the mine can now be reaumed and prosecuted with renewed energy and vigor.

AT the Dayton mine the heavy sole plates for the engines and other portions of the machinery are being placed on the stone foundations; and the erection of the whole is being crowded to completion with all the vigor possible.

ON the Ophir mine the new and powerful inline hoisting engines are being placed in position ready for future aervice. The heavy atone foundations for the pumping engine are fast approaching completion.

MINING SHAREHOLDERS' DIRECTORY.

Compiled every Thursday from Advertisemente in the Mining and Scientific Press and other S. F. Journale.]

MINING SUMMARY.

THE following is mostly condensed from journals pnblished in the interior, in prnximity to the mines mentioned

California.

ALPINE.

MINERS' MEETING.—Alpiue *Chronicle*, June 26: Au adjourned meeting of the miners of Silver Mountain District was held here on last Satnday evening. R. H. Ford in the Chair, and Recorder Leggett acting as secretary. Thomas W. Leggett was unanimously re-elected District Recorder. The district laws were amended so as to conform with the U. S. mining laws. The article regarding the amount of surface ground to be taken up was amended so as to read "not less than 50-ft nor more than 300 ft on each side of the ledge." The articles regulating the amount of work to be done on a claim, and providing for certificates of permanent title, were repealed.

BUTTE.

GRAVEL MINING.—Oroville *Mercury*, June 25: On Sunday laat we viaited the mining claim of George F. Halaey, on the road to the Upper Ferry, and just over the brow of Bridge hill. Mr. Halaey has made a abstantial bed rock flume, about 300 yards in length, extending from near the middle of the river,

from the Corcoran mine, five miles south of Antioch; a road has been built and it is the intention to have coal on the Granger's wharf for shipment within the next two weeks. Mr. Richard Mills, of Somerville, has a lease of the mine for a term of years. Ronse and Hawxhurst are preparing to work the Cuddy & Co. mine, land recently sold by Griffin. When in addition to these, the Tantonia and Marsh Grant veins are developed, Antioch will become an important shipping point for coal.

More Coal.—Contra Costa *Gazette*, June 20: The attention of Mr. Simon Blum was called recently to the fact, that many years ago a very promising vein of coal had been discovered on a portion of the Briones rancho, which now belongs to him. Several sacks of the coal then taken from the vein for trial proved it of good quality; but, either because of uncertainty of title, lack of means or enterprise, the vein was no further tested at that time, and the fact of its existence had almost been forgotten until within a few weeks. From the examinations lately made, the quality of coal and character of the vein, as far as superficially tested, Mr. Blum feels warranted in pushing the examination further, and has determined to run a tunnel that will strike it at such a depth below the outcrop as will be likely to show what it is.

EL DORADO.

Fort Yuma Mining Company. — *Mountain Democrat*, June 26: The Fort Yuma gold quartz mine is located in Agra mining district, El Dorado county, California, about seven miles in a northeasterly direction from the town of Latrobe, and embraces 1,500 lineal feet of the ledge. The mine was first discovered and worked by Mexicans, and was found to contain free gold in such quantities that it paid $20 per day to the hand, although worked by the old process—arrastras propelled by mules. When, however, the water level was reached, it required a more scientific knowledge of mining to continue and further the work, a commodity which the owners did not possess and had not acquired previous to the purchase of the entire property by the present company. Since the acquisition of this valuable mine by the Fort Yuma gold quartz company, a large amount of money has been expended in prospecting and sinking the shaft, which is now down 115 ft, which has developed the mine sufficiently to show a regular vein of gold sulphurets, widening as they descend, which at the bottom of the shaft is four feet in width, and the ore works, by mill process, from $17 to $25 per ton.

INYO.

Coso District —Panamint *News*, June 22: From P. J. McDonnell, who has just come in from Lookout canon, in the Coso district, some thirty miles west from this place, we have the following regarding that new but promising camp. The first discoveries were made here about the latter part of May by Ball, Childs, Boardman and Burke. The ores are urgentiferous, of very high grade, assaying from $60 to $1,100 per ton. The ledges are of great width, and there is every probability that they will go down to great depth. The formation is limestone, but standing upon edge, or nearly perpendicular, instead of lying flat, as is usually the case. Wood is four or five miles from the mines, and in great abundance. Water is within one and one and a half miles in running streams, and is found in close proximity by sinking twenty to thirty feet. The Modoc, located by Ball & Co., is considered to be a very promising mine. The width of the vein as now shown is from twenty to thirty feet. The ore in this mine will average $80 to $400 per ton and carrying forty per cent. of lead. The Lookout, a little lower down in the same mountain, shows equally as well, if not better than the latter, ore being observable throughout the entire croppings. The other mines, two in number, belonging to the same company, bear evidences from the croppings that they too, on development, will equal in value the Modoc and Lookout. In fact, this district, although new, will, without a doubt, soon take rank with the best that have ever been discovered in any portion of the county.

Important Purchase of Mining Property. R. M. Wilson, mining and civil engineer, who visited our camp a short time since, returned a few days ago and has effected a purchase of a mine which bids fair to be as productive of revenue to the owner as any other in this district. The mine is situated at the head of Happy valley, and is an immense argentiferous lead, having in close proximity and easy of access abundance of wood and water. This selection was made by Mr. Wilson, after visiting and closely examining the mines here and at Darwin, and he feels confident that he has acquired a very valuable property. He departed for San Francisco yesterday to perfect his arrangements for building a furnace and entering into the most active operations for developing his mine.

MARIPOSA.

The Pool Mining Company.—Mariposa *Gazette*, June 26: This company, which was organized several months since and incorporated with a capital stock of $10,000, for the purpose of opening and developing several valuable veins of quartz, we are pleased to learn are about to commence work, and are preparing to erect an 8-stamp mill, which will be completed some time during the fall. The veins of quartz contemplated to be worked by this company are in the neighborhood of the celebrated Washington mill and mine, and there is good reason to hope that the Pool mines are equal to any in the county. All that is required is a small outlay of capital, and with proper management these mines will again be heard from as in days gone by, where fortunes have been realized from the out-croppings of several of the veins now belonging to this company.

Washington Mine.—We learn from a correspondent who resides in the vicinity of Hornitos and near this valuable mill and mine, that the company have just finished a run of 4 month's duration, at their chlorination works, on sulphurets concentrated mostly by Schofield's machine; that the result is nearly $20,000, and that the whole cost of concentrating and chlorinating is less than $5000. Surely this speaks well for Schofield's concentrating machine.

NEVADA.

Lucky Find.—*Foothill Tidings*, June 26: Albert Shepard, who owns the lot occupied by the residence of Mrs. D. Newland, Walsh street, on the ridge back of the M. E. church, and lives on the back part of the lot, in clearing off some brush a few days since found a nugget of gold and quartz about as big as the palm of one's hand and about as thick, which contained fully $350 worth of gold. So it seems that all the nuggets are not picked up yet, or were not at the time of this find. It will pay to keep a sharp lookout for many years to come; not to the exclusion, however, of all efforts to turn up something.

Rich Gravel.—The Manzanita mine, near Nevada City, is now opened up by tunnels and drifts, to the extent of four acres of its ground, ready for taking out pay dirt. The editor of the *Transcript* saw on Monday last the proceeds of two parcels of gravel, a pan and a cigar box full, respectively, which had lately been taken out, and says: The former is worth fifty dollars, and the latter thirty. Of course all the dirt is not like that, and probably a small portion of it is. Still these parcels were taken from a piece of ground where the indications were no better than in other places, and in fact the one washing the dirt had no idea of its being so rich. It is, however, impossible to select any of the dirt that will not prospect first-rate. All the work now done in the mine pays. The dead work is all done. Every foot advance adds to the dividends of the company. The success of the Manzanita is a guarantee that other claims on the same channel are good, and that hydraulic mining in this section is in its infancy.

Very Good Ore.—Grass Valley *Union*, June 30: The New York Hill mine is giving forth lots of splendid ore. The ore is so rich that much of it has to be locked up in the vault of a bank. Gold can be seen all through the rock, and the sulphurets are perfectly splendid. The mine is on the biggest kind of a way to a great prosperity.

The Omaha mine, situated near the New York Hill, is also sending out fine ore. Rock taken from the Omaha mine yesterday was as good as any which has yet come from the New York hill. All agree that the rock from the two mines are almost identical as to character, and in richness the Omaha yesterday was equal to the New York Hill. Fine specimens, and big ones, can be seen at Den Meagher's and at Delano's, from both mines.

Gravel Mines.—San Juan *Times*, June 26: The American mining company at Sebastopol, uses 1500 in. of water, day and night. The company is still washing top ground and with very good success. They are pushing their new tunnel to a state of completion very rapidly.

The Milton company, at French Corral, are pushing their tunnel rapidly. Mr. Davis with his Ingersoll drill makes from 80 to 90 ft of hard bed rock tunnel every month, while the hand drillers only make 20.

The Kansas boys, at Empire Flat, utilize about 1000 in. of water daily. Their ground is very rich and their clean-ups very excellent.

The Sweetland Creek mine (Buckeye hill) is now in full blast. They will run thirty or forty days longer and then will make a clean-up. They are now washing rich gravel through their new tunnel.

The North Bloomfield mining company is now washing through two monitors, utilizing about 3000 in. of water daily. In consequence of a choking up at the mouth of one of their shafts they moved their monitor to a point nearer Malakoff. This company has struck a bed of gravel which is a little richer with gold than any gravel ever before struck on the Ridge.

Mining on San Juan hill proper is played out. Most of the ground on the hill belongs to the Eureka tunnel company, a corporation, and to the New England company. Neither of the companies named are worked at present.

The Bed Rock mining company at Birchville, utilize about 1000 in. of water daily, and would use more if they had it. Their clean-ups are magnificent, though not frequent.

The Manzanita mining company commenced cleaning up their sluices on Tuesday last. They anticipate a big haul.

PLACER.

New Quartz Mine.—Placer *Herald*, June 26: A new ledge is being opened by William Werry, about 250 ft north of the Crater mine, on Crater hill, which, we learn, gives every indication of proving fully as good, if not a better mine than the Crater itself. This ledge was first discovered about two years ago, but, until recently, nothing has been done toward its development. A shaft is now down 40 ft, at the bottom of which drifts are run 50 ft each way. The rock taken out so far, averages about $40 per ton. Mr. Werry intends pushing the work of developing this mine thoroughly right ahead, in view of which the necessary outbuildings have been erected, and hoisting works put on suitable to the present depth.

PLUMAS.

The Indian Valley Mine.—Plumas *National*, June 26: We were shown by C. T. Kaulback, Wells, Fargo & Co.'s agent at this place, a bar which was being shipped from Grasaville, weighing $2,700—the last clean-up of the Indian Valley mine under the present management. This mine, which has been running behind for some time, is now paying regularly and well, and its prospects for the future are brilliant. Our old friend, Major Whitlock, is sanguine that he has got a good thing, and we have reason to believe that he is right.

SIERRA.

Forest City Claims.—*Mountain Messenger*, June 26: Times are not quite as lively as they were some time ago. There are not as many men employed by the Bald Mountain company, on account of the failing supply of water. Buildings are still going up quite briskly, and if no fire destroys it, it will not take long for this place to rival Downieville in extent. The Bald Mountain Extension company have commenced operations, building and leveling, and preparing to start their tunnel, indicating they are determined for a siege up to the old mountain that contained its hidden treasures for ages. There is room enough within a radius of six or eight miles of this place to make it one of the richest gold regions on this or any other coast in the mining world. The South Fork are sinking in gravel at the end of their tunnel, and from what I hear it shows every indication of a basin or channel; every one wishes them success. The Bald Mountain company took out a 42-ounce nugget on Tuesday last; they are nice things to look at even if one don't own in them. Sam. Ireland brought in some very rich quartz rock, on Saturday, taken from a ledge at Minnesota. The ledge is 3 ft wide, shows gold all through, and if it continues as it indicates, Sam is a rich man at last.

TULARE.

Mineral King District.—Tulare *Times*, June 26: From an interview with Prof. Moss and Mr. G. W. Brown, who called at our office this week, we learn that prospects of Mineral King district are highly flattering. Prof. Moss has a complete assaying apparatus here now, and is having a building constructed in the district, and will soon be ready to thoroughly test the qualities of the ores. The Professor speaks in the highest terms of the geological formations and says that there is undoubtedly an inexhaustible amount of ore. Mr. Brown is building a saw mill. The building is to be 24x62 ft. He has a number of men at work and calculates to have the mill in operation ere long. He says that water power is abundant. In addition to the great number of leads that have already been discovered, Prof. Moss and Mr. Brown were out prospecting a few days ago when they noticed some float rock, and began to trace it to its source, and seek the lead from which it had been broken off. It appeared to be from a very rich lead. They separated about 500 yards, and began the ascent of the mountain. As they passed up better indications were presented, until finally they arrived near the same place far up the mountains and found the croppings of one of the richest leads yet discovered. It is of the richest kind of antimonial silver. The small specimens that the Professor brought with him will yield $2000 or $3000 per ton.

Nevada.

WASHOE DISTRICT.

California.—Gold Hill *News*, June 24: Only three drifts are now being run in the ore bodies on the 1500-ft. level—cross-cut No. 5, 100 ft south of the Ophir line, cross-cut No. 6, near the line, and a lateral drift which is being run in the ore vein to connect cross-cuts Nos. 4 and 5. The face of this lateral drift has been in the ore for almost the entire week, the car samples of which have given average assays of $164 to $167 per ton, the character of the ore being very even, showing little variation whatever in value. The ore in the face of cross-cut No. 5 is much richer, the car samples averaging from $355 to $365 per ton. The face of cross-cut No. 6 has not yet reached the rich ore.

Consolidated Virginia.—But little has been done during the past week sinking the C. & C. shaft, owing to the flow of water at the bottom, which became too strong for the small pump being used to handle. Larger pumps are being put in, and are now almost ready for use, so that in a day or two the sinking will again be under full headway. The erection of the heavy, permanent hoisting and pumping machinery for this shaft is being pushed to completion as rapidly as is possible.

Belcher.—Sinking the main incline below the 1600-ft. level is making steady and favorable headway, the rock in the bottom blasting out finely. Opening the 1600-ft station, preparatory to prospecting the ore vein on that level, is going rapidly forward. Driving the north drift on the 1500-ft level, to connect with the south drift on the same level from the Crown Point, is making vigorous progress. Preparations for opening up the 1500-ft level for the extraction of ore, is about completed. Daily yield, 500 tons of ore.

Chollar-Potosi. Sinking the new combination shaft is going steadily ahead without change or interruption. Sinking the main incline is progressing at the rate of two feet per day. Driving the south drifts on both the 1150 and 1250-ft levels is making good headway, the face of both still in porphyry. Daily yield of ore from the old upper workings, 85 tons, the assay value of which is about $30 per ton.

Florida.—The drift west, at the 400-ft level, is 160 ft in length, and to-day is in the east clay wall of the ledge 18 ft. Stringers of quartz are being met with which assays good, and the material improves as the drift advances. The new pump machinery works to a charm and in the most effective manner.

Ophir.—Daily yield 150 tons of ore, keeping the mills all steadily running. On the prospecting levels but little progress has been made during the week if we except the east drift being run on the 1700-ft level; the time being mostly occupied in retimbering and necessary repairs to the drifts on the 1600 and 1500-ft levels.

Gould & Curry.—Owing to a break of a wrist of the pumping engine, but little has been done on the 1700-ft level during the week; the water raising in the shaft until the men engaged in running the north drift on that level were driven out and the work stopped.

Sierra Nevada.—Sinking the new shaft is being prosecuted with all the vigor possible, rock in the bottom blasting out finely and the flow of water not interfering with the progress of the work in the least. The new air compressor is nearly completed, ready to start up.

Amazon.—The southeast drift at the first station level, since first cutting the hanging clay way, has penetrated the ledge a distance of 55 ft, at which point a portion of the face, last evening, had again apparently encountered country rock, although a portion was still in ore.

Yellow Jacket.—The 1840-ft level has not yet been completely drained of water, although it is fast being got under control. The south winze on the 1740-ft level is advancing downward at a very rapid rate. Another winze has been started on this level 400 ft north of the south winze.

Buckeye.—The flow of water at the bottom of the shaft is gradually lessening so that it is expected that the sinking can soon be resumed. The south drift, on the 550-ft level, is in a distance of 112 ft, the face in quartz and porphyry, the former carrying considerable gold, but not being sufficiently concentrated in quantities to pay for milling.

Leo.—Good progress continues to be made in sinking the winze. It is now down 131 ft below the main tunnel, the bottom in good working ground. The formation is of the regular Comstock character, and becomes more favorable looking every day.

Baltimore and American Flat.—Opening out and enlarging the 5th, or incline station, at the 900-ft level, is rapidly approaching completion. The quartz and ore body developed by the south drift at the 750-ft level is gradually improving in both the quantity and character of the quartz.

Hale & Norcross.—Sinking the main incline is making good progress. It is now down 150 ft below the 2100-ft level. It is expected that the new and powerful air compressor will be ready to start up in a day or two more, when it is the intention to use Burleigh drills in the shaft.

Crown Point.—Daily yield, 550 tons of ore. The ore producing sections are yielding well, and the mills are kept steadily running. The main east cross-cut on the 1700-ft level is being steadily pushed ahead to cut and prospect the ore vein in that portion of the mine.

North Carson.—Some very promising large seams of quartz have been passed through during the past week, evidently feeders of the main vein.

Lady Bryan.—The face of the west cross-cut, on the 80-ft level, is still in milling ore, although of a little lower grade than that heretofore reported.

Baocks.—The shaft is down a distance of 48 ft to-day, the last 20 ft being mostly quartz of a fine, solid character, containing many large boulders of good milling ore, average assays of which run from $30 to $35 per ton.

Globe Consolidated. — The prospecting drifts west, on the 250-ft level, have developed some bunches of fine quartz, but no ores that will yet pay for milling. There is no change in the strong flow of water on the 400-ft level.

Succor.—Drifting both north and west on the 550-ft level of the new shaft is still vigorously prosecuted, with much more favorable indications of finding pay ore in the face of the west drift.

Caledonia.—The erection of the new hoisting works building and machinery is being pushed to completion with all the vigor possible.

Cosmopolitan.—Under the new management, work in this mine is progressing in excellent style, and it is getting into better working shape. The ore yield is enough to keep the Hope mill running.

Nevada.—The ore body developed by the cross-cut at the lower level, being simply a continuation of that found in the workings above, is of the same excellent character.

Segregated Gold Hill.—The ore developments at the 400-ft level are showing even better than last week, and continue to show improvement in both extent and quality.

South California.—Shaft still progressing downward in good sinking ground. Some very promising feeders of quartz are occasionally met with.

Lady Washington.—The setting of the new machinery progresses as fast as is compatible with the handling of such heavy arrangements.

Justice.—The ore developments of the 400-ft level and south mine are improving in value and importance. Nothing new to report of the 800-ft level.

Mechanical Drawing.

In this article I shall take a strictly professional view of the subject. I shall show the reader that the surveyor engineer, either civil or mechanical, ought to be a practical draftsman, and teach him how to become one.

Drawing is the graphical representation of objects, either real or imagined—imagined in our case expressly for the purpose of being carried out in nature and becoming real. The first practice must be free-hand drawing. All beginnings are difficult, and when you take your pencil in hand and find that you cannot do with it what you want to, you are apt to feel discouraged, and think that to do it requires special talent. Disabuse your mind of this idea; all that is required is the conviction that real work has begun and must be carried on with earnest, thoughtful application. Without this application the most exalted talent will produce comparatively little. Look at some work executed for industrial purposes—for instance, the designs on calicoes, wall-papers, designs for carpets, etc.; try to copy them, or invent some new ones, and you will find that it requires a great amount of practice to produce anything as good. These designs are mostly produced in the factories by young men and women. After a time the girls make excellent draftswomen. They have to work expeditiously, and are certainly not paid as artists. The necessity of supporting themselves has made them thoughtful and industrious, and their training rarely coexists in more than the first practice I recommend, zealously carried through.

After a little intelligent practice you will find that you have more talent than you at first supposed, and the good opinion of yourself will increase your progress, and with it the enjoyment in your work. All of you can become good practical draftsmen, getting more expert in proportion as your profession offers you opportunities to execute drawings. The object of free-hand drawing is to discipline hand and eye, the hand being the more teachable of the two.

I will give an instance to prove that the eye must be educated to see. In running the boundary line between California and Nevada over a very rough and difficult country, I had two flagmen. The first one had to give sights ahead in a straight line, often distant for a mile or more. He had to grope his way through gulches, timber, and over rocks; but where he set up his flag he was seldom more than ten or fifteen feet off the line. He had an educated, keen eye. The hind flagman had to set up on the station just abandoned by the instrument; he had plenty of time to study the line before him, but still he would get lost on his way from one station to the other, and had sometimes to be hunted up by others of the party.

When you look at some piece of machinery, especially if it be in motion, you will find it very difficult to see everything; whereas, when your eye is educated you will perceive the purpose of the construction and understand the thoughtfulness of the arrangement of its parts. The education of the eye begins with that of the hand with your first practice, and therefore I wish to impress upon you that your real work begins therewith.

You should begin with copying simple forms—contour lines from good drawings. I would prefer the forms of nature—forms of leaves, plants, flowers, going from the most simple to the most complicated ones. These will teach you a good deal besides drawing. Copy these forms, correct your copy patiently, and finally, when true, outline them with an even, deliberate line. Drawings of good architectural ornaments, and for advanced scholars portions of the human frame, and finally figure drawing, is excellent practice.

With the brush you will have to practice laying on flat tints in India ink and color, next evenly graduating from deepest shade to light. As soon as you have acquired some experience of hand and eye, you ought to begin to draw from nature the same leaves and flowers you copy from drawings.

In shading, take a cobble stone or shell of uniform color, put it before you and try to reproduce on paper the delicate shading of nature. You will require all your patience and perseverence to vanquish that cobble stone or shell, but when you have succeeded you will have made great progress in your career as a draftsman.—*Manufacturer and Builder.*

New Oregon Mining Company.—The Oregon *Sentinel* says: From Mr. Jay G. Kelly, the mining expert, who was in town yesterday, we learn that the quartz mill which is to be erected on the Gold Back ledge, near Kirbyville, in Josephine county, had not arrived at its destination yet, but that it was on its way from Crescent City, and that he expected to have it up and in running order in about three weeks. This company, which will hereafter be known as the "Oregon quartz mill and mining company," have located and purchased eight or ten different quartz lodges and several placer mines, together with a large number of ditches, flumes, etc., with a view to actively engage in developing the mineral resources of that section. Mr. Kelly has been elected superintendent of the company. This would indicate that the right kind of men have taken hold of the matter at last, and it is earnestly hoped that they will reap a golden reward for their enterprise and activity.

Collapsing Boats.

An interesting series of experiments was lately carried on at Romsey, near Southampton, in the presence of Admiral Sir William Mends, and others interested in saving life at sea, as well as in naval and military operations, with the comprehensive system of collapsing life boats invented and patented by the Rev. E. L. Berthon. The party was conducted round the boat building sheds of Mr. E. P. Berthon, son of the inventor, in which were exhibited a great variety of these boats of different forms and sizes, from the little Arctic sledge boats, seven feet long, to be carried in the expedition which is to start on the 29th inst., up to large boats for emigrants and troop ships. The dimensions of the latter are as follows: Length over all, thirty-seven feet; breadth, twelve feet; and depth, five feet. Along the middle of the boat, the whole length fore and aft, is a locker with convenient hatches, in which is contained half a ton of the best provisions in tins, and a large water tank with a condenser, producing twelve gallons of water daily, in addition to the original supply. In the bow is the chain locker, and in the stern the binnacle, with compass, sextant and general chart. The whole of the stern sheets is covered in with waterproof canvass, affording a snug shelter and privacy for forty women. A boiler for soup, etc., completes this part of the arrangement. The boat is rigged with two lower masts, topmasts, and five sails, the whole of which, with twelve oars, together with the boat itself and all the above named contents, collapses into a space only two feet wide. These boats will never be placed on deck, but lashed outside the ship, from which position they can be detached, expanded and lowered in a few seconds. Each will carry 150 people with perfect safety in any sea, and being provisioned for that number for at least four weeks, there is nothing to hinder its occupants from continuing their voyage, or making for any convenient port. These boats need not interfere with any of those existing in a ship, and they may be carried in any required number without danger or inconvenience. Each boat weighs eighty pounds, and can be carried on a man's shoulder or under his arm, and even these little things would form a bridge for men to cross two abreast. Among other boats of this kind exhibited on the river, including some very pretty yachts' dingies, nine feet by four feet, was one of the Arctic sledge boats. It weighs only thirty-four pounds, and when carried under a man's arm it is only four inches wide. It is opened in three or four seconds, and then becomes so remarkably buoyant as to carry four men, although not intended for more than two. When filled with water it will still carry two men. These experiments are to be made again on the full scale in boats forty feet by twelve feet by four feet, and when collapsed against the side of one of our splendid troop ships, they will not project more than eighteen inches.—*Iron.*

A Copper Wonder.

There is now on exhibition in St. Louis a mass of native copper that is attracting much attention, and which will be exhibited at the Centennial at Philadelphia next year. It was taken from a mine on the Isle Royal, Lake Superior, is heart-shaped, and weighs 6,000 pounds, exceeding by nearly double the weight of the famous copper boulder which was transported many years ago from the same region to the Smithsonian Institute, at a cost to the government of $5,840. The specimen exhibits the pure copper to the eye, and contains ninety-eight per cent. of the metal. It was taken from an ancient mine about seventeen feet below the surface, and when found had evidently been detached from its bed by the ancient miners. A number of pieces of copper besides the mass were found, weighing from an ounce to seventeen pounds, evidently clipped by the old miners. Stone hammers weighing from ten to thirty pounds have also been found by the hundred, either perfect or broken from use. To what race these ancient miners belonged and at what period they flourished, can only be conjectured. Probably they belonged to the prehistoric mound builders, who worked in metals long anterior to the Indian races. At least, numerous evidences of their occupancy were discovered by the early Jesuit explorers, while specimens clipped by them from the copper rocks have been found scattered over nearly the whole country.

Saxon Mines.—The following memorandum from the last report of the condition of the mines in Saxony may be interesting: There are in the Freiberg district 98 mines. Of these 16 are paying; 20 are working and producing, but not paying; 23 are working, but not producing any mineral; the balance are abandoned. The mines employ 5,747 miners and laborers, and 535 occasional laborers. The value of the silver and lead product, the latter being small, for the year 1873 was 1,527,847 thalers, or $1,110,050 coin. The average production of each man was 227 thalers, or $167.44, less than 56 cents per day. If from this the profits of the mine are to be deducted, it leaves about 50 cents per day for labor. Small as the production of this well known district is, it would be far less were it not for the very economical working of the mines and the saving of every ounce of mineral, by every appliance for concentration which experience and ingenuity can devise. In the mining schools at Freiberg there are 114 students, of whom 25 are Americans. —*Mining Review.*

Railway Reflections.

Has not the railway affected, influenced, altered, yea, directed, the drift—the direction, of human thought? We are all influenced by the circumstances that surround us. Who is there that is independent of the material or social phenomena of his time? The mode, manner, and style of locomotion used by man influence his being, mold his character and affect his habits of thought and action. The fashion of our motor power controls our feelings and affects our emotions. To mount the horse is to partake of his nature—to sympathize with his spirit, bound, curvet, or caper, as his sportive mood may suggest. When we are seated in the railway carriage do we not mentally snort in accord with the iron steed—take pride in his speed, and glory in the force with which he devours distance? How different is the feeling of a man who is carried in a palanquin, or towed in a canal boat, from that of one who is whirled along in an express train, with a telegraph caution ticking in front, and a way train whistle screaming in the rear!

The railway has enforced habits of promptitude, illustrated the value of time, and shown the power of discipline. On the disk of our railway dial no shadow is allowed to linger. Our time tables are as absolute as the laws of the Medes and Persians; the locomotive has employed our legislatures to devise new codes of laws for its government, and engaged our judges in interpreting its rights and privileges. Into every grade of modern society the interest of the railway has extended.

The multitude of engineers, mechanics, workmen, clerks, and conductors who are kept employed in this service would be difficult to estimate; they constitute a large section of the population, a standing army of industry; and what an enormous supply of iron, timber, coal, oil, and other natural products the railway demands every year! In the manufacture of its necessary supplies, how many new trades have sprung up and are supported!

The property of our railways dominates the money market of the country. The capital of our time has run so largely into railways that every one who owns any surplus may be said to have an interest in railway property. It would be interesting to calculate the proportion of capital invested in railroads, as compared with banking, manufactures, insurance, or even agriculture.

As the overflow of the Nile enriched the plains of Egypt, so has the flood of railways over the land enhanced the value of the soil. The locomotive has virtually irrigated barren wastes, actually tempered the climate of inhospitable regions.

Probably no interest has been so largely promoted by the railway as that of real estate. Every farm has felt its influence. It has brought a market place to the farm of every husbandman, a customer to the workshop of every mechanic. Families are re-united; friendships maintained; intercourse established by the facility of railway travel. We eat, drink, sleep, live on the railway.—*The Railway World*

Owners Visiting Mines.

The Tuolumne *Independent* says: We note the visit this week of some of the principal owners of several of the gravel and quartz claims in Tuolumne county. It is meet and proper that those who have aided such enterprises by their time and capital, should at least once a year inspect for themselves the progress made and for what the money has been expended. A conscientious and thoroughly practical superintendent (and even the hardy delving workman) feel encouraged when receiving due praise for their solid, *telling*, steady work—judicious and economical expenditure—when personally expressed on the spot after proper examination.

It is idle to say San Francisco men can glean nothing by a short tour of inspection of the mines in which they are interested, simply because they "know nothing of mining." They can see with their eyes—hear with their ears much that they never would see or hear unless they did thus visit the neighborhood and the "location of works."

Among visitors this week were some of the co-owners of the Table Mt. B. G. Co.; the T. M. Alpha; the Marks & Darrow Q. Co., and several others. One of the *attaches* of our paper waited upon (we don't profess to understand the modus operandi of "interviewing") the gentlemen upon their return to Sonora and was assured of their perfect satisfaction in all essential respects—as to judgment and economy in the prosecution of the work, and, so far as they heard and could judge—as to the thorough practical manner in which the present developments have been brought about. They appear to be quite elated as to the present and future prospects thereof. Their visit having been unheralded, the superintendents were taken quite unawares. Several blasts were put in during the day and they had an opportunity of picking up the quartz in pieces averaging some twenty pounds, showing visible gold and rich sulphurets. One or two of the party confess they smelt (giant) powder, (midst thunder, lightning, snow, hail and rain) for the first time—considerably underground — in shafts and drifts. We hope such visits will be oft repeated—with equal satisfaction.

English Oak for Spokes vs. Hickory.

A great deal of the mistrust which is often to be found in the minds of workmen, respecting the information to be derived from books and papers, upon their own trades, is not without some foundation. If this mistrust be traced to its source, it will be found that the writers in question are oftentimes not acquainted with the practical parts of their subjects as practiced in the workshop; and therefore errors creep in, as almost every day's reading unfortunately proves. These, when observed by workmen as being directly opposed to experience gained by years of practice, are the first things laid hold of, and produce an unfavorable impression regarding all kinds of book learning, very difficult to eradicate. The subject of timber is one that has often been handled by scientific writers, and many extraordinary statements have been made respecting the various properties of the different kinds, which statements are entirely at variance with the teachings of every-day life. Numerous instances might be given, but my present intention is to give facts respecting British timber, gathered from practical observation, rather than a collection of errors.

Out of the many different species of wood used in British carriage building, the oak and ash are usually taken as the representatives, and, together with a slight spice of elm, form the principal woods used for the more important parts of carriage frame work. In England, no tree is held in such esteem as the oak, and there is none more deserving, for in whatever light oak may be considered, it appears to advantage.

In carriage building, the parts to which English oak is most adapted are the spokes, and no country has as yet produced a material to equal it in this respect. Hickory may excel in some respects, but for general good qualities nothing equals the oak. The way the oak is converted into timber at present is not such as to produce the most valuable wood, but to secure the most profit to the owner. If the tree were to be cut down in winter, as it ought to be, the bark would adhere so firmly as to become almost part of the wood itself, but when the value of the bark is about a third or more of the timber, it makes it worth while to sacrifice some of the value of the timber to secure the bark.

A cross-section of an oak tree shows, in addition to the growth, two distinct kinds of wood. Nearest the center the wood has a red aspect, and is known as "heart of oak;" the outer part is called the sap, and as the tree is cut down in spring, when the sap is up or running, the heart and sap are as widely different in their natures as if they belonged to two distinct species.

With the exception of oak and larch, scarcely any trees are here cut down in spring or summer for timber purposes, as these two trees are the principle if not the only ones whose bark is made use of. The bark of oak is of sufficient value to make it worth while peeling all parts, from the trunk down to almost the smallest sticks, and the wood or plantation where barkpeeling is going on is a scene of lively animation, from the number of young persons of both sexes employed.

The best method of preparing the oak wood for spokes is a subject whereof many various opinions are expressed by old experienced "spoke-haggers."

Some recommend that the timber ought to be buried in dry soil for a short time, while others hold that it ought to be soaked in fresh water; but the object in view is simply to get rid of the natural juices as expeditiously as possible, without injury to the wood in the shape of cracks or shakes. The simplest, and perhaps best way, is to cross-cut the tree into the required spoke lengths, and afterwards split up the pieces by wedges into sizes, which, after rough dressing and the shrinkage of drying, are large enough for ordinary spokes. The line of cleavage is very important, and to secure the best spokes it must not be taken at random, but must be through the medullary rays, or those easily discerned growths, which, in oak particularly, are found radiating from the pith like the spokes of a wheel. While the spokes are still green, they are roughly dressed up with an ax, and are ready for storing by to dry. The above is not so economical a method as sawing out the spokes, but it is without doubt the best; for with the medullary rays running from back to front of spokes, the fiber is considered to be in the best position for strength. Sawn spokes have not this advantage; and, moreover, they have a bad name, through wood being often cut into spokes that is quite unfit, through crossness, for that purpose.—*Carriage Maker.*

The Egyptian Blue.—It seems, as might reasonably be expected, that modern chemists are quite certain to rediscover the famous Tyrian purple and Egyptian blue of the ancients—colors which have stood the test of thousands of years of time, without any apparent diminution in their beauty. The probable production of the former has already been announced, and now it appears that M. Peligot, a French chemist, claims to have rediscovered the latter, a shade of blue which is conspicuous in many of the ancient ornaments found in Egypt. He has analyzed some of the enamel, then by synthetical experiments has succeeded in ascertaining the proportions of silica, oxide of copper, lime and soda that will produce the marvelous compound.

Useful Information.

Who First Made and Named Kerosene.

A correspondent mentions to us that the word "kerosene" originated with the Downe Kerosene Oil Co. of Boston. This is an error. It was Abraham Gesner, who, in 1844, distilled an oil from coal in Prince Edward island, and who was the first to give it the name of kerosene; while James Young, of Glasgow, introduced this manufacture into England. It was in 1847 that his attention was directed to the extraction of an oil from the petroleum which was found in a coal mine in Derbyshire; and when this was exhausted, he distilled the oil from Boghead cannel coal, and was quite successful in making, in 1854, 8,000 gallons of kerosene a week, which sold for five shillings a gallon, making half a million dollars per year, much of which was clear profit.

This result increased the coal-oil works in England, while in the United States the first coal-oil works were erected, in 1854, on Newtown creek, Long island, by the Kerosene Oil Co., working under the patent of Mr. Young, who had also taken it out in the United States. In 1856 the Breckenridge coal-oil works made kerosene from the cannel coal found there; and the same was done in Perry county, Ohio. In 1860 there were not less than twenty-five such factories in Ohio alone. The establishments along the Atlantic coast produced 200,000 barrels, while the total value of the kerosene thus produced was estimated to be over two million dollars.

Then the petroleum excitement came, and all the establishments commenced to make kerosene from crude petroleum instead of using coal. Kerosene being the only article for which there was any demand, the benzine sold at a very low price, while for the gasoline no price whatever could be obtained, so that in 1861, the largest works then in existence in the United States, those of Cozzens Brothers, in Greenpoint, Long island, burned the gasolins all up by conducting it through a pipe to a safe distance and discharging it in a swamp, where in this way a large fire was kept up, burning night and day for a long time.

Popular Science with a Vengeance.—It is one of the most hopeful signs of the times that everybody is now supposed to know a little science. Some of us know a very little. Others know a good deal, but the arrangement is somewhat confused. We scarcely know to which class the compiler of the "Yorkshire Exhibition Guide" belongs. Whatever amount of scientific knowledge he possesses, he certainly has the art of "combining his information" and presenting it to his readers in a fresh, cheerful and interesting manner. He says: "A medal and plate formed of the new metal, palladium, will be interesting to scientific men. The discovery of this metal a few years ago by Professor Graham finally settled the long disputed point as to whether or not the gas hydrogen was a metal. He proved that palladium was simply hydrogen condensed. This may be easily exemplified by placing a piece of the metal under the receiver of an air pump and exhausting the air. The solid metal at once flies off as a gas, and on readmitting the air it shrinks again into its former size. The little medal shown contains 100 times its volume of the gas." We will only add, in transferring this gem to our columns, that we hope it is not a fair sample of the teaching at the Leeds Mechanics' Institute—the worthy object for whose benefit the Yorkshire exhibition is being held.

Death Belts.—Frequently, in cases of shipwreck, especially in comparatively smooth water, life belts would furnish a means of temporary safety until boats were got ready on shore. They would have done so in the case of the *Northfleet*, and in the still more recent instance of the *Schiller*. But the life belts must be genuine, and not pretexts for the purpose of figuring in advertisements as proofs of the care taken by the owners for the lives of their passengers. Those found upon the bodies of the *Schiller's* victims appear to have been of the latter sort, consisting, as they did, of a few slabs of cork fastened together and to the person by one or two pieces of tape, and were thus worse than useless to a good swimmer; for it is stated that those who recovered the bodies declare that in very many instances they were found with the head under water and heels in the air, showing that the belts had really drowned instead of supporting the unfortunates who had trusted to them, by dropping down towards their hips. In this way scores of dead bodies were picked up in the water wearing belts which, if properly constructed, would have saved the life of the wearer.

Paper Stock.—Rice grass is now being introduced from Canada for use of Eastern paper makers. The article is pronounced fully equal to rags. It makes paper that is superior for printing clear impression. It is said that rice grass is found in the Northern States, and probably it grows in California. Surely it can be cultivated here. There is no reason why we cannot make our own paper; for labor is not an obstacle to success in such manufacture.

At the Atlas works, Pittsburg, Pa., they are making the largest shears ever constructed in this country. They will weigh forty tons, and will shear cold iron five inches thick.

To Make Lead Pipe Safe to Use for Drinking Water.—It is very generally known that lead is more or less acted upon by drinking water, and thus rendered unsafe to use for conducting the same for any great distance. Tinning on the inside has been employed as a remedy for the evil; but on account of cost or for some other reason, such pipe has not come into very general use. What is supposed to be a better remedy has been patented by Dr. H. Schwartz, of Breslau. His device consists in treating lead pipe for ten or fifteen minutes with a two to five per cent. solution of sulphuret of potassium or sodium, at a temperature of 212°. A boiling solution of sulphur in caustic soda is found to answer the same purpose. This treatment causes the formation on the surface of the pipe of a thin coating of sulphuret of lead.

A strong proof of the insolubility of sulphuret of lead is the fact that water from galena mines never contains a trace of lead. Still, a doubt might arise as to the equal power of the artificial sulphuret to resist the action of water. Fortunately, here, too, we have experimental proof to rely upon.

The *Chemical Bulletin*, of Paris, refers to a series of experiments with pipe coated after the method of Dr. Schwartz. These pipes were exposed, at the same time with other unprotected pipes, to the action of rain water, snow water, distilled water and the city water. On the following day he found a perceptible quantity of lead in the water which ran through the unprotected pipes, except in the case of city water, where traces of lead were found after a few days. For three months, however, and in the presence of air, the coated pipes did not contaminate the water flowing through them.

For the benefit of those interested in Schwartz's process, we would say that the details are given in the specification of patent No. 1519 of the British Patent Reports for 1863.

Gas Wells.—Our predictions of some years since—generally deemed at the time fit matters *de lunatico inquirendo*—as to the immense national importance of *natural gas* in the near future, are being slowly but surely verified. Among the numerous statements is one that borings for oil on the Red Bank creek, far east of the Butler oil field, gave torrents of gas. A Western Pennsylvania paper tells us also that "a number of wells will be put down in Beaver valley for natural gas. Messrs. Blake & Fessenden intend putting one down for the use of their file works. The owners of the paper mill at Beaver Falls intend putting one down also, and it is rumored that a company have leased the wells at Bennett's Run, to convey the gas to Beaver Falls, where it will be furnished for fuel." We also learn from Pittsburg, May 13th, that "a line has been surveyed, along which it is proposed to run a six inch pipe for the purpose of conveying the natural gas from the well near Sarversville, Butler county, to this city. It has been estimated that this size of pipe can carry a million feet of gas every twenty-four hours."

Petroleum Fuel.—All steamers navigating the Caspian Sea burn petroleum exclusively. A blast of steam gives the liquid petroleum even distribution under the boilers. Some contending patentees exhibited some systems of this sort here, three or four years ago; but something seemed imperfect, for petroleum has not come into use. As petroleum oil is abundant in Santa Barbara and elsewhere in California, it may profit our State to inquire into the process which proves successful elsewhere in California.

A Milanese lady, after long study and toil, has invented a process to spin the gossamer threads from cold cocoons, which affords considerable advantages on the old method of using heated water, viz.: Less space, no coal, less trouble for the spinner, and greater strength in the silk obtained.

Condensed air, as a street car motor, has been abandoned in New Haven. Horse power is more profitable.

Good Health.

Nelaton's Treatment of Boils.—A French medical journal says that Nelaton for more than twenty years prescribed the use of alcohol for the prevention of these smaller abscesses, which are so common amongst young people, and which so seriously impair the beauty of the face. It appears that this treatment is now extending, as some interesting details are to be found in a communication of M. Simon de Forges, of Sainte-Foartaine, which appears in the *Revue de Therapeutique*. In speaking of boils, small outward abscesses, and other inflammations of the epidermis and of the derma, he observes that as soon as the characteristic circular redness appears on any part of the body, whatever may be its size, with a point rising in the middle, making it a grayish white, a thimbleful of camphorated alcohol should be poured into a saucer; the palm of the hand should be wetted with it, and this should be rubbed with a gentle friction over the affected place. The fingers should be again steeped, and the friction continued as often as eight or ten times every half minute. The place should be well dried, and before covering it up a little camphorated olive oil should be applied to prevent the evaporation of the fluid.

Duration of Human Life.

The opinion has become very prevalent among many that of late years human life has become shortened beyond what it was a thousand or two or three hundred years ago. But well authenticated facts contradict such opinions.

It is stated, in a recent German periodical, that while in Republican Rome the average duration of life among the upper, always the longest lived classes, was only thirty years, among the same classes in the present century it reaches fifty years. In the sixteenth century the mean duration of life in Geneva was 21.21 years; between 1814 and 1833 it had reached 40.68 years, and at the present time as many people live there to the allotted term of seventy as three hundred years ago lived to forty-three.

The rapidity with which the mean rose in England, even in its earliest period of extension, is shown by the comparison of two financial transactions in that country, one in 1693 and the other in 1790. In the former year Government made considerable profit by borrowing a large sum of money on terminable annuities, based on the mean duration of life at that time; in the latter another loan, based on the same tables, resulted in a serious loss. The average duration of life in England at the present day is about forty years for males, and forty-two for females. The ratio is of course higher among the better-to-do classes, lower among the working classes and the poor. The aristocracy and annuitants are exceptionally long-lived; and a much larger number of people than is generally supposed reach the age of one hundred years and upwards.

There can be no better test of the amelioration which we owe to modern civilization than the increased length of man's earthly span as compared with the age attained in ancient and mediæval times.

Lime Vapor in Membranous Croup.—Dr. John Bartlett, in the Chicago *Medical Examiner*, recommends the following method of using lime vapor: The patient is placed in a tent extemporized with bedclothes and clothes horse. In this is placed a tub, and in the tub a bucket, filled with hot water. Patient being seated in the tent with nurse, unslacked lime is dropped into the water. From time to time the physician estimates the state of the vapor, increasing the steam and lime by dropping into the water pieces of lime. The quantity of lime required is large. The doctor's experience in the use of this bath has been a happy one. The onward march of the disease seemed checked at once, and a real improvement to take place.

Nervous Sympathy.—Our readers have no doubt noticed the verification of the phrase "gapes are catching," and it would seem by the following singular statement that fainting is catching also: "A young lady recently, while in conversation on matters verging on the horrible in Strouse's corset factory, New Haven, with a number of comrades, fainted. Singular to say the faint was contagious, and girl after girl fainted, and even one man employed in the shop succumbed. How long this would have gone on, it is impossible to say. Mr. Morris, the foreman, ordered a stoppage of work, and thus ended this singular and unparalleled demonstration of nervous sympathy."

A Cheap Fumigator.—The following will be found to be a cheap and pleasant fumigator for sickrooms, diffusing a healthful, agreeable, and highly penetrating disinfectant odor in close apartments, or wherever the air is deteriorated. Pour common vinegar on powdered chalk until effervescence ceases, leave the whole to settle, and pour off the liquid. Dry the sediment and place it in a shallow earthen or glass dish, and pour upon it sulphuric acid until fumes commence arising. This vapor quickly spreads, is very agreeably pungent, and acts as a powerful purifier of vitiated air.

Another Method of Making Cod-Liver Oil Palatable.—Mr. P. L. Simmonds, in the London *Chemist and Druggist*, suggests the following: Take equal parts of ground coffee and bone black; mix them in ten times their combined weight of cod-liver oil, and digest for half an hour at a temperature of about 130° Fahr.; then place the mass on a filter and drain the oil off, and you will have its nauseous taste changed into a pleasant coffee flavor.

Cure for Hydrophobia.—M. Lebeau, a veterinary surgeon of Paris, claims to have discovered a cure for hydrophobia, and submits the cure to an experiment, as follows: On the 23d of May he inoculated with hydrophobia virus sixteen dogs, in a hospital. Eight of these dogs will be kept securely without treatment; the other eight will be treated with the remedy, and the practitioner is confident that that his eight will remain sound, while the others will die.

Candles for Invalids.—Pulmonic candles are obtaining great favor in England. By mixing benzoin and storax with stearine, a delicious balsamic aroma is given out by the burning candles. This gives relief to lungs diseased, and its fragrant incense is grateful to the olfactories of the faithful generally—sound and unsound.

Good Advice to a Dyspeptic.—A gentleman saw an advertisement that a receipt for the cure of dyspepsia might be had by sending two postage stamps to the advertiser, and the answer was, "Dig in your garden and let whisky alone."

Domestic Economy.

Buckwheats and How to Make Them.

Buckwheat cake, properly made and of suitable ingredients, is not only a very harmless little circular institution when decently and rightly dressed, but a very excellent and healthy adjunct to the morning meal for five or six mouths of the year as well. I would not, however, and do not, make them from buckwheat alone, for the simple reason that they are not so good by half, leaving the question of hygiene out of the account. My cakes are made of buckwheat flower, Graham flour from white wheat, and wheat middlings equal parts, or the two former in equal proportions, and I am of the opinion that no other combination of grains or meals now known can surpass this for the purpose intended. A little oatmeal in place of the middlings does well, but it is not so good. We think our cakes are always good when they have had proper attention, and I will submit the formula to your readers for confirmation.

Always mix in a covered earthen jar, with suitable spout for pouring, and never in tin. Mix at bedtime one quart of the flours and in the proportions above mentioned; three tablespoonful soft yeast; a teaspoonful salt; sufficient buttermilk or other sour milk to make a rather thick batter. Let this stand in a moderately warm place until morning, and when wanted for use, thin slightly with cold water, add a teaspoonful of saleratus or soda, and bake immediately over a brisk fire to Aunt Chloe's "golden brown," and serve pretty warm, with the baking heat slightly diminished, and by no means steam them under a tin, and wait till all are baked before eating, as is frequently recommended. Then if a little gravy is relished no harm will ensue, if properly made, but there is a vast difference between lard oil and a juicy meat gravy. If syrup is used, pure sugar drips, or better still, maple syrup if obtainable should be used, and not salphuric "golden drips," which has recently found its way into the market and is poisonous. When the batter is once started as above, and cakes desired each morning, all you have to do is to leave a small portion of the batter each time, let it stand over night as before, and add the necessary flour, milk and saleratas in the morning and the trick goes on repeating itself admirably and only needs entire renewal at long intervals—*Country Gentleman.*

Put Flowers on Your Table.

Set flowers on your table—a whole nosegay if you can get it, or but two or three, or a single flower, a rose, a pink, a daisy. Bring a few daisies or buttercups from your last field work, and keep them alive in a little water; preserve but a bunch of clover, or a handful of flowering grass—one of the most elegant of nature's productions—and you have something on your table to remind you of God's creation and give you a link with the poets that have done it most honor. Put a rose, or a lily, or a violet on your table, and you and Lord Bacon have a custom in common; for this great and wise man was in the habit of having flowers in season set upon his table, we believe, morning, noon and night—that is to say, at all meals, seeing that they were growing all day. Now here is a fashion that will last you forever, if you please—never change with silks and velvets and silver forks, nor be dependent on caprice, or some fine gentleman or lady who have nothing but caprice and changes to give them importance and a sensation. Flowers on the morning table are especially suited to all. They look like the happy wakening of the creation; they bring the breath of nature into your room; they seem the very representative and embodiment of the very smiles of your home, the graces of good morrow.

Two Good Recipes.

We clip the following from the correspondence of the Germantown *Telegraph:*

Stewed Water-Cresses.—It may not be generally known that water-cresses are very delicious when stewed. They should be placed in strong salt and water to free them from all insects, after which they should be carefully picked over, all the water drained off, and then put into a stew pan with a lump of butter and a little salt and pepper—a few minutes will suffice to render the cress quite tender. A little vinegar may be added just before serving, but this must be according to taste. The cress stew made thin, as a substitute for parsley and butter, will be found an excellent adjunct to boiled fowl.

Scrap Pudding.—Put the scraps of bread, crust and crumb, into a bowl with sufficient milk to cover them. Cover with a saucepan lid or a plate, and put into the oven to soak about half an hour. Take out and mash with a fork till it is a pulp; then add a handful of raisins and as many currants, a teaspoonful of brown sugar, half a cup of milk, some candied lemon-peel and one egg. Stir up well, grease a pudding dish, and pour the pudding in. Grate over a little nutmeg, put into a moderate oven, and let bake for an hour and a half.

A Good way to clean black kid gloves is to take a teaspoonful of salad oil, drop a few drops of ink in it, and rub it over the gloves with the tip of a feather; then let them dry in the sun.

MINING AND SCIENTIFIC PRESS.

W. B. EWER.....SENIOR EDITOR.

DEWEY & CO., Publishers.

A. T. DEWEY, W. B. EWER, GEO. H. STRONG JNO. L. BOONE

Office, No. 224 Sansome St., S. E. Corner of California St., San Francisco.

Subscription and Advertising Rates:

SUBSCRIPTIONS payable n advance—For one year, $4; six months, $2.26; three months, $1.26. Remittances by Registered letters or P. O. ordere at our risk

ADVERTISING RATES.—1 week.	1 month.	3 months.	1 year.
Per line.....	.25	.80	$2.00	$5.00
One-half inch.....	$1.00	3.00	7.60	24.00
One inch.....	1.60	4.00	12.00	40.00

Large advertisements at favorable rates. Special or reading notices, legal advertisements, noticee appearing in extraordinary type or in particular parte of the paper nserted at special rates.

SAMPLE COPIES.—Occasionally we send copiee of this paper to persons who we believe would be benefited by subscribing for it, or willing to assist us in extending its circulation. We call the attention of such to our prospectus and terme of subscription.

San Francisco:

Saturday Morning, July 3, 1875.

TABLE OF CONTENTS.

GENERAL EDITORIALS.—The Union Iron Works, Page 1-8-9. Volume Thirty-One: Flume Battery for Hydraulic Mines; "The Glorious Fourth;" Notices of Recent Patents, 9. Bifle Shooting; General News Items; Patents and Inventions, 12.

ILLUSTRATIONS.—Union Iron Works—Prescott, Scott & Co., 1. The Agricultural Building at the Centennial, 9.

CORRESPONDENCE.—London's Lose, San Francisco's Gain; Plumas County Mines; Bald Mountain Mining District, 2.

MECHANICAL PROGRESS.—Resistance of Woods to Torsional Strain; A New Use for Cast Iron; Steel for Bells; Band Saws vs. Circular Saws; The Bessemar Channel Steamer; Perpetual Motion Under Government Patronage; Bessemer Steel in Sweden; Steel Direct from the Ore, 3.

SCIENTIFIC PROGRESS.—The New Discoveries in Regard to Light—Tha Impact (?) of a Luminous Ray; Meteoric Dust; Action of Electricity on Iron; Fat Decomposed by Salt Water; Spectrum of Coggia's Comet; Meteorology, 3.

MINING STOCK MARKET.—Sales at the San Francisco Stock Board; Notices of Assessments; Meetings and Dividends; Review of the Stock Market for the Week, 4.

MINING SUMMARY from the variouo counties in California and Nevada, 4-5.

USEFUL INFORMATION.—Who First Made and Named Kerosene; Popular Science with a Vengeance; Death Belts; Paper Stock; To Make Lead Pipe Safe to Use for Drinking Water; Gas Wells; Petroleum Fuel, 7.

GOOD HEALTH.—Nelaton's Treatment of Boils; Duration of Human Life; Lime Vapor in Membranous Croup; Nervous Sympathy; A Cheap Fumigator; Another Method of Making Cod-Liver Oil Palatable; Cure for Hydrophobia; Candlee for Invalids; Good Advice to a Dyspeptic. 7.

DOMESTIC ECONOMY.—Buckwheate and How to Make Them; Put Flowers on Your Table; Two Good Recipes, 7.

MISCELLANEOUS.—Monterey County Mines; The Great Mines, 2. Mechanical Drawing; New Oregon Mining Company; Collapsing Boats; A Copper Wonder; Saxon Mines; Railway Reflections; Owners Visiting Mines; English Oak for Spokes vs. Hickory; The Egyptian Blue, 6. Industrial Items; Progress at the Sutro Tunnel; Monthly List of Scientific Books, 12.

Volume Thirty-One.

With our present issue we commence the thirty-first semi-annual volume of the MINING AND SCIENTIFIC PRESS. We shall still continue as heretofore to spare no labor or expense to keep up and add to the well earned reputation which the paper now enjoys, and shall use our utmost mesus and endeavor to render it still more useful and acceptable to the miner, mechanic and general reader. We make no apology and feel no delicacy in asking and urging upon the friends of the paper, everywhere, to aid us in extending its circulation, or in calling on them to assist us in filling our columns with facts and information which shall be of value to our readers in the several departments of practical knowledge to which the paper is devoted. We return sincere thanks for past favors and earnestly solicit a continuance of similar ones in the future.

The rapid strides which are now beiug made in scientific mining on this cosst, and the new discoveries and improvements which the ingenuity and experience of man is constantly soaking to apply to mining operations, renders the existence of a journal exclusively devoted to such specialties an indispensable requisite to every miner and mill man who desires to keep himself posted on the progress of the chemistry, metallurgy and mechanics of mining. The wonderful discoveries and marvellous deeds which are now being almost daily achieved in the domain of science and art, render serial scientific and class publications the mainstay and dependence of every person who wants to keep up with the times. The achievements of the past few years are great enough, but who can tell what a year will accomplish? Books are useful only as a record of the past—the living, active, present can only be found in the pages of the newspaper or magazine.

With these facts before us may we not look with confidence to the active assistance of friends? It will readily be recognized that the greater the income, the greater will be our facilities for collecting and disseminating information which shall be useful to our readers. We acknowledge a desire to continue to publish a creditable journal in San Francisco, devoted to the mining and mechanical interests of the Pacific coast. We trust that the friends of the paper will swell our already large list to double its present proportions. We can assure them that if they will do so we shall increase the value of the paper without increse in price. The files of the paper speak for it, and those who will take the trouble to examine them will find not only the current mining news from all quarters of the coast, but very full and reliable descriptions of all new mechanical improvements, metallurgical processes, new districts, etc., etc. We shall continne to improve the paper and ask the co-operation of the intelligent, progreesive citizens of the Pacific coast to aid us with their pens as far as possible, and otherwise assist in maintaining a paper which will be a credit to the interests to which it is devoted.

Flume Battery for Hydraulic Mines.

Many of our hydraulic claims are composed of a hard blue cement or clay, in which the pieces and particles of gold are contained. During the process of hydraulicing, many large pieces of this hard cement get into the flume and are carried away with the refuse or tailings, in an unbroken condition, so that whatever gold there may be contained in the lump is lost. To obviate this, Daniel F. Hawks, of Timbuctoo, Yuba county, California, has invented, and patented through the agency connected with this office, a battery or crushing apparatus by which the undesolved pieces of cement which attempt to pass through will be thoroughly broken and pulverized while on their way through the flums.

The invention consists in constructing at some point in the length of the flume, a stamp battery similar to an ordinary stamp mill. The stamps are arranged diagonally and alternately across the flume, so that whatever might escape one line of stamps will be oparated upon by the alternating stamps or the next diagonal line. This arrangement necessitates the placing of some of the stamp stems further from the cam shaft than others. It is therefore necessary to make the operating cams longer for some of the stamps than for others. The dies are imbedded in the bottom of the flume so as to rest above or on the cross timbers which pass across under the flume. The inventor's idea is to construct the bottom of the flume where the battery is, in a series of steps, so that each stamp or row of stamps will strike upon a different step, thus providing a series of benches for the stamps to operate on.

In order to get rid of the large stones and boulders which are constantly passing into and through this class of flumes, and which would, if allowed to pass through the flume battery, prevent its successful operation, the inventor constructs a turn-out or side flume, leading from the main flume, and in this turn-out flume the battery section is placed. This turn-out flume branches off from the main at some suitable point, and after making a detour again enters the main flume at a point below. At the point where this side flume branches off from the main flume, a number of parallel bars are placed in the bottom of the main flume, so as to form a grating or "grizzly," through which the large rocks or boulders cannot pass, while the water, earth or cement and smaller stones will fall through into the turn-out flume and be carried through it. After the water and stuff passes through the side or turn-out flume, it is again brought into the main flume, while the boulders which were screened out will again intermingle and pass down the main flume with the dirt, etc., assisting to disintegrate the cement.

In order to prevent the stamp steme from being broken or bent by striking on such rocks as will necessarily pass through the side flume, each of them is passed through a rubber cushion on the top of the flume. These elastic cushions are large enough to provide the desired side yield, and are firmly secured in an opening on the top of the sluice. A metal bushing or tube is fixed in the center of each cushion and the stamp stem passes through the tube. By means of this arrangement it will be difficult for any large lumps of clay or cement to pass through the battery section without being crushed. As many stamps as necessary to properly crush the earth or cement can be used, and their weight and arrangement can be varied according to the necessities of each case. Some device of this kind has long been wanted by hydraulic miners.

CORRECTION.—The vicious little typographical error, whereby the title to Mr. Bowman's paper on "*The Great Plunge in the Tertiary*," in our last issue, was made to read ridiculously "*on* the Tertiary," will of course be ascribed to types by the intelligent reader; as also the word convergence, erroneously printed, when it should have been emergence.

WHEN they strike poor ores in the mines nowa-days, they say it is rich, but "not sufficiently concentrated to pay for milling." That is the long way of saying "low grade ore."

Continued from Page 1.

punching the work produced is so accurate as to remove all necessity of pin drifting, which is so injurious to the boiler. All sheets are planed before being rolled, thus preventing injury to the boiler—which often occurs in the old system of hand chipping and caulking—and by a new system of csulking a larger body of iron is set down, making a more substantial job and preventing injury to the under plate. By the adoption of these new improvements and the use of the best skilled labor under intelligent foremen, this department has been brought to a high degree of mechanical perfection, and the work turned out has no superior. There are seventy-two men in the boiler shops, in charge of Levi F. Cole, who has been at the works since 1864.

In The Flask Shop

All the wooden flasks and wooden work appertaining to a large foundry are prepared. Great expertness and promptness are required in this department, which is connected with that of the molders, the men being enumerated with those in the foundry. The flask shop is in charge of Joseph Burke.

The Tool Shop.

Here the tools are all kept and repaired. When the men take tools from here they are charged with them, and become individually responeible, and if they are not returned the missing tools are charged to those persons who took them from the shop. When a mechanic is through with any tool or tools, he returns them to this shop, so that everything in this line is kept track of contiuually, supplies kept up, and tools kept in order. This shop is in charge of Frank A. Davis.

In The Screen Department

Some fifty different varieties of screens for quartz mills are made. They are made of Russian iron, galvanized iron or zinc. Holes are punched in these plates from half an inch diameter down to that of a number ten cambric needle. The machinery for this department is very perfect and was designed and constructed at the works. It was made to suit the special requirements of this class of work. Mr. Buxton is in charge of this department.

The Laboring Department.

In so immense an establishment a large number of laborers, as distinct from skilled mechanics, are necessarily required, and they form a department of their own, furnishing all labor necessary to sustain the skilled departments of the business. There are sixty-three men in this department, under charge of Mr. Wetherby.

In the Shipping Department

A very complete system of shipping and tallying is carried out. All articles are weighed separately in each order and numbered, with value, etc. This being the case, in the event of any particular piece or package being injured or lost during transportation, its weight and value is seen by referring to the memorandum, and there is no confusion in determining what to replace or what is lost. The utmost care is taken in shipping goods, to the great benefit of purchasers as well as the works. In charge of Robert Peckham.

The Police System.

In a large establishment like this, employing 476 men, some system is of course needed to keep a check on the men and look out for those who shirk duty or endeavor to get full "time" with very little work. In these works the idlers, loafers, etc., are closely looked after and weeded out as soon as possible. Each man has a metal check with his number on it, which on his arrival in the morning he hangs on a peg having a corresponding number. This is under the supervision of one of the "police department." It is, of course, easy to see who is there and who not. At regular intervals during the day men go around the works and see that all the hands are fully employed, and of course each foreman sees that his men do not "soldier." When the men come in at one o'clock they each take their numbers from the pegs, so it is again known whether all the force returns at the proper time.

The Apprenticeship System.

The firm receives boys at the age of seventeen, for four years, paying them the first year $4 per week; the second year, $6 per week; the third year, $8 per week; and the fourth, $10 per week. At the expiration of the time a pretty correct estimate of their worth can be formed, and if they have proved themselves good workmen they are kept employed in the establishment, and experience has shown that they generally accomplish more work than Eastern men. The firm undertakes to give the boys a trade and they bind themselves to remain four years. If they leave the establishment without permission during that time, they forfeit all pay due them when they leave, and the proprietors reserve to themselves the right to discharge any boy for incompetency or want of punctuality. The boys usually prove themselves attentive and industrious, for no shop will employ an apprentice from another shop unless he brings a written discharge. This established rule prevents boys from roaming about from one shop to another. The reward for ability and good behavior is promotion in work and tools. Under this system of mutual good will, the employers are protected and the employees saved from the unpleasantness of being bound to unappreciated servitude. The good boy is promoted; the bad boy discharged. The former, in fact, does not require to be bound, and the latter is not wanted on any terms whatever. The advantage to the boy is he learns a respectable trade and obtains the means of earning a good living, while the advantage to the community is that every boy who labors faithfully in the establishment has inducements to become a respected citizen; for while it is the aim of the proprietors to make a first class mechanic, they also seek to train an intelligent and peaceful member of the community. At present there are seventy-two apprentices at work in the Union Foundry—three draftsmen, six pattern makers, thirteen moulders, ten boiler makers, three blacksmiths and thirty-seven machinists. These boys are nearly all children of poor parents and in a number of instances the main support of widows. The system of apprenticeship in force in the establishment was secured with great difficulty in the teeth of the combined opposition of the trades unions.

Mr. Scott has done more in a practical way to solve the question "What shall we do with our boys," than has been done by all the speeches and newspaper articles on the subject combined. It is to be hoped that others will follow in his footsteps. Mr. Scott's experience convinces him that by a judicious system of management of the boys of California, they can most sucessfully compete with any cheap labor, to the advantage of themselves and their employers as well.

As an indication of the gradual growth of the business of this foundry, which tends also to show the advance California has been making, we append a list of the engines and boilers made by the Union Iron Works from 1856 to 1874 inclusive:

Year.	Engines.	Boilers.	Year.	Engines.	Boilers.
1856.....	3	3	1866.....	18	45
1867.....	3	7	1867.....	19	39
1858.....	9	13	1868.....	21	28
1859.....	5	7	1869.....	16	41
1860.....	5	11	1870.....	15	21
1861.....	11	20	1871.....	27	51
1862.....	4	2	1872.....	30	49
1863.....	16	38	1873.....	24	45
1864.....	21	66	1874.....	38	77
1866.....	20	61			

This makes a total of 306 engines and 776 boilers made at these works from 1856 to January, 1875. Of course these engines and boilers varied greatly in size. The three engines turned out in 1856 only aggregated 75 horse power, while one engine built for the Consolidated Virginia mills last year, was 679 horse power alone. Of late years the engines and boilers made have been much larger than formerly, and the mining machinery much heavier. They have three large engines on hand now of a combined capacity of 1,680 horse power. The largest one, 680 horse power is for the California mill; another one of 500 horse power is for the pumping engine of the same mine; the other is for the pumping works of the Lady Washington mine.

Mining Machinery

Has always been a specialty at these works as at most California foundries, and the Union has gained an enviable reputation for its work in this line. We append a table which will show the number of stamps, pans and settlers made since 1865, at these works:

Year.	Stamps.	Pans.	Settlers.
1865.....	227	87	34
1866.....	308	37	17
1867.....	212	48	27
1868.....	113	43	19
1869.....	113	55	25
1870.....	120	67	39
1871.....	230	95	32
1872.....	133	39	28
1873.....	125	37	18
1874.....	277	66	31
Totals.....	1858	586	271

These figures show that these works have turned out a large number of quartz mills with all their appurtenances, and when it is considered that this is only one of the foundries of the city, it will be seen that the amount of such work done is more than most people suppose. They have striven to attain perfection in this line, and their efforts have been rewarded with success. Drawings are made here of this class of work, which are sent to England and all over the world. The model mill for the Massachusetts Institute of Technology was also made at these works. The Savage hoisting works, the largest on the Comstock lode, were made at this foundry. This was the first instance where they introduced the conical winding drum for round wire rope. It was the first cut gear of any magnitude used in hoisting, and the first poppet valve engine used in hoisting. They are now engaged in building the largest quartz mill ever built, for the California mine, on the Comstock. It will have seventy stamps, forty-six pans, with all the most complete appliances known in modern quartz machinery.

This institution was the first to introduce poppet valve engines on this coast, and also introduced the system of direct acting hoisting and pumping engines for mines. In all these improvements they have always endeavored to keep economy of steam in prominent view. It would be difficult to enumerate all the new departures from old ideas initiated by these works.

Locomotives.

The *California*, which was the first regular locomotive ever constructed on this coast, was made at these works, and was pronounced by competent judges to be satisfactory in every respect. This was some years ago, and since then they have turned out seventeen locomotives altogether.

This firm makes a specialty of horizontal and vertical engines of all sizes and patterns. It also makes a specialty of cut spur wheels of

every variety, having every facility of furnishing spur and bevel wheels of all sizes at short notice and low price. As an instance of the size of this class of work turned out here may be mentioned the fact that they recently cut a spur wheel for the Savage mining company, weighing 66,400 pounds, being 21 feet in diameter, 19 inches in face and 6 inches in pitch. This is believed to be the largest cut gear that has ever been made in any part of the world, and it is deserving of special mention that the cut was as accurate as the wheel of any watch. They have also lately cut bevel wheels ten feet in diameter.

The Union iron works employ a small army of men in the different departments. Altogether there are 476 men employed in the establishment, as follows: Pattern makers, 18; machinists, 143; blacksmiths, 40; boiler makers, 72; laborers, 63; moulders, 127; draftsmen, 4; draymen, 7; and watchmen, 2.

Two engines of a total capacity of 120-horse power drive the machinery of the works. The consumption of pig iron per year is about 4,500 tons. They use 1,000 tons of Lehigh coal for smelting and other purposes. 1,200 tons of fuel coal and 400 tons of Cumberland coal for

"The Glorious Fourth."

It is not a jot nor tittle the less "glorious" on account of the extravagant praises of its friends, or the sneers and criticisms of its enemies. The burlesques on "the spread eagle" have not clipped the wings of the emblematic bird, and the people will continue to keep this truly glorious day according to dictates of their own consciences, their own tastes and their pockets; and the first century of American independence will, on Monday next, receive a grand parting salute. This century has been an experimental one, and has proved as satisfactory to the world at large as an experiment, as it has to our own people. It is a grand century's work; and realizing this, as we must while looking at it as a whole, we should be very careful how we disparage one decade in order to exalt another. There have been "revolutionary heroes" in many epochs in our history; and there also have been conservative heroes who have rendered effective service to the country in the seemingly unimportant periods between these epochs. The coming century will uncover ten acres of ground, giving plenty of place for the exhibition of all the articles expected. There will be provided also, ample and suitable accommodations for the shelter and display of live stock, which it is intended shall be exhibited during the months of September and October. The exhibition being international, will bring together for comparison the best products from every quarter of the globe; hence every effort should be made to give just evidence of the capacity of the varied climates, soils, skill in tillage, and the character of the live stock in the United States; whilst the mechanical aids to agriculture should exhibit ingenuity, excellence of workmanship, and adaptation to the desired ends.

Notices of Recent Patents.

Among the patents recently obtained through Dewey & Co.'s Scientific Press American and Foreign Patent Agency, the following are worthy of mention:

Improved Bed Bottom.—Demmen & Newhouse, Stockton, Cal. This invention relates

Manufacture of Overalls, Blouses, Etc.—S. R. Krouse, San Francisco, Cal. This is an improvement in the manufacture of clothing such as overalls, blouses, jumpers, and that class of goods which are worn during manual labor and are subjected to heavy strains at different points. The invention consists in a novel construction and the use of strengthening pieces at various points, so as to overcome the tendency to rip. Across the tops of the pockets in a pair of overalls is formed a stay, which is turned down and stitched to the upper part of the pocket and resembles an ornamental flap or pocket cover without the use of the separate piece. The ends of this stay are covered out a short distance beyond the edge of the pocket, running to a point and are firmly attached. In order to make a button stay and at the same time secure the brace and pocket opening, a piece is made which is stitched with its upper end to the upper end of the band. The button is sewed through this piece and also the band, thus preventing it from being torn out. A strip extends across the lower edge of the band, which is there firmly secured. From this point

THE AGRICULTURAL BUILDING AT THE CENTENNIAL.

smith purposes. They also use 5,000 tons of wrought iron; 300 tons of boiler plate, and about 8,000 tubes for a year's supply. The amount of money distributed by this institution for wages alone will average $250,000 per year. This establishment has been carried on to its present position in a country that does not produce a pound of pig iron, no hard wood timber, not a pound of coal except for fuel purposes, and where wages are at least thirty-three per cent. higher than in the Eastern States.

In the California mine, on the Comstock, the prospecting work on the 1500-ft level is fast narrowing down to small proportions, the steady, systematic and vigorous prosecution of the work having, with the exception of a small portion of the extreme north end of the ledge, literally cut the whole into immense blocks and squares, the tunnels and cross drifts having much the resemblance of the thoroughfares of some great city.

The Belcher mine is looking well throughout, and there is no apparent probability of a reduction in the quality and quantity of the ore extracted for months to come. The air shaft is nearly completed to the 1200-ft level, thoroughly ventilating the lower levels of the mine and greatly facilitating the work in that portion of the mine. The surface repairs to the machinery is also about completed, so that everything is in the best possible working condition.

doubtedly need the services of both these classes of heroes; and notwithstanding our characteristic disparagement of "the period," we firmly believe that when the coming century shall have finished its course, and in rendering its account has occasion to allude to its "illustrious predecessor," there will be little distinguishing of periods in awarding its praises.

As a reminder of the grand International Exhibition in honor of the hundredth anniversary of the "glorious Fourth," and with a view to stimulate active interest in its success, we have given this most conspicuous part of our paper this week to an illustration of one of the Centennial Buildings.

Of course in the exhibition of 1876, where all the inventions of the nation are to be represented, agriculture will have a prominent place. The Centennial Commissioner, realizing the importance of the agricultural interests of the United States, and anticipating the demands that will be made for proper representation, is making ample provision for the accommodation of this department. The Bureau of Agriculture has been organized as one of the bureaus of administration of the exhibition, and will comprehend the native and cultivated products of the soil, and of objects immediately derived therefrom. The exhibition will open May 10th, 1876, and those who desire to exhibit cereals, forage plants and tubers, should make their preparations during the present season. The building, shown in the accompanying engraving, is most eligibly located in Fairmount park, and will

to an improvement in the construction of the upper and lower coils of spiral bed springs and to an improved arrangement for connecting the upper coils of the springs together when they are secured in position in the bed bottom frame. It further consists in the employment of C-springs for supporting the upper frame of the bed bottom. The springs employed are constructed similar to any ordinary spiral spring, with the exception of their upper and lower coils. These coils are formed by bending the wire short upon itself and coiling it backwards in a direction opposite to that in which the intermediate coils are wound, and then hooking the extremity of the wire in the short bend, so that a perfectly flat and complete ring is formed in each end of the spiral spring, giving an even bearing surface. When the springs are secured in their relative positions, a flat conical spring is secured in the space between the upper coils of each four springs by means of wire hooks or connections, which connect the top coil of each of the four springs with the lower or base coil of the flat conical springs, thus providing a spring bearing on what would otherwise be an open space. The upper coils are also connected by a wire rod, to prevent them spreading apart. A leather or other equivalent strap has one end fastened to each of the frames opposite the C-springs. By shortening the connecting strap the tension of all of the springs as well as that of the C-springs, can be increased, and the bed thus regulated for a light or heavy weight.

it is tapered and crosses the corner of the pocket opening, being firmly stitched and forming a stay. The back strap is so formed that it passes along with its upper part beneath the lower edge of the band and is there stitched in. From this point the strap extends downward and across the side or hip seam and the lower corner of the pocket, thus serving as a pocket stay and a powerful strengthener to the hip seam, which is thus prevented from ripping. By this method of reinforcing the various parts, the invention is able to resist the greatest strains and the wearers can use suspenders or not as desired.

L. W. Coe has just opened an establishment at the corner of Sansome and Sacramento streets in this city, where he furnishes complete mining outfits for power drills. He is the inventor of, and has on hand, the new "California Drill," referred to by us a few weeks since.

The New California Mill.—The erection of the new mill is being pushed to completion with all the energy possible, all the men that there is any show whatever to work being employed in its erection.

At the New York Consolidated mine, on the Comstock, the mason work for the deep and heavy foundations of the new machinery is well commenced and being pushed forward energetically.

Varney's Patent Amalgamator.

These Machines Stand Unrivaled.

For rapidity pulverizing and amalgamsting oras, they have no eqnal. No effort has been, or will be spared to have them constructed in the most perfect manner and of the great nnmber now in operation, not one has ever required repairs. The constant and increasing demend for them is sufficient evidence of their merits.

They are constructed so as to apply steam directly into the pulp, or with steam bottoms, as desired.

This Amalgamator Operates as Follows:

The pan being filled, tha motion of the muller forces the pulp to the center, whera it is drawn down throngh the apperture and between the grinding surfaces.—Thence it is thrown to the periphery into the quicksilver. The curved plates again draw it to the center, where it passes down, and to the circumferecace as before. Thus it is constantly passing a regular flow between the grinding surfaces and into the quicksilver, until the ore is reduced to an impalpable powder, and the metal amalgameted.

Setlers made on the same principle excel all others They bring the pulp so constantly and perfectly in contact with quicksilver, that tha particles are rapidly and completely absorbed.

Mill-men are invited to examine these pans and setlers for themselves, at the office, 229 Fremont Street, San Francisco

Tenth Industrial Exhibition of the Mechanics' Institute, S. F., 1875.

PRELIMINARY ANNOUNCEMENT.

The Board of Managers of the Tenth Industrial Exhibition have the pleasure of announcing that an Industrial Exhibition will be held, under the auspices of the Mechanics' Institute, in the city of San Francisco, to be opened on Tuesday, the 17th of August, 1875, at 11 A. M., and to continue open at least one month thereafter.

In making this public announcement, the Managers desire that those who intend to exhibit should send in their applications for space as early as possible, so as to avoid the necessity of excluding, as has been the case heretofore, the many desirable exhibitors who are unusually tardy in making applications.

The forthcoming Industrial Exhibition will be the tenth held under the auspices of the Mechanics' Institute, and the Managers are justified in saying that it will undoubtedly surpass in completeness of detail and general arrangement any heretofore held.

The last Exhibition was attended by 700,000 visitors, attracted hither by the fame of these Industrial Fairs, and for the purpose of investigation, business and pleasure.

All the available exhibiting space was applied for several weeks before the day of opening, and the Managers were compelled to deny admission to many desirable exhibits.

The Board of Managers desire particularly that the arts, the industries and natural products of the country should be well represented at the forthcoming exhibition, and no pains will be spared to make these classes of exhibits a special feature there.

The Exhibition will be held in the building constructed for that purpose in 1874, but it will be materially enlarged and improved in many details for the Exhibition of 1875.

The space under roof will exceed 180,000 square feet, or about four and a half acres, exclusive of the Horticultural Garden, which will occupy 24,500 square feet additional.

The location of the Exhibition Building, on Eighth street, between Market and Mission streets, cannot be surpassed for convenience and accessibility, and can be approached from every part of the city by means of the various lines of street railroads, any of which bring visitors within two blocks of the entrance gate.

The utmost care has been exercised in providing for ample ventilation and light, and during the evening the building is brilliantly illuminated by over 5,000 gas lights.

The promenade avenues are broad, and 3,000 seats are provided for the comfort of visitors, for whose convenience there is also an excellent restaurant, under the management of a first-class restaurateur.

Every afternoon and evening the best orchestra the city can supply will discourse excellent music under the direction of an accomplished leader.

The building is always well attended by visitors, and during the last Exhibition over 29,000 were daily admitted for a number of days, and under no similar circumstances can the manufacturer, the mechanic, the inventor, producer or business men so advantageously place himself before the people of the Pacific Coast.

Persons desiring to obtain information, or to make application for space, should address "Managers of Tenth Industrial Exhibition, San Francisco, California," or make personal application as below.

It is expected that the various transportation companies will convey goods intended in good faith for exhibition, at half the usual rates.

Exhibitors from abroad, if they have no agent or consignee in San Francisco, can consign goods and mark the same to the "Manager of the Tenth Industrial Exhibition, 17 Post street, San Francisco," and they will be stored, if they arrive before the day of opening, free of expense; but no charges or expenses for freight or forwarding, etc., will be paid by the Managers.

In order to secure space, application should be made on or before July 20th, 1875.

Blanks will be furnished on application.

Premiums will be awarded as follows, viz: 16 gold medals, 50 silver medals, Society Diplomas, Certificates of Merit and Special Premiums, as the Board may determine.

Blanks for space can be obtained at the Mechanics' Institute on application by letter or otherwise; and any information will be given, by applying to any member of the Board of Managers, as below:

A. S. HALLIDIE.....113 Pine street.
JAMES O. PATRICK.....122 Battery street.
HENRY L. DAVIS.....421 California street.
D. E. HAYES.....213 Fremont street.
ASA B. WELLS.....Mechanics' Mill.
P. B. CORNWALL.....Cor. Speer & Harrison streets.
CHAS. ELLIOT.....516 California street.
GEORGE SPAULDING.....414 Clay street.
RICHARD SAVAGE.....139 Fremont street.
W. P. STOUT.....604 Merchant street.
J. H. MACDONALD.....217 Spear street.

R. B. WOODWARD.....Woodward's Gardens.
JAMES SPIERS.....311 Howard street.

To the Librarian of the Mechanics' Institute, or to J. H. CULVER, Secretary, 27 Post street, S. F.

Rules and Regulations of the Tenth Industrial Exhibition, Mechanics' Institute, S. F., 1875.

1. The Pavilion will be open for the reception of goods on Monday, August 2d. The exhibition will be open to the public on Tuesday, August 17th, at 11 o'clock A. M.

2. Applications for space must be made on or before July 20th, stating character of exhibit, amount and kind of space required—wall, table or floor. And, if cases, state length, width and hight of case. Blanks will be furnished for this purpose, and a clerk will be in attendance at the Library of the Mechanics' Institute, every day from 12 to 1, and 7 to 10 P. M.

3. All persons presenting articles for exhibition must have them registered by the Receiving Clerk, who will give a receipt for the same, which receipt must be presented when the articles are withdrawn, at the close of the Exhibition.

4. Judges will be appointed by the Board of Managers, immediately upon the opening of the Exhibition, to examine all articles presented, in accordance with Article III, and the Managers will award premiums on such articles as the judges shall declare are worthy, which will be delivered as soon as they can be prepared. Due notice will be given of the announcement of premiums.

5. The mornings of each day, until 10 o'clock, will be appropriated to the Judges, and no visitors will be admitted during the time thus appropriated, except at the special request of the Judges, or by permission of the Managers.

6. Articles intended for sale may be labeled accordingly, but cannot be removed until the close of the Exhibition, except by written permission of the Managers.

7. Steam power will be provided, so that machinery of all kinds may be seen in actual operation, and every facility possible will be given to exhibit working machinery to the best advantage.

8. The name of every article must be attached by the exhibitor to it.

9. Articles intended for exhibition must be entered and placed on exhibition on or before Saturday, August 21st,

10. Perishable articles will be received, or may be removed at any time during the exhibition, with the consent of the Managers.

11. The most effectual means will be taken, through the agency of the Police and otherwise, to guard and protect the property on exhibition; and it will be the purpose of the managers that all articles shall be returned to the owners without loss or injury. Still, all articles deposited will be at the RISK OF THE OWNERS.

12. In case of any misunderstanding, application may be made to the Managers, who will at all times be in attendance.

13. The Managers are desirous that articles should be presented early. Those from abroad, intended for exhibition, should be properly packed, and if not consigned to exhibitor's agent, must be marked, "MANAGERS OF TENTH INDUSTRIAL EXHIBITION, SAN FRANCISCO, CAL." All articles thus received, arriving too early, will be stored free of cost to the exhibitor, and the Managers will have them duly placed in proper position for exhibition. No freight charges will be paid by the Managers; but exhibitors are notified that arrangements are being made with various transportation companies to repay freight charges on evidence of goods exhibited.

Information will be furnished by addressing MANAGERS OF TENTH INDUSTRIAL EXHIBITION, SAN FRANCISCO, CAL.

WIRE ROPE

For Mining, Shipping, and General Purposes.

All kinds and sizes on hand, or made to order; guaranteed of unsurpassed quality, and manufactured of any length. FLAT ROPES, ROUND ROPES and TAPER ROPES, of IRON OR STEEL.

Patent Endless Wire Ropeway

(WIRE TRAMWAY,)

FOR THE RAPID AND ECONOMICAL TRANSPORTATION OF ORES AND OTHER MATERIAL OVER MOUNTAINOUS AND DIFFICULT ROADS.

This system has been in use for over three years, and given thorough satisfaction.

THE NEVADA

QUARTZ MINING PROPERTY FOR SALE,

With a new 15-stamp mill, now running. Has its own water power, with houses, shops, etc. Government title; joins the Providence mine, on Deer Creek, Nevada City, Cal. For sale or to bond.

Address, I. S. VAN WINKLE,
413 Market street, San Francisco.

San Francisco Cordage Company.

Established 1856.

We have just added a large amount of new machinery of the latest and most improved kind, and are again prepared to fill orders for Rope of any special lengths and sizes. Constantly on hand a large stock of Manila Rope, all sizes; Tarred Manila Rope; Hay Rope; Whale Line, etc., etc.

TUBBS & CO.,
e20 611 and 613 Front street, San Francisco

QUICKSILVER.

UNITED STATES PATENT OFFICE.

The Quicksilver Mining Company of New Almaden, California—Trade-mark for Quicksilver Flasks.

Statement of trade-mark No. 1499, registered October 19, 1873; application filed September 29, 1873.

Specification describing a trade-mark, used by the Quicksilver Mining Company, a company chartered by the State of New York, and working and operating quicksilver mines at New Almaden, Santa Clara county, State of California, for Quicksilver Flasks.

Our trade-mark consists of the letter "A" straddling a circle. This letter has generally been painted upon the upper end of each flask, bottle, or jar in which the quicksilver is contained, its usual position being such that the opening or mouth in the upper end of the flask, bottle or jar will be between the spreading angular sides of the letter, the cross-mark of the letter passing along close to the edge of the hole.

This trade-mark we have used in our business for ten years last past. The particular goods upon which we have used it are quicksilver flasks, and it has always been applied as above described.

THE QUICKSILVER MINING COMPANY.
By J. B. RANDOL, Manager.

This trade-mark is also registered in the office of the Secretary of State, Sacramento, California, and all producers and dealers in quicksilver are cautioned not to use the said trade-mark.

For New Almaden Quicksilver, apply to
THOMAS BELL, Sole Agent,
Over Bank of California, San Francisco.

NEW ALMADEN QUICKSILVER.

TRADE **A** MARK.

The well known full weight and superior quality of the quicksilver produced at the New Almaden Mines having induced certain unscrupulous persons to offer their inferior productions in flasks having our trade-mark, "A." notice is given to consumers and shippers that quicksilver, "A" brand, guaranteed weight, can be purchased only from THOMAS BELL, San Francisco, or his duly appointed sub-agents.

J. B. RANDOL, Manager.

New Almaden, April 5, 1875.

Ayer's Sarsaparilla,

FOR PURIFYING THE BLOOD.

This compound of the vegetable alteratives, Sarsaparilla, Dock, Stillingia and Mandreke with the Iodides of Potassium and Iron makes a most effectual cure of a series of complaints which are very prevalent and afflicting. It purifies the blood, purges out the lurking humors in the system, that undermine health and settle into troublesome disorders. Eruptions of the skin are the appearance on the surface of humors that should be expelled from the blood. Internal derangements are the determination of these same humors to some internal organ, or organs, whose action they derange, and whose substance they disease and destroy. AYER'S SARSAPARILLA expels these humors from the blood. When they are gone, the disorders they produce disappear, such as Ulcerations of the Liver, Stomach, Kidneys, Lungs, Eruptions and Eruptive Diseases of the Skin, St. Anthony's Fire, Rose or Erysipeles, Pimples, Pustules, Blotches, Boils, Tumors, Tetter and Salt Rheum, Scald Head, Ringworm, Ulcers and Sores, Rheumatism, Neuralgia, Pain in the Bones, Side and Head, Female Weakness, Sterility, Leucorrhœa arising from Internal ulceration and uterine disease, Dropsy, Dyspepsia, Emaciation and General Debility. With their departure health returns.

Rifle Shooting.

Rifle shooting has become much more popularized in this country within the past year or two than heretofore. This is owing principally, no doubt, to the introduction of long range shooting and the skill necessary to make a good score. American rifles have always been noted ever since the time of the old Kentucky rifle. The leading feature of that weapon was the small bore and heavy weight of metal around it. The leading points in the construction of rifles now is to get them as near as possible to the requirements of military duty. They want as much metal as is proper for a soldier to carry and no more. The maximum weight of most rifles is now about ten pounds.

Within the past ten or fifteen years attention has been turned to shooting at greater distances, and considerable changes have been made on rifles. The form of rifling has been changed from a slow twist and deep grooves to rapid twist and shallow grooves. The form of bullets has been changed from a light picket ball to one of a long cylindrical conoid form, made of hardened lead instead of soft lead, so as not to "strip" on the shallow rifling. The bullets are heavier than they used to be and the charges of powder heavier.

Some twelve or fifteen years ago the English turned their attention more particularly to the rifle and adopted the Hythe system of shooting. The principle feature of this system is the use of targets, either round or square, by which a rapid scoring can be attained; and also the adoption of rules in regard to position, which are intended to fit the men for shooting under all circumstances. The interest aroused recently has been created by competition and the close calculations necessary to hit a target at a long distance. The wind, state of the atmosphere and many other things have to be taken into consideration. Often in shooting at 1,000 yards, the muzzle of the gun will point actually twenty-five feet to one side of the spot where the bullet is intended to hit.

The recent rifle matches have created considerable interest, and it is a subject of congratulation that the American team has beaten the Irish team on its own ground. Both teams made splendid scores, but the Americans had thirty-eight majority of the three ranges, as will be seen by the following score:

AMERICAN TEAM.

	800 yds.	900 yds.	1000 yds.	Total.
Fulton	58	57	46	161
Daken	58	55	51	164
Yale	56	52	51	160
Gildersleeve	56	56	52	164
Coleman	56	48	52	156
Bodine	52	58	51	162
	337	327	303	967

IRISH TEAM.

	800 yds.	900 yds.	1000 yds.	Total.
Pollock	58	53	49	164
Wilson	56	54	56	151
Johnson	58	29	50	140
Hamilton	56	64	51	161
Milner	55	68	41	154
McKenna	52	44	53	149
	338	292	299	929

This international contest took place at Dublin, Ireland.

Another interesting match took place last Saturday, between the Sumner Light Guard of California, and twelve men of Company D, 12th Regiment, N. G. S., New York. The New Yorkers used the Remington and the Sumners the Sharp rifle. The individual scores of each team were as follows:

NEW YORK.	200 yds.	500 yds.	Total	CALIFORNIA.	200 yds.	500 yds.	Total
H. B. Smith	22	24	46	Burke	23	26	49
T. J. Dolan	19	25	44	Robertson	22	24	46
E. H. Madison	21	24	45	Strong	24	22	46
A. Wood	21	22	43	Nash	23	22	45
J. A. Banta	22	21	43	Watson	22	22	44
John Beattie	21	21	42	Murphy	18	26	44
W. G. Carson	16	25	41	Steed	22	21	43
W. C. Reddy	20	21	41	Earle	22	20	42
W. S. Smith	21	19	40	Burns	19	22	41
L. Moran	17	20	37	Preble	16	21	40
J. M. Burlew	16	21	36	Dove	20	19	39
J. H. Wood	20	9	29	Hunt	21	11	32
Totals	235	253	488	Totals	255	256	511

This makes a score of 488 to 511, leaving a majority of twenty three in favor of the California boys, and making the Sumner Light Guard the champion rifle company of the States of New York and California. The result of this match was communicated to the respective teams by telegraph, each team doing their shooting in their own States. It will be seen that Mr. Burke made the best score, but Mr. George Strong, (of the MINING AND SCIENTIFIC PRESS), at the 200-yard target, made the highest score thus far recorded in any match at this range in the United States. At 200 yards the highest recorded score at Creedmoor is twenty-three points, seven shots, military rifles, and as Mr. Strong's was twenty-four, it beats the former best record.

As considerable interest has been aroused in the sport, we shall probably have several other matches soon.

The Consolidated Virginia mine is yielding daily 600 tons of ore, keeping the mills all running up to their full crushing capacity. The yield of bullion for the present month will amount to about $1,500,000, differing but little, if any, from that of the last two months. The ore breasts are all yielding well, and in fact the entire mine is looking as well or better than it has for the past twelve months.

Industrial Items.

THE contract for furnishing the gas fixtures for the Palace Hotel has been awarded to Thos. Day & Co., of this city. The dining-rooms will be lighted by twenty-four light chandeliers. Each of the 755 sleeping rooms will be furnished with a five-light chandelier with center light extension arm. The office will have four twenty-four light chandeliers, one each in the ladies' and gents' reception rooms, reading room and bar room, and two in the ball room. On each of the marble mantles will be two standard lights, making 1,408 in the hotel. The bath and wash rooms will require 1,800 brackets. Around the balconies in the inner court will be 108 standard lights, with three and five-light clusters. At the entrance to the court will be rich brass bracket lamps, with coach lantern beveled edge glass.

JOHN W. BASSNINE, representing the Gold mining company on the Upper Amoor river, Eastern Siberia, has contracted with Stephen H. Davis, of the Pioneer shipyard, and John Csiue, of the Globe iron works, Stockton, for the construction of a steru wheel steamer of the following dimensions: The hull to have a length of 135 feet; breadth of beam, 28 feet; depth of hold, 5 feet. The machinery will consist of double engines with oyliuders of 14-inch bore and 4-feet stroke; two boilers, 42 inches in diameter and 16 feet in length. The hull is to be put up in sections here, then taken apart and shipped to San Francisco, from whence it will be reshipped on board a sailing vessel for a port on the Amoor. Hull and machinery are to be ready for shipment from San Francisco not later than April 1st, 1876.

THE new telegraph line from Santa Cruz to San Francisco will soon be in complete connection with Southern California. Work is going on at present connecting the line with San Juan and Gilroy, and when that is finished the circuit will be complete.

AT a meeting of the Board of Direotors of the Sonoma and Marin railroad company, held in Petaluma last week, contracts were let for grading thirteen miles from that point and constructing the tunnel near San Rafael.

A COMMITTEE have been appointed to make inquiries among the land owners, and to raise funds for the right of way in that the Santa Cruz narrow gauge railroad may be extended to Watsonville.

A No. 6 blower, the largest size manufactured, has just been completed for the new Coso mining company, Darwin City, Inyo county, by the Globe iron works, Stockton.

THE New England tunneling and smelting company's saw mill will be ready for operation by the last of July. The mill will be sixty-two by twenty-four feet.

THE corner stone for a new wine manufactory was laid by Mr. N. Carriger, on his ranch, in the Sonoma valley.

WM. H. HARRISON, of Livermore, has applied for a patent for a one rail railroad of his own invention.

A NEW schooner called the *Mary E Russ* was launched at Eureka, Humboldt county, on the 22d ult.

General News Items.

MRS. DANA RICE, of Santa Cruz, was recently relieved of a brass pin by coughing it up from her lungs. It had been thought for a long while that Mrs. Rice was afflicted with consumption, but this incident proved the opinion to be erroneous.

THE Washington National Monument Society request the churches and Sabbath schools of the country to take up a collection on Sunday, July 4th, to aid in completion of the monument; contributions to be forwarded to J. B. Smith, Treasurer of the society, Washington, D. C.

THE Commissioner of the General Land office has granted a patent to the rancho Santa Rita, confirmed to Joel Ramon Mals, containing over 12,000 acres in Santa Barbara county, Cal. The patent was sent out on June 28th, to the Surveyor General of California.

AN inundation, most disastrous in its results, occurred in France last week. The number of persons drowned in Toulouse alone is estimated at 2,000. Damage to property in that city and Agen, $24,000,000.

THE officials at the Treasury Department in Washington are busy taking account of stock, necessitated by the transfer of the funds from the custody of General Spinner to Mr. New, the newly appointed Treasurer.

THE pupils of the Sacramento schools may not look with unalloyed pleasure at the coming Centennial. The Board of Education propose to shorten the vacation this year in anticipation of that event.

THE International rifle match took place near Dublin, on Tuesday last. After a display of admirable shooting by both American and Irish teams, the former proved victorious by a score of 968 to 928.

Two graveyards are offered for sale by the Oregon and California railroad company. An interesting locality for anybody wishing a home surrounded by "silent memories of the past."

THE *Oceanic*, the pioneer steamer of the Oriental and Occidental line, arrived at this port last Thursday from Hongkong and Yokohama.

ONE hundred and fifty thousand dollars, worth of property was destroyed by the recent storm in Iowa.

THE Portland *Journal* is arguing the construction of a canal from the Oregon City Falls to Portland, a distance of thirteen miles, to be used for water power for driving machinery.

Two Italians were arrested in Marysville last Saturday, charged with counterfeiting. A large amount of metal and a supply of $2.50 gold pieces were found at their haunt.

THE steam dredge is hard at work in Wilmington harbor, and the people there still feel confident that their city will be the sea port of Southern California.

NOTWITHSTANDING the fact that half a ton of ice a day is used in Visalia, the thermometer marked 103 deg. in the shade there last Monday.

SENATOR JONES' Turkish bath house was opened on Tuesday last.

PATENTS & INVENTIONS.

A Weekly List of U. S. Patents Issued to Pacific Coast Inventors.

[FROM OFFICIAL REPORTS FOR THE MINING AND SCIENTIFIC PRESS, DEWEY & CO., PUBLISHERS AND U. S. AND FOREIGN PATENT AGENTS.]

By Spacial Diapatch, Datad Washington, D. C., June 29th, 1875.

FOR WEEK ENNING JUNE 15TH, 1875.*

PAINT COMPOUNN.—Isaac L. Merrell, S.F., Cal.

PLOW.—Christian Myers, Marysville, Cal.

CARRUETER.—John C. Henderson, S. F., Cal.

HORSE POWER.—Horace Parkhurst, Oakland, Cal.

TRADEMARKS.

FOR SALTED, PICKLED AND PRESERVED SALMON. J. W. and V. Cook, Clifton, Oregon.

FOR ANTI-FRICTION METAL.—Geo. S. Hunt, Sacramento, Cal., and Benjamin Hunt, St. Louis, Mo.

*The patents are not ready for delivery by the Patent Office until some 14 days after the date of issue.

NOTE.—Copies of U. S. and Foreign Patents furnished by DEWEY & CO., in the shortest time possible (by telegraph or otherwise) at the lowest rates. All patent business for Pacific coast inventors transacted with perfect secrecy and in the shortest possible time.

Monthly List of Scientific Books.

Progress at the Sutro Tunnel.

The following is the report of progress in the Sutro tunnel, for week ending June 22, 1875:

Number of feet in tunnel, June 16	9,735
Number of feet driven during week	80
Distance in, June 22	9,816

Details of work performed are as follows, heading being 8x10 feet:

Holes drilled	403
Holes blasted	405
Average depth	6 14-100 feet
Powder consumed	883 lbs
Exploders consumed	405

ROCK.—Comstock porphyry, containing iron pyrites. Favorable blasting.

WATER.—One hundred miners' inches flowing.

[Signed] A. SUTRO, Gen. Supt.

SYMPTOMS OF LIVER COMPLAINT, AND OF SOME OF THE DISEASES PRODUCED BY IT.

A sallow or yellow color of skin, or yellowish brown spots on face and other parts of body; dullness and drowsiness, with frequent headache; dizziness, bitter or bad taste in mouth, dryness of throat and internal heat; palpitation; in many cases a dry, teasing cough, with sore throat; unsteady appetite, raising food, choking sensation in throat; distress, heaviness, bloated or full feeling about stomach and sides, pain in sides, back or breast, and about shoulders; colic, pain and soreness through bowels, with heat; constipation alternating, with frequent attacks of diarrhœa; piles, flatulence, nervousness, coldness of extremities; rush of blood to head, with symptoms of apoplexy, numbness of limbs, especially at night; cold chills, alternating with hot flashes, kidney and urinary difficulties; dullness, low spirits, unsociability and gloomy forebodings. Only few of above symptoms likely to be present at one time. All who use Dr. Pierce's Alt. Ext. or Golden Medical Discovery and Pleasant Purgative Pellets for Liver Complaint and its complications, are loud in their praise of them. They are sold by all dealers in medicines.—*Com.*

UNITED STATES
Mineral Land Laws, Revised Statutes,
And Inatructiona and Forma Under tha Sama.

We have just issued a pamphlet containing the general mineral land laws of the United States, with instructions of the Commissioner of the Land Office The contents of this pamphlet comprise all of the Government laws with relation to mineral lands of interest to the mining community, as follows: Mining Statute of May 10th, 1872, with Instructions by the Commissioner of the Land Office; Mining Statute of July 26th, 1866; Mining Statute of July 9th, 1870 Forms required under Mining Act of May 10th, 1872, as follows: Notice of Location; Request for Survey; Application for Patent; Proof of Posting Notice and Diagram of the Claim; Proof that Plat and Notice remained Posted on Claim during Time of Publication; Registers' Certificate of Posting Notice for Sixty Days; Agreement of Publisher; Proof of Publication; Affidavit of $500 Improvements; Statement and Charge of Fees; Proof of Ownership and Possession in Case of Loss or absence of Mining Records; Affidavit of Citizenship; Certificate that no Suit is Pending; Power of Attorney; Protest and Adverse Claim; Non-Mineral Affidavit; Proof that no Known Veins Exist in a Placer Claim, etc. There is also given the U. S. Coal Land Law and Regulations thereunder. The work comprises thirty pages, and will be sold, post-free, for 50 cents. It should be in the hands of every one having any mining interests. DEWEY & CO.,

Publishers of MINING AND SCIENTIFIC PRESS, S. F.

N. B.—We have also added to the above publication, the REVISED STATUTES OF THE UNITED STATES, so far as relates to Mining Laws.

Thanks for Prompt Attantion.

STOCKTON, June 26, 1875.

Messrs. Dewey & Co., S. F.:—

I have received the patent for my invention in wagon brakes, which you prosecuted for me; patented May 11, 1875—No. 163,045. Thanks to you for your prompt attention to the case; you will hereafter be my attorneys in such cases. I recommend all inventors on the Pacific coast to give you a call, which I think they will never have any cause to regret. Very truly yours,

GEO. G. BUCKLAND,
Stockton, Cal.

WOODWARD'S GARDENS embraces an Aquarium, Museum, Art Gallery, Conservatories, Tropical Houses, Menagerie, Seal Ponds and Skating Rink.

Thursday Noon our last forms go to press. Communications should be received a week in advance and advertisements as early in the week as possible.

DEWEY & CO.

American & Foreign Patent Agents

OFFICE, 224 SANSOME STREET, S. F.

PATENTS obtained promptly; Caveats filed expeditiously; Patent reissues taken ont; Assignments made and recorded in legal form; Copies of Patents and Assignments procured; Examinations of Patents made here and at Washington; Examinations made of Assignments recorded in Washington; Examinations ordered and reported by Telegraph; Rejected cases taken up and Patents obtained; Interferences Prosecuted; Opinions rendered regarding the validity of Patents and Assignments; every legitimate branch of Patent Agency Business promptly and thoroughly conducted.

Our intimate knowledge of the various inventions of this coast, and long practice in patent business, enable us to abundantly satisfy our patrons; and our success and business are constantly increasing.

The shrewdest and most experienced Inventors are found among our most steadfast friends and patrons, who fully appreciate our advantages in bringing valuable inventions to the notice of the public through the columns of our widely circulated, first-class journals—thereby facilitating their introduction, sale and popularity.

Foreign Patents.

In addition to American Patents, we secures with the assistance of co-operative agents, claims in all foreign countries which grant Patents, including Great Britain, France, Belgium, Prussia, Austria, Victoria, Peru, Russia, Spain, British India, Saxony, British Columbia, Canada, Norway, Sweden, Mexico, Victoria, Brazil, Bavaria, Holland, Denmark, Italy, Portugal, Cuba, Roman States, Wurtemberg, New Zealand, New South Wales, Queensland, Tasmania, Brazil, New Grenada, Chile, Argentine Republic, AND EVERY COUNTRY IN THE WORLD where Patents are obtainable.

No models are required in European countries, but the drawings and specifications should be prepared with thoroughness, by sble persons who are familiar with the requirements and changes of foreign patent laws—agents who are reliable and permanently established.

Our schedule prices for obtaining foreign patents, in all cases, will always be as low, and in some instances lower, than those of any other responsible agency.

We *can and do* get foreign patents for inventors in the Pacific States from two to six months (according to the location of the country sooner than any other agents.

Home Counsel.

Our long experience in obtaining patents for Inventors on this Coast has familiarized us with the character of most of the inventions already patented; hence we are frequently able to save our patrons the cost of a fruitless application by pointing them to the same thing already covered by a patent. We are always free to advise applicants of any knowledge we have of previous applications which will interfere with their obtaining a patent.

We invite the acquaintance of all parties connected with inventions and patent right business, believing that the mutual conference of legitimate business and professional men is mutual gain. Parties in doubt in regard to their rights as assignees of patents, or purchasers of patented articles, can often receive advice of importance to them from a short call at our office.

Remittances of money, made by individual inventors to the Government, sometimes miscarry, and it has repeatedly happened that applicants have not only lost their money but their inventions also, from this cause and consequent delay. We hold ourselves responsible for all fees entrusted to our agency.

The principal portion of the patent business of this coast has been done, and is still being done, through our agency. We are familiar with, and have full records, of all former cases, and can more directly judge of the value and patentability of inventions discovered here than any other agents.

Situated so remote from the seat of government, delays are even more dangerous to the inventors of the Pacific Coast than to applicants in the Eastern States. Valuable patents may be lost by the extra time consumed in transmitting specifications from Eastern agencies back to this coast for the signature of the inventor.

Confidential.

We take great pains to preserve secrecy in all confidential matters, and applicants for patents can rest assured that their communications and business transactions will be held strictly confidential by us. Circulars free.

Engravings.

We have superior artists in our own office, and all facilities for producing fine and satisfactory illustrations of inventions and machinery, for newspaper, book, circular and other printed illustrations, and are always ready to assist patrons in bringing their valuable discoveries into practical and profitable use.

Scientific and Practical Books on Mining, Metallurgy, Etc.

Published or issued, wholesale and Retail, by DEWEY CO., Mining and Scientific Press Office, S. F.

BY CUIDO KUSTEL,

Mining Engineer and Metallurgist.

Roasting of Gold and Silver Ores, and the Extraction of their Respective Metals without Quick silver, 1870.

This rare book on the treatment of gold and silver ores without quicksilver, is liberally illustrated and crammed full of facts. It gives short and concise descriptions of various processes and apparatus employed in this country and in Europe, and explains the why and wherefore.

It contains 142 pages, embracing illustrations of furnaces, implements and working apparatus.

It is a work of great merit, by an author whose reputation is unsurpassed in his speciality.

Price $2.50 coin, or $3 currency, postage free

Concentration of Ores (of all kinds), including the Chlorination Process for Gold-bearing Sulphurets, Arseniurets, and Gold and Silver Ores generally, with 120 Lithographic Diagrams. 1867.

This work is unequaled by any other published, embracing the subjects treated. Its authority is highly esteemed and regarded by its readers; containing, as it does, much essential information to the Miner, Mill man, Metallurgist, and other professional workers in ores and minerals, which cannot be found elsewhere in print. It also abounds throughout with facts and instructions rendered valuable by being clearly rendered together and in simple order. It contains 120 diagrams, illustrating machinery, etc., which alone are of the greatest value. PRICE REDUCED TO $5.

Nevada and California Processes of Silver and Gold Extraction, for general use, and especially for the Mining Public of California and Nevada, with full explanations and directions for all metallurgical operations connected with silver and gold from a preliminary examination of the ore to the final casting of the ingot. Also, a description of the general metallurgy of silver ores. 1864.

As its title indicates, this work gives a wide range of information, applicable to all vein miners and workers in precious metals, affording hints and assistance of exceeding value to both the moderately informed and the most expert operator.

Price, $5 in cloth; $6 in leather—coin.

BY OTHER AUTHORS.

The Quartz Operator's Hand-Book; by P. M. Randall. 1871. Revised and Enlarged Edition. Cloth bound, 175 pages. Price, $2.

Sulphurets: What They Are, How Concentrated, How Assayed, and How Worked; with a Chapter on the Blow-Pipe Assay of Minerals. By Wm. M. Barstow, M.D.; 1867; cloth bound, 114 pages. Printed and sold by Dewey & Co. Price, $1; postage free. The best written work, and most complete work on the subject treated.

ANY OTHER BOOKS DESIRED will be furnished at the most reasonable rates by Dewey & Co., Mining and Scientific Press Office, S. F.

The Large Circulation of the Mining and Scientific Press extends throughout the mining districts of California, Nevada, Utah, Colorado, Arizona, Idaho, Montana, British Columbia and to other parts of North and South America. Established in 1860, it has long been the leading Mining Journal of the Continent. Its varied and reliable contents giving it a character popular with both its reading and advertising patrons.

Pacific Rural Press,

A first-class 16-page Agricultural Home Journal, filled with fresh, valuable and interesting reading. Every farmer and ranchist should take it. It is immensely popular. Subscription, $4 a year.

Our Agents.

Our Friends can do much in aid of our paper and the cause of practical knowledge and science, by assisting Agents in their labors of canvassing, by lending their influence and encouraging favors. We intend to send none but worthy men.

J. L. Tharp—San Francisco.
B. W. Crowell—California.
A. O. Champion—Tulare, Fresno and Inyo Counties.
John Rostron—California.
A. O. Knox, California.
G. W. McGrew—Santa Clara county.
Chas. T. Bell—California, Oregon and W. T.
D. J. James—Australian Colonies.

The Scientific Press.—This valuable journal entered upon the seventeenth year of its publication on the 4th of July. The steady advance in character, that every reader has noticed in the paper, renders it unnecessary to make any splurge of improvement, and the publishers simply content themselves with the announcement that they will continue to make their paper as interesting as possible. That it is interesting to a large class of readers, the wide circulation and extensive influence of the Press, is sufficient evidence.—*Placer Argus.*

Thoughtlessness.—Persons sometimes return their paper, marked "stop this paper." Their name being pasted on the sheet they think that is all we need to be able to cross their names off. Now that is thoughtlessness. Your P. O. address is needed as much as your name. We have thousands of names arranged only according to locality. Our mailing clerk does not know where everybody lives.

MILL MEN.

Wanted, by a thoroughly practical mill man, a situation as First Engineer, Foreman, or General Manager. Is an engineer and machinist by trade, and has a fair knowledge of assaying, melting, etc. Apply to A. M. KRUTTSCHNITT, North O and Mill streets, Virginia City, Nevada.

$5 to $20 Per Day at home. Terms free. Address G. Stinson & Co., Portland, Me.

1776. 1875.

PROCLAMATION.

July 4th, 1875.

Headquarters Grand Marshal, No. 127 Montgomery street, San Francisco, California, June 17th, 1875.

FELLOW CITIZENS: The near approach of the Ninety-ninth Anniversary of the Declaration of American Independence is the signal to invoke good citizens to aid in perfecting the arrangements for a fitting celebration of the honored day.

Having been distinguished in the appointment of Grand Marshal by the unanimous choice of the Committee of Arrangements, I desire to extend to all military organizations, civic bodies, societies, and to all classes of citizens willing to organize for the purpose, a warm and hearty invitation to join in the memorial honors of the day.

Without partizan or sectional bias, looking only to the glorious national memories of the past, and to the prosperous future stretching far before, let us, dwellers by the Western sea send back a loyal greeting to our fellow-citizens nearer the birthplace of National Freedom.

The first century of American freedom draws to its glorious close. National trials and struggles for existence have not shattered the noble fabric of Republican self-government—cemented as has been by the blood of our Revolutionary forefathers. Looking backward to the early vicissitudes of our national existence, the American citizen sees in the high-souled patriotism of the Revolution the grandest model of duty and self-devotion. Let us fittingly honor the day, the men, the deed. The Independence of America, its proclamation gave hope to suffering millions; its achievement has given happiness to a great nation in wealth and numbers far surpassing the most sanguine hopes of the manly heroes who fought for posterity, who died that we might be free. In peaceful enjoyment of the freedom so dearly purchased, let us be a grateful body of fellow citizens forget any dividing line in the proud boast that we are Americans.

Special invitations will be extended to all accessible associations, and it is enjoined upon all classes of our citizens to organize under chosen officers and receive a proper place in line.

Announcement is made of the appointment of Major R. H. Savage as Chief Aid to the Grand Marshal.

Committees on Finance will be duly announced, and in their visits to our fellow-citizens, the generous response peculiar to California is invoked for the necessary support of such a celebration as will do our loyalty credit.

JOHN McCOMB, Grand Marshal.

Improved Cast and Forged Steel Shoes and Dies for Quartz Mills.

[PATENTED MAY 26TH, 1874.]

Price Reduced to 16 Cents Per Pound.

SAN FRANCISCO, November 10th, 1874.

To Supts. of Quartz Mills and Mining Men generally:

We take pleasure in stating that owing to the rapid increase in our orders, our Pittsburg Manufacturers have been compelled to add largely to their works—a new gas furnace and heavier trip hammer—and are thus enabled to reduce the cost of steel and at the same time produce SHOES AND DIES superior to any yet manufactured. We have consequently reduced the price to 16 cents per pound and solicit a trial order, guaranteeing that you will find them at least 10 per cent. cheaper than the best iron. There are no STEEL SHOES AND DIES made excepting under our patent and sold at this office, or by our authorized agents, though certain Eastern manufacturers advertise STEEL SHOES AND DIES which are only cast iron hardened by the addition of a composition. They will not out-wear two sets of common iron, though called steel. They are very brittle and are not capable of being tempered, flying from under the hammer like cast iron. Our STEEL SHOES AND DIES are in use in many of the largest mills on the Pacific Coast, and all who have tried them pronounce them cheaper and far superior to iron in every respect, even at the old price of 20 cents per pound. Their advantages over iron are cheapness on first cost, increased crushing capacity, time saved in changing and in setting tappets, increased value of amalgam by absence of iron dust and chippings, and a saving of 75 per cent. in freight. It takes 50 days to fill orders from the manufactory East. Price 16 cents per pound shipped at San Francisco. Terms liberal.

Address all orders, with dimensions, to

MINING AND SCIENTIFIC PRESS.

An Illustrated Journal of Mining, Popular Science and General News.

BY DEWEY & CO., Patent Solicitors.

SAN FRANCISCO, SATURDAY, JULY 10, 1875.

VOLUME XXXI Number 2.

Tybo and Reveille Districts.

We had the pleasore this week of receiving a visit from Mr. J. D. Power, of Tybo, Nevada, an old correspondent of the Press. He representa mining affairs as very flonrishing in both Tybn and Roveille districts, Nevada, and gives us some items of interest concerning both placos. At Tybo, he says there are at least 50,000 tone of ore in sight in the Two G mine alone. This is part of the Tyho Consolidated mining company's property, which consists of the Two G, Hnnky-dora, Casket and Lafayette mines, or 3,600 feet in all. It was originally intended to dispose of this property in London, but the owners changed their minds and placed it in San Francisco. The owners are J. B. McGee, J. W. English and Arthnr K. Hawkins.

Tho Two G is the best developed of the locations, bnt tha Casket has an 88-ft shaft in the vein, the Hnnkey-dora an 80 ft shaft, and the Lafayette a 75-ft shaft in ore. Work is being continued on all the mines and averything indicates permanence in tha ledges.

At present there are thirty-five men at work on the Two G. The first tunnel struck a magnificent body of ore. At No. 2 tunnel, 595 feet from the surface, thay have a vein eight fact wide, of ore going from $50 to $450 per ton. On tunnel No. 1, work has ceased at prasaot, everything waiting for the mill and furnace. Thore are sixty men now at work putting up the mill, which is to be a 20-stamp wet crusher. Some 10,000 shares of the stock in this company have been sold for $12 per share. The mines are good and the whole property, Mr. Power thinks, is one of the finest in Eastern Nevada. James Hadson is foreman of the Tybo Consolidated company.

In Reveille district, twenty-five miles southeast of Tybo, there are thirty-two men at work on the Gila mine. The dry-crushing 10-stamp mill belonging to this mine is ten miles from the mine, at the base of tne Diamond raage of mountains. The ore is packed two miles and a half and hauled the rest of the way to the mill. The developments on the Gila consist of a tunnel run 450 feet east from the opening. To test where the ledge went, a winze was sunk seventy feet from the entrance of the tunnel, which winze run down fifty feet, thirty-five feet of the distance ia ore. Forty feet from thatia another winze sunk in a "ohimney." Twenty-five feet from the top of the winze, following the chimney down, the ledge opened out to seven feet. From that depth a drift was started south on the ledge, on a continuous body of ore the whole way. This widened out to eight feet and closed in again to two feet. The drift was continued on for 200 feet with a uniform body of ore, occupying four feet. The pulp at the mill runs from $375 to $390 per ton, and when Mr. Power left Reveille, two weeks since, the ledge was four feet wide, continuing south, drifting at an angle of from 45° to 50° N. E. In the onteide tunnel after cutting the ledge at a depth of ninety-five feet they drifted north a little, following ore for some time. They left the ore to the north and turned south prospecting. Five feet from the cut of the tunnel they struck a body of ore four feet wide which has continued, with intermissions, in segregated bunches, for thirty feet. The foot and hanging walls are perfect all the time. At the south end of the drift there was a solid body of ore five feet wide with good walls, drifting to the south at an augle of 45° to 50°, indicating that it was going down the same as a chimney of ore would, suddenly. Thirty feet from the entrance of the tunnel a winze was begun on the vein. This winze is down twenty-two feet, with a four foot ledge at bottom. The ore assays from $390 to $425 per ton, and there are about 250 tone on the dump. The mill is running day and night, the last shipment of bullion being $16,525.

The West Side is another mine in Reveille district, which ie a promising one. It is located, as the name indicates, on the west side of the mountain, overlooking the valley. This property was discovered about two months ago. It consists of 1,500 feet, and there are 400 feet of vein unoovered, on the surface the ledge being traceable some 200 feet. There are four small shafts sunk, one ten, one fifteen, ona eight and one fourteen feat deep, on a vein five feet wide. The ora is very similiar to that of the Gila, and ia easily worked. There are twenty-five men at work on the mine and mill. The mill has five stamps, and is two and a half milas from the Gila mill. The water supply is perhaps better than that of the Gila, though both hava an abundance from monntain springs. This property is worked by A. J. Mason, superintendent, and is incorporated in this city. It was incorporated with a capital of 10,000 shares, and 20,000 shares were sold in a few hours for $1.50 per share. They have now ample funds to go ahead with, and no danger of assessments in the future.

All of thasa properties are owned principally by Arthur K. Hawkins, J. B. McGea and J. W. English. Tha former is President of the West Side, and Mr. Englieh is President of the Gila. All the developments on these properties and tho purchasa price were paid by these gentleman and their associates. The expenses of purchase and development of the Tybo Consolidated property up to the first of December last, were $400,000. Everything is first-class on the property. Water was brought two and a half miles in a four inch pipe, laid in a ditch two feet deep, and covered in as a protection against frost or injury. It is conveyed to the different works in the same sized pipe.

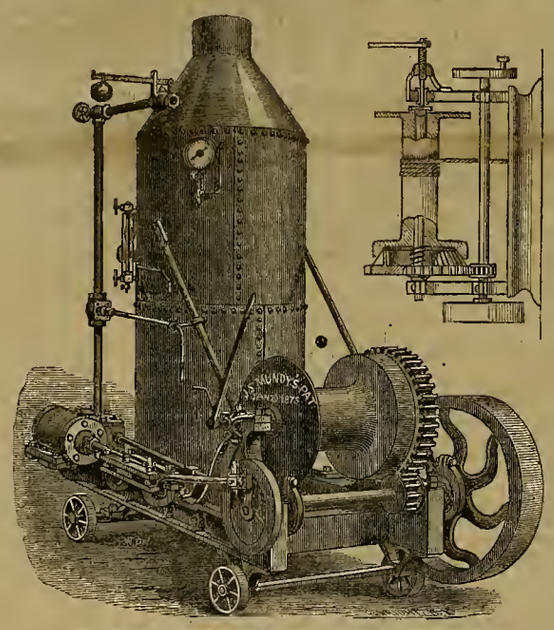
M. D. Howell is superinteadent of the Tybo Conoolidated property. He was formerly secretary of the Richmond Consolidated miuing company at Eureka, and is a man of large mining experience. He is an old California mill man, and practical in every sense of the word. There is a great abundance of wood already at the mill and furnace. The cost of the Tyho property and its development will show the public the promoters require nothing beyond its value, when placed on the market. The mill will put through forty tons of ore in twenty-four houre, and the furnace will run through twenty-five tons a day. The furnace is an ordinary cupola, sixty-five feet in hight.

The American rifle team are having honors and attentions of all kinds heaped upon them by the Irish people. They paid a visit to Belfast on Tnesday, last were received by themayor, cheered by the moh, diaed by the city government, etc. They will be invited to shoot a match against a picked team of English, Scotch and Irish riflemen.

The U. S. steamer *Narragansett*, which has been for the last two years engaged in snrveying the Gulf of California, arrived at this port last Sunday.

Portable Hoisting Engine.

The aocompanying engraving represents Mundy's patent friction hoisting engine, a machine patented this year. The engine is a plain side valve with straight connections and no rocker shaft movement. Tho boiler is well braced on the frame of the engine and the lugs supporting it are alotted so as to admit nf a free expansion of the hoiler without any strain on the frame of the engina. The machines ara constructed of the best materials and the boilers are of extra large size. The cylinder and steam chest have Mundy's improved brass screw glands, which keep tha rods in line and prevent friction and cutting. The engine exhausts by means of a three way cock into or out of tha stack. The pump is fastened on the bed and is worked by an eccentric of the main shaft, thereby avoiding the strain on the cross head, eo oommon with partiee running their pumps fastened to their cylinders and operated from their cross heads.



MUNDY'S IMPROVED HOISTING ENGINE.

The improved patent friction drum is represented as a great improvement, something long needed among parties who use engines for hoisting and pile driving purpoees. The drum runs looee on the drnm shaft, the driving gear being keyed solid on the drum shaft, and wood dovetailed on the side of the gear and turned off to receive the flange of the drum. The drom is forced on the wood by means of a steel screw and pin, thereby forming a perfect friction which will hoist from one to sixty tons, according to the size of the engine. It is stated that the N. Y. Department of Docks have raised a weight of 16,000 pounds easily with a doublo 6x12 engine. The friction also forms a perfect brake in lowering. There is a heavy fly wheel on each engine for running a belt for pumping. On all heavy mining engines the frames are extended out and extra large drums put in. The patentee of this engine is J. S. Mundy, No. 7 Railroad avenue, Newark, N. J.

We learn that the boring oompany's well at San Fernando is now down 179 feet, and is ejecting at tho rate of 4,000 barrels of water a day. A great deal of gas is escaping from the orifice, and the drill is in soft rock.

A great bore is that San Fernando tunnel getting to be. It already extends 250 feet into the eolid rock on the south side of ths mountain.

Notices of Recent Patents.

Among the patents recently ohtained through Dewey & Co.'s Scientific Press American and Foreign Patent Agency, the following ars worthy of mention:

Guard for Wire Ropes in Pulleys.—A. S. Hallidie, San Francisco, Cal. This invention is an improved gnard or keeper for preventing wire ropes and other ropes which are supported in pulleys, from leaving the grooves in which they bear. Where a great length of rope, such as is necessary in the construction of wire rope tramways, and in the propulsion of vehicles along a track, is snpported at intervals on pulleys, some guard or fander is required to prevent the rope from jumping out of the pulley groove. Heretofore twn pulleye have been used for this purpose, one of which supported the rope while the other was placed directly above it, so that the grooves of the pulleys would be opposite each other. This invention is a substituta for this upper pulley. The journal upon which the ropa-supporting pulley rotatas, is secured to tha undar side of tha snpporting beam and projects out far enough beyond the end of tha beam to permit tho pulley to rotate in a vertical plane at right anglos to the end of tho beam. To the upper side of the beam is secured a block, which is so constructed that it will overhang the upper edge of the pulley. That portion of the block whioh is next to the inside face of the pulley extenda down far enough helow the edge of the pulley to prevent the rope from jamping out of the groove, while the portion whioh extends above and across the groove or edge of the pulley will keep the rope down to its place. The space between the outside end of the block and edge of the pulley will serve to admit the rope to the groove and permit the paseage of the saddle shank, and being just space enough to admit the rope into the groove, there will be no danger of the rope getting to the outside of ths pulley.

Dish Rack Attachment for Stoves.—Frank Enos, Mineral City, Nev. This is a rack attachment for stoves and ranges for the purpose of supporting dishes of cooked victuals in cloes proximity to the stove in order to keep them warm. The rack consists of a metal rim or band which is made somewhat larger than the top of the stove and of the same shape, so as to form a square or other shaped frame. One side of this frame rests on the top of the stove, passing across just in front of the pipe or draft hole in the rear of the stove holes. This side extends beyond the sides of the stove and the rim extends entirely around the stove top an inch or two from its edge. The rear side of the frame is attached to the atove by hooks, and the front side is supported by legs. Various devices could he employed for retaining the rack or rim in place opposite the edgea of the atove top, but the main feature of the invention is the rim supported as deecribed, so that dishes, pots, or other culinary vessels can be removed from the stove holes and placed with one edge on the rim while the other edge rests on the edge of the stove top; or so that they will rest entirely upon the rim, for the purpose of keeping the contents of the dishes or vessels warm. This rim or rack will not interfere with ordinary cooking and will be extremely convenient.

A patent for the Canon del Aqua land grant, confirmed to Jose Scrafin Ramierz, and located in Monterey county, New Mexico, about fifty miles from Santa Fe, has been signed by the Commissioner. The grant contains 3,501 acres.

The Amador *Dispatch* says: The machinery to be ueed in the fruit drying establishment of the Ginnochio Bros., in this place, has arrived, and everything will be in "ship-shape" by the time the frnit is ready to he gathered.

Those intersated assert that the new railroad from Colusa to Woodland will be oompleted in time to carry off this season's grain crop.

CORRESPONDENCE.

Colusa County Quicksilver Mines.

The Buckeye.

This mine, located May 22d, 1870, is situated in the western edge of Colusa county, about thirty-five miles west of Colusa, in the Sulphur Creek mountains. It is yet in the hands of the original discoverers, working in all forty to forty-five men, under the superintendency of H. Caswell.

A young men herding sheep accidentelly discovered some very rich ore, thrown out by badgers end gophers, and was lucky in finding the cropping of good mineral. But owing to want of means to open up the claim they began on a small scale, using only a quicksilver tank for a retort; which giving very satisfactory results, they soon had twelve flask retorts running. With them took out $700 in twenty-three days; this part of the work being mostly done by the wife and children of one of the firm.

The proceeds of these, soon built a larger retort, end another, and these grew into a very substantial Knox & Osborn furnace, that it now running right along and since the first of last November has not stopped or cooled off. This is a rare example of what can be done in quicksilver mines

Without Assessments

Being levied or stock sold. The mine is developed by two tunnels, the longer one near 1,000 feet long, striking the mine at a great depth end landing the ore at the furnace, where eight or ten men carefully assort and break it, ready for the furnace. There seems to be an order and plan observed in the whole, and two objects constantly in view, convenience and economy. Their store, bourding house, cottages, shops end barn, would be a good start for an incorporated city, if over in Nevada, and to make such a showing of improvement on a mining property has generally cost large and unjustified assessments. There are many investing in non-paying silver and gold mines, that would do well to look at a better thing nearer home. Monthly yield, fifty to ninety tanks of quicksilver.

Adjoining the Buckeye land and works are

Several Other Claims

Located, and various amounts of prospect works, but at present not doing much work. Sulphur Creek, the name of the postoffice and village, is favored with three saloons and two stores, and a district school of about twenty pupils; is connected with Colusa by an excellent wagon road; tri-weekly stage; has abundance of wood end water. Three miles up the Sulphur creek brings you to the

Elgin Quicksilver Mining Company,

Belonging to Mrs. Wilbur, (of Wilbur Springs), Mr. Smith, and Mr. Chapin; now under the superintendency of Mr. Smith, who is working seven men and running some of the best ore in a small retort. They are getting out some high grade ore. The

Famous Burning Spring

Is situated near by and is truly a marvel and worthy of a lengthy mention, but I am unable to give it here.

Near the bank of the Sulphur creek with its hot water, is an excavation against the bank, as if to open a spring, and here the gas escaping from the slate rock and dirt blazes just as nice as a good house fire. The flickering noise of the flame can be heard for rods around With my hat trim I was able to carry water enough to extinguish the flame for a short time. Dr. Wilhur had commenced his plans and preparations to carry the gas to his dwelling for lighting and heating purposes, but the dwelling was burned, and the doctor was soon called away by death; since his death nothing has been attempted here, as his widow has removed three miles below to the hot sulphur springs, amply fitted up for invalids and tourists.

These springs seem quite noted, especially for rheumatic patients, and cure many by their waters and the hot mud baths. They are spoken highly of for all complaints except consumption.

Near the Elgin mine is what is called

The Agate Mine,

Owned by Dr. Clarke and Dr. Bartlette, who have expended much labor to grade a road, or path rather, up the mountain sides to reach it, and are now getting out a variety of stones of the agate and precious opal family that will ere long produce a sensation among our specimen seekers and our lapidaries. At present they are very quietly developing and testing the qualities and varieties of their specimens.

The Abbot Quicksilver Mine

Is situated about two miles west of the Buckeye mine, and just over the county line into Lake county; located September, 1866, 3,200 feet, now held under United States patent. This mine is prospected and developed by half-a-dozen tunnels, the longest, 488 feet; greatest depth of work, 144 feet; one shaft seventy-five feet to water and all the way in ore. The ore, principally of the sulphuret, is now being successfully reduced by the Knox & Osborn, at the rats of about seven tons per day, which they hope to increase by making some valuable improvements in the firing mechanism of furnaces. The company's principal office is at Colusa, in charge of Jackson Hart. The mining operations and reductions are under the charge of Mr. Aldershey, a practical mining engineer of years experience, who can do the planning, surveying and drafting, and to the smallest particular the manual execution of any part of the operations,—one who believes in the doctrine that the true economy of mining is to put the labor in the right place by making all proper calculations ahead of labor and then do substantial work.

The present prospect of the Abbot is very flattering. To the east of the Abbot and on the supposed extension of the same lead, is the

Excelsior Mine,

Owned by the Disturnell brothers. Their mine now shows an ore face of fifty feet, in which are some very rich strata.

They imitated the example of the Buckeye boys in using the small quicksilver flasks for retorts, and then reduced eighteen flasks of quicksilver. They now have the old Buckeye cast iron retort hired, and are turning out a nice little yield of expense money instead of mortgaging their mine for a working capital. They have out at the mine about six tons of ore, that is estimated at 12½ per cent., and thousands of tons of the same in the hill. Their claim in the hands of capital would soon send a stream of metal into the market, and coin into the dividend funds of the company.

The surrounding country is mountainous, but well suited for sheep, and some for cattle herding; near by is Bear valley, with excellent farms and ample supplies at reasonable rates.

A rich discovery of cinnabar ore was lately made by Mr. Rathborn and others, about two miles from Mr. Ingraham's ranch, west of Bear valley, in Colusa county. The quality is right, it is only a question of quantity, and of this big hopes are indulged. C.

Sulphur Creek, June 19th, 1875.

The Historic Old Quartz Mill.

The history of this mill, belonging to the Mariposa estate, says the Mariposa *Gazette*, is full of interest. It has successively passed through the hands of Commodore Stockton, John Charles Fremont, Fred. Law Olmstead, and others of but very little less note. The amount of gold that has been taken from the vein on which it is located, denominated the "Mariposa Mother vein," runs up into millions. In all the history of mining operations, no parallel instance can be cited where there has been such woeful mismanagement and downright stealing as in this iden ical mill. It was worked in days when but little was known regarding quartz mining, and when labor was high. The men who had it in charge exercised no vigilance, and the consequence was that much useless labor was performed, and much purloining done. The records containing its history are here, and many of our old citizens are familiar with all that took place. They all express the opinion that if properly worked and managed no mine on this coast would pay better, if as well. There stands the huge old edifice, a mournful but eloquent relic of the past, its timbers in a good state of preservation, not entirely denuded of its machinery, and there lies exposed to view the broad vein of quartz, richly impregnated with gold, tempting and inviting its proprietors to disengage it from the rock that holds it fast. It is one of the marvels of the times that, in this gold-seeking age, such a mine of wealth, ready to be blasted and thrown into the mill, should be left undisturbed while its owners expend hundreds of thousands of dollars in uncertain enterprises to reach quartz veins which when struck are no richer, if as rich, as this "Mother vein" has proven itself to be. It has been satisfactorily established by surveyors that this is a continuation of the celebrated Hayward or Chamberlain vein, in Amador county, from which so many millions of dollars have been taken. It has not, as yet, been tested to its full capacity, because of the bungling manner in which it has been worked. If the Mariposa company will not work it themselves, they ought to lease it to those who would. Let them make public the fact that it will be let on reasonable terms, and they will not have it idle on their hands for any length of time.

The grading of the Ruby Hill and Eureka railroad has been completed to the Lawton dump on the Eureka Consolidated line. The surveyors are now engaged running track centers, and will soon finish that part of the work. Iron and ties are arriving daily and being laid. A side track is being put in the rear of the furnaces, and the entire road, the *Sentinel* says, will in a few weeks be in running order.

The White Pine *News* mentions the fact that several parties from San Francisco, owning old mineral locations in that district, are stirring themselves in the matter of patenting their mines. The *News* says they are just beginning to realize that their mines are worth looking after, and to save them from being jumped will patent them. The prospects of Hamilton are improving.

Dryer for Old Varnish.—Boil a small quantity with sugar of lead, and add it to the rest; say one ounce of sugar of lead to one gallon of varnish; or, take turpentine. Do not make it dry too quickly; such varnish will crack readily, and will not stand as well as a more slowly drying varnish.

Eastern Oregon Mines.

Within the past few days we have been talking with some old mining prospectors, and they tell us what we have always thought was the fact in relation to this portion of Oregon. They say this is the best field for profitable prospecting for quartz end other minerals that can be found on the Pacific coast; that they can find plenty of good ledges and mines, but they have not the capital to open them, so it is no use for them to locate claims only as far as they are able to do the work on them to hold them. One of them said to us, "if some good old California prospectors would only come in here and take up some ledges he could show them, and let their backers in San Francisco know the facts in relation to this country, there would be plenty of capital here in a short time to develop mines as fast as they were discovered, and then we would have glorious and prosperous times here." We agree with our friend, and believe as he does, that if the capitalists of San Francisco or the East were convinced of the fact that our mines are as rich as we think and know them to be, it would be but a short time until we would have plenty of capital here to open and develop the hidden wealth of our mountains.

There is, as our prospecting friends say, a vast extent of country in Baker and Grant counties where a pick has never yet been struck, and a great portion that has been prospected has only been skimmed over, and no thorough search has ever been made for ledges that have not made their appearance distinct and plain on the surface of the ground, and not more than one out of twenty, thus discovered, has been went down upon deep enough to enable a good judge to tell whether there was anything there or not that would pay to work. As a general thing the men who discover these ledges have not the means to prospect them, and are letting them lay, hoping something may turn up whereby they may be able to realize something for their discovery.

We want capital that will back the reliable prospector—we want prospectors in whom the capitalists have confidence, and, if they are not among us now, there is room here for them, and when they do come, and make their reports to capitalists who have faith in their discoveries, then our county will indeed, we think, show its vast richness. Our miners and prospectors should be careful and not overrate the extent and richness of our ledges or mines. Do not try to mislead strangers, the truth is good enough. Ask them to look and test the ledges and mines for themselves, and when they find that our ledges and mines will compare favorably with any on the Pacific coast, they will believe it, for the old saying is "that seeing is convincing," and persons must believe in what they see for themselves.—*Bedrock Democrat.*

A Mica Bonanza.

The Salt Lake *Tribune* thus speaks of a very rich mine of mica just discovered close by that city: "The mica mines are situated in North Mill Creek canon, about five miles from the line of the Utah Central railroad. The belt is about 1,000 feet in width and 1,000 feet in length, lying in a granite foundation, through which the mica is distributed in large quantities.

"Sheets have been obtained 3x4 inches, and abundance of the article can be obtained of that size. Development will doubtless open beds from which sheets of any size can be taken. A fine graded road runs from the railroad to the mines. The stream carries water sufficient to run forty stamps. Wood is to be found in inexhaustible quantities within one or two miles from the mines. The fortunate owners are Jerome Cross, Doc. Smith, and the Gray boys.

"The uses to which mica are put are almost numberless, a few of which we will mention; 1st. In sheets, for headlights in vessels, fronts in stoves, and in other places where it is exposed to severe heat or other agencies that would destroy glass. 2d. It is pulverized, and used largely in the manufacture of bronze, paints, and coatings for reflecting surfaces, such as locomotive headlights, reflectors and mirrors. Its value is, in sheets of various shapes and sizes, from 2x4, 3x3, etc., up to 10x12, and 12x15, from three dollars to nine dollars and a half per pound. In small masses, suitable for pulverizing, from seventy-five cents to two dollars and a half per pound, according to the quality.

"The amount in sight was almost incredible. Thousands of tons are in view, and the boys informed our reporter that they can easily ship a car load per week with a working force of four men. A car load (ten tons) of the lowest priced sheets would bring the neat little stake of $60,000. Taking it all in all, we unhesitatingly pronounce it one of the most valuable discoveries, both in a scientific and pecuniary point of view, yet made in the Territory. Analyses of specimens sent to San Francisco and New York prove this to be the genuine mica of commerce."

A Steam Magnet.—M. Donato Tommasi states that if a current of steam at a pressure of five to six atmospheres is passed through a copper tube of 0.08 to 0.12 inch in diameter, and coiled spirally around an iron cylinder, the latter is magnetized so effectually that an iron needle, placed at the distance of an inch or two from the steam magnet, is strongly attracted, and remains magnetic as long as the steam is allowed to pass through the copper tube.

Carrara Marble.

The working of the quarries of Carrara dates back to a very remote period. Under the Roman sway, these marbles were known and highly appreciated, and their reputation was such that they soon displaced the Grecian marbles of Paros and Pentelicus. The great portion of the monuments of Rome, and especially the Trajan columns, were constructed with marble from Carrara.

At the present day, this same stone gives rise to an important trade, and the little town of Carrara possesses no less than 720 quarries, of which 450 are now in full work. The working of these different quarries furnished, ten years ago, 50,000 tons, representing a value of about $800,000. In 1873, 97,940 tons were quarried, the value of which reached the amount of $1,800,000.

The marbles included under the name of Carrara are of several kinds and different qualities. The principal quarries belonging to this town, and which bear the names of Ricceaglis, Colonnata, Pisstrone, and Muglia, produce the most celebrated marbles. They are classed thus:—Statuery marble of first quality, veined marble, Bordiglio marble, and clear white marble. All the famous sculptors of the Renaissance period employed the first quality of these marbles for their *chefs-d'œuvre.*

The veined marble, more especially used in churches, for altars, tombs, etc., is less esteemed. The clear white marble constitutes the commonest variety, and gives rise to the most extensive trade; it is furnished to modern sculptors and architects in considerable quantities. This, again, is divided into different qualities, bearing the names of the quarries whence it is extracted.

The town of Carrara, the most active center of this branch of industry, possesses on the river Carrione forty-two sawmills, and in the town itself, or its immediate vicinity, there are 115 establishments where the marble is cut into blocks, polished and sculptured. More than 4,000 workmen, without counting their wives and children, are employed in the different operations of quarrying or polishing.

The polished or worked marbles are sold in Italy; the greater portion, however, is exported to England, France, Germany, Russia, Holland, Belgium, and often even to India and Australia. The provinces of North America have for some years past imported considerable quantities Notwithstanding the distance and customs dues, the Carrara marbles have become quite the rage in America, and every month blocks are sent out cut, numbered, and arranged for large constructions.

The trade in all the Carrara marbles is in the hands of Italian firms. Some English and American merchants have started two very important establishments in the town, but the Italian houses are the most numerous and extensive.

There are several other small towns in the neighborhood of Carrara, in which fine quarries are found, and all of which do more or less business in the way of producing marble for export. The small town of Massa has during the last few years taken an important part in the marble trade; it possesses 127 quarries in full activity, supplying 16,000 tons.

Among the best known of the smaller towns, is Aithissima, which furnished all the marble employed by Michael Angelo in the immense works which were entrusted to him by Popes Julius II. and Leo X. This quarry is still worked, and yields very fine statuary marble. The quantity it exports is estimated at 20,000 tons.

Other beds of marble are met with at different places in Tuscany, at Pieta Santa, and in the Apaunines, but at no other spot does the working attain the importance and the celebrity enjoyed by the marble of Carrara.

Thorough Workmen.

Says an exchange: "There is no more honorable position in life than that of a good craftsman in a successful occupation. His horny hand is a more honorable badge of public service than the bejeweled digits of the dainty clerk or man milliner. His labor-begrimed face or greasy working dress are proofs of the exaltation of his rank among men. An honest, competent workman has peers, but no superiors. But to deserve all his honor he must be competent—skilled in the mysteries of his craft. And it is no use for people to say that their superior intelligence makes up for everything; for a man with the wisdom of a Solomon could not constitute himself a perfect artisan without the practical experience which makes a man such. Journeymen are turned out in multitudes day by day, who have hardly an idea of the first principles of their trades; and many young men, hardly yet of age, are found bold enough to profess a thorough knowledge of two or more handicrafts, any and all of which they really know little or nothing about. Ask employers from whence they have their most skilled laborers, and they will tell you that they come from those workshops where long apprenticeships served to turn out thorough workmen; where engineering is not learned in a year—shoemaking in a month—or printing in a few days. There are many reasons why this whole subject of mechanical training should be pressed upon our young men who expect to live by mechanical labor. The great enemy of the workingman is the crowd of bad workers who are admitted to his status without the proper experience for which he has paid years of effort.

SCIENTIFIC PROGRESS.

Action of Sunlight upon Precious Stones.

Dr. Schnanss has directed nttention to the fact that certain minsrals are quite sensitive to ths action of the light. To many this mey sssm qnite snrprising, slthongh soms casss of this kind hsvs long heen known to minerslogists. Strangely enongh, this propsrty sxtends to the very bard minsrals, and reaches its mexiмam in ths very hardsst of all minsrals, ths diamond. Accordiag to Dr. Flight, under csrtain circnmstances ths colored diamond is as sensitive to light as chloride of silvsr. The ancienta knew that certsiu colored precious stones gradually grew palsr in the snnlight, and thet this was very distinctly the case with tha hesntiful grass green chrysoprass. They said that, when worn for a long time sst in a ring or pin, it finnlly lost a grsater part of its hsantifal oolor; nnd that this could he recovsred hy wrapping it up in a cloth eoaksd in wine and keeping it in a celler. Ths latter is cvidently one of the numerous phentasies of that sge, hat ths former statemsnt is a fact. Even the mnch harder, traasparsnt, dnrk green emsrald is also influsnced by light in time, ee the nnthor found to hie sorrow in the cnss of an emerald ring, which he hed worn ssvsn years.

The diamond, however, exhibits the most intsreeting phenomsna uadsr this influence. If colnrsd diamonds are highly heatsd, the color disappeare more or less completely, and in most cases permansntly. Sometimes, the color is merely ohangsd hy ignition, and the originnl color may reedily he restored by the influence of the snn's light. A diemond merohant named Martin sxposed a diemond to a very high tempersture, in ordsr to destroy its hrownish color, bnt ths stone hecame of n permanent rose red. Coster treated another diamond in tha same wey, and that too, turnsd rose red; hnt tha moet remarkable pert was thet this color wes only permanent in the dark, and dieappserod in four or fivs minutes if expossd to the aan's light, the stone neqniring a weak hrown oolor. This change also took plaes in a room where the light was hy no means bright. Anothsr diemond, of a dirty yellow color, was ignited in a current of hydrogsn in a porcslain tnhe and allowed to cool there. The color disappsared, hnt not the luetre. If this epscimen were sxposed to diffused light for six or seven minutee, its original yellow color retnrned. The experimsnt was repented in this way, the stone heing hsnted in chlorine gas at as etrong a heet ee conld hs ohtained hy saturating the gas ussd with benzol vepor; it was ferther heated at a lowsr tempsrature in a meroury hath, the diemond heing wrappsd in platinum foil. Each time the color disappeered snd remeined ehsant in the dark, hat ae soon as the etone wss exposed for a few minntee to diffnsed daylight, it regained its yellow color.

Thsse phenomene ere thought hy Dr. Schneuss to he related to that of phosphoresoence. In eddition to the cases mentioned hy him, we would rscall the fact, usuelly stated in text bocks on mineralogy, that n variety of topez from Brezil, when heated, assnmee a pink or red hne resemhling that of the Balss ruby.

The Mechanical Force of Light.—It mey not he altogether premature to teka a anrvey of the poasihle applicatioaa of the new power which Mr. William Crookea haa shown to he derivable from light. Seeing that, hy meaaa of the sun'a direct reys, he hae heen ahle to canse the venes of his emall radiometer to revolve four timea in a aecond, it becomes evident thet, with lerger end improved eppliances, we may hope to ohtein motive power cheaply from a practioally inexhanstible aonrce, namely, the ann itself. The fact thet luminone undulationa are capahle of exerting a motive force, of a nature so grosa as that required to turn the vanes of a poised croas, will aleo render the comprehension of the chemical disturhances which are often effected hy light, and which are exemplified in the union of ohlorine with hydrogen when axposad to sualight, in the production of the photographio imege, etc., a matter of maoh lesa difficulty than it waa heretofore.

The discoverer of these extraordinary phenomena confessea that he himself is unahle to account for them hy any eatisfactory theory, and wishes to avoid proposing any until a auffioient numher of faota have heen aocumnlated. Tbe facts then will tell their own tale.—*English Mechanic.*

Variation in the Earth'a Temperature.—M. Wellman, after reducing the hourly obsservations made at Berne, Switzerland, for aeven yeara, and deducting therefrom the lawa of dinrnal change of temperature, hae investigeted the effect of cloudinese on the daily variation, especielly at night. He finda that the radiating power of the earth'a aurface is everywhere and at all times the same. The temperature in the morning ie, he atatee, five or aix degreee higher in cloudy weather than when the weather ia olear. Aleo, that the aimple atmoaphere of the earth eurrounds it like a proteoting layer of clouda, and that without thia the emrth would experience daily an enormous variation in temperature. Even the clear aky, or rather the moisture preaent aa an invisihle vapor, protects the earth with an effioienoy equal to about one-third of that exerted hy a layer of clouds, against too strong a daily change of temperature.

An Eccentric Star.

The most singular fact connected with the proper motions of tha sters is that one or two stars are flying through space with such enormous rapidity that the combined attraction of all the stars visihla with the telescope could nevsr stop them. This sssms to hs especially ths case with a smnll star, invisihls to the naked eye, dssignated in astronomical literatura ss "Groombridge, 1830," from the name of the astronomsr who first recorded ita position.

Tha rate of motion of this star is ahout seven secoads per year—the greatsst sver known. It was hencs conoluded that it must hs very nsar us, and a nnmher of astronomsrs have sought to dstermins its parallax, hat have found it to he only nhont a tenth of a second. Its apparent motion in a yeer heing seventy timss the distance from the earth to the snn in a year, or 18,000,000 of miles every day, and more than 200 miles every second. From what we know of ths distribution, massss, and numhsr of ths stars, it seems prohahls that the attraction of all the hodiss in ths univsrse can nsver stop this headlong spssd nor hring this slar into nny orbit, and thet consequently it will pass through onr univsres, and leave it entirely in its passage through infiaite spacs. If we had accurate observations of the star'a position 3,000 or 4,000 years ago, we could speak with more certainty of its dsstiuy. Ws may expect that our poetsrity of a few thousand yeare hence will, hy the aid of the observetione and tahlee we shall transmit to thsm, hs ahle to come to a dsfinite conclusion respecting the ngs and the strnotura of the universe.—*Harper's Magazine.*

A New Method of Preparino Plaster of Paris for Caete.—Not a very long time since some lucky individual struck upoa the happy thought that plaster of paris wonld hs improved by mixing it with a solntion of alum, end snch in rsality proved to he the case. This induced a Frenchmen nemed Landrin to study the aotion of the alnm in this case, and he arrivsd at the conclusion thet its principal *role* was to convert eny ceustic lime, of whioh thers is always more or lsss present, into a snlphate. Starting with thie idee, he then attempted to accomplish the aeme result hy the use of otbsr sulphatee, and in this he succesded. Nsxt he tried the effect of using just enongh dilute snlphuric acid to effect this convereion into sulphnte, and afterwards oelcining it. Finally, he ascsrtsined thet the quicksst and simplest way was to immerse the nnhurnt gypsum for fifteen minutss in water containing eight or ten psr cent. of sulphuric acid, and thea calcine it. Prepered in this way, it set slowly, hut made excellent oests, whioh were perfectly white, instead of the nsnal grayish tint. The latter ie dns to the destrnction of a small amount of organio mattsr hy the slight exoess of sulphuric acid.

Interesting Experiments.—At a lete soirse of the Royal Society of London, several very interssting and instructive experiments wers performed illustrative of ths new and remarkahle phenomena in relation to heated iron—one, the lengthening of a har of soft iron within a helix of wire hy heat; another showing the remarkahle and anomelous changes which take place in the heeting and cooling of iron wire. Thns, while the iron ia first heating there ia a sudden coatraction or cooling. Aad eo again, when the heat is cut off, the wire cools a little, and then suddenly reheata and glows, afterwarda quietly passing down to a hlaokness. Now, the notahle points of these jerks or changes ere thet the iron, in the firat instence, loeee ita megaetism; and in the last jerk or oecillation regaine it.

This was the same meeting at which the recent discoveriea of Mr. Crookes in relation to the impect of light were ahown, aad which have already heen desoribed in these columna. The meetiag wea one of unueual interest, hoth to those present and to the canse of progressive soience.

Coggia's Comet.—Secchi hea jnst puhliahed some of hia recent observations on Coggie'e comet. He oombinea the spectroscope and polariscope with hia telesoope; the spectroscope ahowed that there were two apectra, one continuona and the other consisting of lnminous hands, agreeing with those of oxide of carhon; while the polariscope ahowed thet the latter apectrum was original light, while the continuous spectrnm wae reflected light, alao showiag that the latter came from the direction of the aun; conaeqaently that the contiauoua apectrnm was reflected sunlight. He proved thua that this comet ehone not only with reflected snalight, but hy ita own light alao, thereby revealing the natnre of its original luminosity. This is an instance of the highest dagree of refinement as yet ohtained in modern aatronomical reseerch.

Parasites on Wasp Stings.—A oorrespondent of the *Scientific American* saya: "The other day while I wae dissecting a waep, I took out his eting and found upon it a paraeite. It was oval in shape. Its lega had heirs around the jointa and around the feet. Its head was small oompared with the hody. Its *antennæ*, two in number, consieted of two joints; from the end projected two haire aa long ae the other part of the antennæ. Ita color wae white. If among your renders there ia one who can inform me oonoerning this parasite, I would he very glad to hear from them."

The discovery of another small planet, No. 144, haa been made hy Perrotin of Marseilles,

MECHANICAL PROGRESS.

Locomotive Construction.

Qnits a lengthy discassion was held hy the lete Convention of Railway Master Mechsnics, held at Cooper Iastitnte in New York. A committes had bsen eppointed et the meeting a yssr ago to collect facts with regard to locomotive construction, wear, eto., snd rsport the same to ths next suhsequent mssting of ths association. Circalars wers sent out to the vnrious locomotive huilders and railroad snperintendents, eto., from whom nnmerous replies were rsceived, which wsre colleted for the use and informstion of ths convention. No rsplies hsd hesn received which point to any improvements in the construction of boilers tending to iacrensed economy in fuel. Ons of the committee had tested a device for increasing hsating surfaco hy inssrting a numher of osst iron hollow glohss sscnred hy a neck into the crown sheet. While no accurate expsriments have heen made, it ie evident thnt some saving hes been effectsd, nnd there hne heen no trouhls from leaky joints or nnd eettling in ths glohe necks. A similer device is in use on marine hoilers. No replies have hsen receivsd concarning the Wsston boiler; and whils soms tests have hsen in progrssf, no detsils have heen resived. Rsplies received from msmhsrs using the Jauriet fire-hox do not enahla the committes to draw nay accurate comparison hstwssn it and tha ordinary fire-hox with hrick arch.

The uss of hnlanced valves eppeers to he sxtending, hut no dafinite advencs is reportsd. The committea helieve that chsepnese of construction may he promotsd without inonring risk of brsaksgs and with good reenlts as to wear, hy using cest iron for links.

The committee have rsceived no informstion leading them to helisve that sny satisfeotory improvemsnt has hsen made in spark arresters.

Oue of the membsrs, on n receat visit to Englsnd, wes forcibly impressssd with ths fact that no trouhle is there found from the throwing of fire, and wae lsd to helieve that it is worth a cerefnl expsrimsnt to dscide whether the arrengsment of nozzle and steck there nsed would give good resnlts in this country.

The committee visited one road where a Fairlie donhle trnck engine, as modified hy William Mason, has hsen in use twelve months with exoellent results. It is hslieved to he too soon, however, to pronounce sny opinion on this pattsrn of engins, espscielly in view of the heevy strains thrown upon the hoiler. If a powerful engine is nseded, those of the consolidation pattern are helievsd to answsr evary purpose.

Air Brakes.

The committes, while admitting the advantages of ths Westinghouse hrake, helisve that the air hrake of the future must oombine thoss advanteges with a simpler and cheeper compresssing apparatns, but in what way thet can hs attained is a prohlem yet to he eolved.

Rsfsrencs is mado to the Hsndsrson hydraulic brake, recently tested on ths Weetchester and Philadelphia road, and to the McBride hydraulio hraks, which is similer in principle to Henderson'a, hut differing in details, McBride having edopted the Westinghoase car fixturea complete. The committee ia of opinion that a flaid like water, having lesa elasticity then air and a alower movement, can not he ao deeirahle ae a means of transmitting power to a brake. Much atresa is laid hy inventora of brakes on their ability to make short stops, hut these ere too frequently accompanied with that sndden end disegreeahle concussion which the air hrake avoida.

The report containe a careful calculation of the retsrding power exerted hy a good continuous hrake in stopping a trein, say of engine and six cara, weighing one hundred and sixty tona in ell, and at a apeed of forty miles an hour oa a atraight treck, and enggests the compariaon of the theoretical resnlt with those ascerteined hy aotual experiment.

The committee regret that no reporta were received from roeds usfng the Smith vacnum hrake, ae a comparison of resulta with the air hrake would have heen inatructive. The Westinghouse air brake is now in use on over one hundred roads, the Smith vacuum hrake on thirteen, and the Loughhridge hrake on two.

Novel Marine Enoine.—A new marine engine, designed to economise apace, and to do away with all elides, eccentrics, link motiona and other reversing gear, has recently heen tried in a small steam yacht in England. It conaieta of three cylindera plecod side hy aide and connected hy a peculiar aystem of ateamporta that open and close hy movements from the three piatons that are mede to act as slidee. A three-throw crank joins the piatons to the ahaft and the three piatons; three connecting-rods and the crank make the working parts. The ports all meet in a three-way cock, and by ite movement the engine starts, stops, and reverses at will and inetautly. The cylinders and atroke are each seven inchea, and under ninety pounda preasnre, and 380 revolutions; the engine indicated forty-horae power, and the yacht made thirteen milea against a alack tide in seventy-five minates. The engine ia attracting muoh attention among engineers and hoat owners. An engine having three cylindera gronped together haa also heen recently patented in this country, but, from the drawinga publiahed, it aeems to he more complicated than the English engine.

Alloys of Platinum and Iron.

M. H. Sainte-Claire Devills and M. Debrec are engnged in ths study of the alloys that mey he made of pletinum with the oommon mstals.

In thsir experiments they havs ascertalnsd a method of separeting pletinnm from iridinm and iron, which they promiss to publish.

When oxids of iridinm is treated with a cnrrent of hydrogen, the iron hecomes metallio at a temperatare ranging from 200 deg. to 600 deg. centigrade; but thsn the metals are ellied, for if they are digested in hydrocbloric aoid, it is with difficnlty that a fsw hubbles of hydrogen ars ohtsinsd and a small qaantity of tha iron dissolvod, sven whsn this mstal sxists in the alloy to the extsnt of tsn psr csnt.

Iron end iridium, then, unite at a very low tempsratnre, nnd the chsmists nhove mentioned believe thst the same is ths cass with iron and platinum. M. Dsville does not agres with M. Dauhrse that iron will unite with pletinum ta the extent of nineteen psr csnt., although ths fact seems to he indiceted hy the natural megnetic platinum. According to Bsrzelins the highest proportion would he 12.98 per cent. The grannlee of netive platinum contain on an averege about five to six psr cent.

There are reasons for helieviag that native pletinnm, which is sometimes accompanied by netive iron nlmost pure, is of mstsoric origin; hut M. Boussingault found native platinum in the eoil in America.

The cupelletion of ferrnginons platinum is eeeily effected in calcareous crucihles. The platinum, like silvsr, contains lead end antimony. Iron oxidizes it like lsad, snd the magnetic oxids thus produced melte, bnt, in nniting itself with ths lims of the furnace, predaoing ferrite of limc, which is absorbed hy the walls of ths furnace. These ere, therefore, not inactive, as in the cupellation of silver. Finally, oemium and rntheninm, like antimony, produce volatile oxides whlch escape in the form of smoke, of osmic seid, and oxide of rnthenium.

Platinum which it is desired to purify from iron, may he cupelled in chlorine. Platinum hsated to 1,200 deg. or 1,500 deg. in chlorine, hecomes transformed into brillient crystels in all the hot parts of the apparatue. M. Cloez had previously caased platinum to crystsllize hy similer means. M. Baudrimont hes prodnced the seme siffect in the vapor of psrchloride of phosphorus.

The Slag Question.—The utilization of tbe sleg from furnecee, after long discussion, has pessed the experimentel and reached the profitahle, practical stege. Its reduction to a grenuleted suhstance hes opened a wide field for its use in verious arts. As a vitreous eand, it is mads into bricks hy mixing with a anitahle oement, and, mingled with lims, it mekes a good mortar. The hricks are prsssed and sun-dried at a cost of twenty-five per cent. less than common hricks, and as they are white, they ere qnite popular with builders. The saad, scattered on unhurnsd clay hricks, givss thsm an saahled face whsn hnrned, and, hy mixing with fire-cley, an exceediagly refrectory firehrick is produced. By verious other prooesses, this useful sandy prodact ia mede into cement, shingle for road-heds, hrick-dust for flooring, and for hedding in which to run hot metal in making pig iron. It hes also heen used for hallasting railroads, aad for ship'a hallast; hnt the demand for slag hricks is so good that it is thought theae two merketa will eoon be denied. The most common way of treating the slag is to run it from the furnace into a powerful atream of water that falls into n tsnk. The velocity of the water carriea the sand into the tank, end the water flowing under the molten metel is partly converted into steem thet materially aids in shattering and disintegreting it. From the tank, the sand ia raised hy means of an elevator, and the whole apparatus only demands the attendance of two hoys to keep it stirred in the tank, and power to move the elevator.

New Way of Cutting Veneer.—S. C. Carpenter and Dr. M. E. Williams, of Green Bay, Wis., have constrncted a novel and auocesaful machine for cutting veaeer. There ie a machine for cutting veneering from reund blocks, but it ia quite different from this. In that machine the knife is parallel with the log, and in eome kinds of wood the heanty of the grein is lost, while with the knife aet at an angle it is preserved, and this ia the merit of the new machine, which has a conical-sheped catter like a penoil eharpener, and commences cutting at the end of the log, the log feeding into the knife or the knife to the log on a lathe, the veneering coming off in the shape of a scroll. The machine outa the veneering one-twenty-fonrth of an inch thick, and the log would therefore out about 24,000 feet.—*Western Manufacturer.*

Compensating Cylinder.—A Bessemer hlowing engine recently erected at Pittsburg exhibits an interesting featare in a compensating cylinder designed to helance the thrust and pull of the engine. A small cylinder, standing next the steem cylinder, has ite piston-rod conneoted with the cross-head eo as to move it. A pipe from the hoiler opens into this cylinder below the piston, and there are no valves or alidea. The ateam flows freely in and out aa it moves up and down. The reault is, that the down atroke pushes against the elaatic cushion of the ateam, and the up atroke ie aided hy its pressure, and the thrust and pull of the engine is in a meaaure compensated and relieved.

MINING SUMMARY.

THE following is mostly condensed from journals published in the interior, in proximity to the mines mentioned

California.

AMADOR.

THE GOOD HOPE MINE.—Amador *Dispatch*, July 3: We are informed by Mr. Charles Peters, that he intends commencing work on the Good Hope mine, a short distance from town, immediately after the 4th. We hope that the work may he rapidly pushed forward, as there is but little doubt that the mine will prove very valuable if capital can be induced to thoroughly develop it.

CONTRA COSTA.

MORE COAL.—Contra Costa *Gazette*, July 3: Some 2 months since we noticed the fact of the existence of what appeared to be a good vein of fine coal at the head of Tassajara creek, on the claim of Sangmaster. We now understand that Mr. J. W. Dougherty and other persons of ample capital have associated with Mr. Sangmaster to open and work the vein, which is believed to be a heavy one of very superior coal.

THE LAFAYETTE MINE.—We learn that preparation is being made to put up a small mill at Lafayette for test working of the gold and silver bearing rock which seems to abound in that neighborhood. This machinery can be conveniently operated with the steam power of the flour mill, and will afford the best means of determining the value and working qualities of various descriptions of rock there in which these metals have been or may be found.

CALAVERAS.

"CLEAN-UPS"—GOOD RESULTS.—Calaveras *Chronicle*, July 3: In the language of the market reports, quartz "is lively." A number of up country mines, situated in the West Point and Mosquito districts, have cleaned-up during the week with results calculated to increase confidence in the permanency and importance of our mining interests. First on the list comes the celebrated Haskins mine, at West Point, with a clean-up of $10,000, the product of 60 tons of rock! That is an average yield of $166 per ton—as rich rock, we believe, as is mined in any portion of the State. For unassorted ore the product is absolutely enormous. This is not the first big clean-up from a small quantity of rock that has been made at the Haskins mine, and will not be the last by any means.

The crushing of one hundred and fifty tons of ore, taken from the San Bruno mine at Mosquito gulch, yielding $4,100—an average of nearly $28 per ton. The rock was unassorted, the entire ledge being taken out and put under the stamps. The quartz was mined in the 300-ft east level, and there is more rock, of a better quality, even, than that crushed, to be stoped from the chimney.

A crushing of rock from the Rickman mine in the Mosquito district—a recent location—has also lately been made. Thirty tons of ore were put under the stamps, yielding an aggregate of $1,200. When we state that the ore was taken from a depth of only 28 feet from the surface, the yield—$40 per ton—is marvellous. All the indications are for the development of a permanent, valuable mine.

A small quantity of rock—eight tons—taken from the old Vance mine near Mosquito, paid $264. That is an average yield of $33 per ton. Pretty good, considering that the rock was a "prospect lot" taken from an abandoned mine.

Twelve tons of ore taken from the mine owned by Messrs. Logeman & Rodgers, at Mosquito gulch, netted $185. The rock was taken from near the surface, and the prospects are good that the next crushing will yield more largely.

WEST POINT DISTRICT.—About $10,000, the result of 60 tons of ore from the Champion, were taken, as usual, to Volcann, Amador county, the gold dust market for this district.

The steam hoisting works for the new working shaft of the Mina Rica are completed. The shaft is now 175 feet deep.

The Enterprise Consolidated is the most energetic company in the county.

GLENCOE DISTRICT.—San Bruno and two other mines cleaned up large amounts lately.

Garland's 18 stamp mill is taxed to its utmost capacity. Some 100 tons of high grade ore are now awaiting their turn to be crushed.

PINE MOUNTAIN.—Inyo *Independent*, July 3: The prospects are that the Broder-Moffatt furnace will steam up in less than twenty-five days, possibly in half that time. The saw mill is now ready for operations and will be cutting timber the coming week. A contract has been let to furnish 100,000 feet of logs at the mill, which for a time will be kept going day and night.

MARIPOSA.

RIVER TUNNEL.—Mariposa *Gazette*, July 3: Recent developments in this great enterprise, which is superintended by our friend Burr, are of a very encouraging character, and appearances indicate a near approach to the vein. The heading is solid serpentine rock, and advances at the rate of about seven feet a day. Owing to the very large amount of rock taken out it is only possible for the machines to run sixty hours in the week. The rest of the time is taken up in removing the debris. Water is now gradually increasing and is regarded as a favorable sign, especially as the rock for the last two hundred feet has been very dry. It is proposed to cross-cut at one thousand feet and intersect the vein, which event may be expected in September. This will give the miners back-stopes of about four hundred feet in hight, increasing in extent as the tunnel advances. Since the last information reached us regarding the work, the heading has advanced to nine hundred and seven feet, and the last one hundred feet before the cross-cut is now in course of extraction. A great advantage was gained by introducing ventilating boxes from the Princeton fan, now set up at the river. During these hot days it is a positive comfort to enter one of these underground chambers and remain for a while.

NEVADA.

NORTH STAR.—*Foothill Tidings*, July 3: Rumor has it that the old North Star mine is to be started up again soon with a good force. It has been a mystery to those who knew the condition the stopes were left in—pay ore as plentiful as could be desired by a thorough business owner—why this mine was shut down, and it is sincerely to be hoped that whatever the reasons were there is foundation in the rumor of resumption.

AROENTA CONSOLIDATED. — Some splendid specimens of gold bearing quartz brought in from the croppings of this property this week turn our attention to progress thereon. This is an enterprise lately brought to life through the influence of some of our energetic, go-ahead citizens, by the consolidation of four parallel claims of 1,500 ft each, situated out near Deadman's Flat; one of these claims being an extension of the now noted Pittsburg mine. A short shaft upon one of the claims developed ore which worked $94 per ton at the mill, and also the fact that water came in too abundantly for this way of mining. Hence the consolidation of the four locations and the selection of a point from which a tunnel may be run in to open up the whole very cheaply and give in some places 200 ft of "backs." Some delay in getting lugging and timbers hauled prevented the starting of the tunnel as contemplated, but work will begin thereon in a few days and be pushed ahead as rapidly as possible. Such rock as we saw this week, brought in by the boys from the cropping of some of these claims, is not often found, and the miners who worked in the shaft till driven out by the water say there is plenty of gold in the rock.

NORWICH.—This is the name of a mine located on the first day of January of the present year, by Mr. James Pollard of this place. Many years ago Mr. Pollard worked awhile on this same ledge, and became so thoroughly impressed with its value that he did not let a moment pass beyond the time it became relocatable under the U. S. law before he took up a claim of 1,500 ft thereon. Subsequent explorations have proven the correctness of his estimate of the mine; the ledge already, at a depth of only 15 ft, being 18 inches thick and showing free gold in such quantities as to make an old prospector's eyes open wide, and plenty of galena and iron sulphurets. This mine is situated on the west bank of Wolf creek, below Boston ravine, on the celebrated Massachusetts Hill or Rocky Bar range and gives promise of redeeming the reputation of that once noted range. Several practical miners have associated themselves with Mr. Pollard in the ownership of the Norwich and the work of opening it up now goes on night and day.

PLACER.

GREENE MINE.—Placer *Herald*, July 3: The Greene mine is again running at full blast. This mine bids fair to do much good for the district and its owners, yet. The last run averaged about $21 to the ton, which is, to say the least, good. The west drift, as it is being driven ahead, develops a continuation of rich rock.

THE quartz mining interests in Ophir and Newcastle districts seem to be steadily on the increase. All the mills are kept running steadily, and in almost every instance, on remunerative ore. It is more than likely that one or two new mills will be erected at an early date.

THE OPENING DAY.—Last Thursday, the 1st day of July, 1875, though allowed to pass with but slight demonstration, marked a grand epoch in the history of Auburn, and we may say of Placer county. That day the Auburn gravel mining and ditch company turned the water through their new ditch and started two large pipes to washing out the rich gravel of Grizzly hill, located about three miles northeast of Auburn. This one company, whose courage and capital have so successfully overcome the obstacles in the way of opening up this new source of wealth, have ground enough to keep them washing for fifteen or twenty years, and theirs is but a garden patch compared with the immense fields of gravel lying near this town. The engineering feat of bringing water to these claims, through open ditch and pipe, the latter of which is over two miles in length, forming two inverted syphons on its line, and delivering the water on the claim from the main pipe, something unparalleled in the history of hydraulic mining, is due to the great skill of one of the best hydrostatic engineers in the world, H. Sohussler. But notwithstanding this new feature, the success of which was by many considered doubtful, everything and every feature of the outfit had been so well considered and closely calculated that when the water was turned on, all things worked together like a charm. Even the most sanguine were happily disappointed in the perfect success of the works, as scarcely a bobble occurred from the beginning to interrupt the steady progress of the giant work.

SAN DIEGO.

THE MINES.—San Diego *World*, July 3: We hear the work is proceeding now quite well at the Minerva, where they have a seven stamp mill. The yield of gold is reported as satisfactory, and the work on the mine is being pushed along under the management of Mr. Murphy, late of the mint at San Francisco. It is expected that this mine will render a good account of itself in due time.

The Oriflamme, near Julian, is reported as looking well, and the work being done gives a profitable yield.

The Tom Scott is being worked, and it is said to be in a satisfactory condition in all respects. Captain Frary, we believe, will make Tom tell well before a great while.

At the Stonewall there is little doing at present, except to pump out, and keep it ready for business, when the owners are ready.

We hear nothing from the other mines within the last few weeks. At the right time, when the crops are saved, it is likely the owners of the Bladen will be at work upon it. At present, little is doing.

SANTA BARBARA.

LOS PRIETOS.—Santa Barbara *Press*, July 3: Our reporter learns that all the miners engaged in the Los Prietos mines have been discharged and all work stopped. Last evening and this morning several teams arrived bringing in the workmen. Our reporter has been unable to learn the cause of this act on the part of the company, but no doubt there is good reason for it.

FROM THE MINES.—A number of men arrived last evening from the mines. They report that to-day the furnaces will be cleaned up and a fair idea can be formed of the value of the mines. Work on the road is nearly finished.

GOLD SPECIMEN.—Gold has been found on the Hill ranch, so it is said. Yesterday afternoon our reporter was shown a fine specimen of gold by Mr. Levy, the jeweler, who said that he had purchased it of a Mr. Merchant, living on the Hill ranch. The specimen is a large and beautiful one, and consists of a large quartz pebble full of seams, and on one end is attached a large piece of natural gold, which also runs through the seams. The nugget appears to be much worn, which must have been caused by water or wear in a pocket. Nothing definite can be learned where the gold was found and whether or not there are indications of a lead in the vicinity.

SONOMA.

LOCAL ITEMS.—Russian River *Flag*, July 1: The Brandt mine (Cinnabar district) has developed ore in both open cuts and tunnels, which assays from one to seven per cent. of metal. The mine is located a few miles east of Pine Flat, and has been bonded to E. Clarke (Superintendent of the Great Western) and Col. Swadley, (gold mining Superintendent of Amador county).

The Great Eastern mine (Lake district), adjoining the Great Western, is being worked by 10 men, and is developing splendid ore. About 200 tons are on the dumps.

The Mt. Jackson (Guerneville district) beat the Roaring Lion in their lawsuit this week. The ground was awarded to the former and the costs of suit to the latter.

The five retorts for the Great Eastern (Guerneville district) will be finished in about 3 weeks. There are perhaps 1000 tons of ore on the dump.

The Mt. Jackson furnace stopped work last week. It will be altered to a continuous furnace. While the alterations are in progress a bench of 3 retorts will probably be erected for reducing the high grade ore. Thirteen men are at work in the tunnels, taking out only the dirt that lies in the way. Enough good ore is now in sight to run the furnace a year.

SIERRA.

ST. LOUIS.—*Mountain Messenger*, July 3: A trip to Whisky Diggings, (Newark) last Sunday, afforded me the following items:

De Noon & Co. are going to run a tunnel into the Pilot claim No. 1, to prospect it.

The Ne Plus Ultra claim has contracted for a tunnel, 400 feet, expect to be through in three or four months.

North America has made a much larger contract for timbers this year than usual.

ENTERPRISE.—The Enterprise Quartz Co., of Poker Flat, under the management of our old friend Marchini, commenced work June 15th, and are getting along finely. They have a fine large ledge and it prospects well. Several tons have been taken below which worked from $15 to $20 per ton.

STILL SINKING.—The South Fork company are still sinking for bed-rock. They are down between thirty and forty feet.

TUOLUMNE.

MARES ANN DARROW QUARTZ CO.—Tuolumne *Independent*, July 3: The work in developing shaft No. 3 progresses steadily. The ledge gradually widens and is now nearly six feet in width. About a ton of rock, rich in sulphurets and occasionally showing fine granulated gold in fair proportion, is extracted daily. The new vertical hoisting shaft (No. 6) has again passed through quite a large seam of quartz carrying visible gold. The developments in all the shafts are such that is expected the company will be justified in erecting a couple of 20-stamp mills.

MINING PROPERTY TO BE SOLD.—The Heslep mining property, near Poverty hill, is to be sold at public auction on the 17th inst. The expected arrangements with English capitalists did not succeed. The property is believed to be very valuable and it is hoped will be purchased by those who are able to develop and work it.

ON Thursday we saw 350 ounces pure retorted gold at the express office, from the Soulsby mine. It was the yield of 250 tons of rock.

VENTURA.

ASBESTOS.—*Southern Californian*, July 3d: We have been shown by Mr. Gibson, some specimens of asbestos, pronounced a superior quality of this valuable article. It is found on the south side of the San Emedio mountains, in Ventura county. Mr. Gibson says he has traced upon the surface an immense body of it. He will soon return to give it a more thorough prospecting. He has also made some valuable discoveries of galena and silver and of gold in the same section of the country.

Nevada.

WASHOE DISTRICT.

CALEDONIA.—The new shaft is down 285 ft, the bottom in good blasting ground and the sinking progressing at the rate of 5 ft per day. This extraordinary progress, considering the size of the shaft, reflects much credit on the superintendent and foreman, especially when the great disadvantage of working under a strong flow of water is taken into consideration. Driving the drain tunnel to connect with the shaft, 120 ft below the surface, is making good progress, the face still in hard blasting rock. Sinking the main incline at the old works is being pressed with all the energy possible, the bottom in good sinking ground. It is down 365 ft below the 1000-ft station. The frame of the new hoisting works building, which is 106 ft long by 46 ft in width, is nearly covered in. This building is flanked on either side by a carpenter shop 30x80 ft, and a machine shop 40x60 ft in size.

LADY BRYAN.—Sinking the main shaft was resumed again this morning. Driving the main south drift on the 380-ft level is still prosecuted with vigor, the drift following the east clay wall of the ledge. The west cross-cut on this level is in a distance of 105 ft, the face in quartz of a whitish blue character, much resembling the low grade ores of the Comstock. The main south drift on the 250-ft level is also making good headway, running in the east edge of the ore vein. On the 180-ft level the east crosscut from the south drift has developed a fine body of milling ore 35 ft in width, with a small streak of poor ore 8 or 10 ft running through it. The hight and length of this body of ore has not been determined, but there is little doubt that it is simply a continuation of the body found in the west cross-cut from the south drift on the 70-ft level, at which point it was only 16 ft wide, and although milling ore, was not of so good a quality as that developed on the level below.

CONSOLIDATED VIRGINIA.—Daily yield, 600 tons of ore. The ore stopes and breasts are all looking splendidly throughout the mine, and promise to keep up their present yield for months to come. The yield so far the past month has been amply sufficient to insure a return of $1,500,000, and the payment of the regular $10 dividend. There is little of renewed interest in regard to the prospecting operations, as no new levels are being opened, and the old ones are so thoroughly penetrated by cross drifts and winzes that there is no expectation of any new or important developments for some time to come. Sinking the C. & C. shaft is making rapid progress, the erection of the new hoisting works is advancing rapidly, the mills are all running steadily, and everything looks bright and prosperous.

BEST ANN BELCHER.—The connection of the south drift on the 1700-ft level with the north drift from the Gould & Curry, was completed day before yesterday, giving a much needed supply of pure air, cooling off the level and affording great relief to the workmen.

CHOLLAR-POTOSI.—Sinking the new combination shaft is making good headway, considering the large amount of excavation necessary. It is down 50 ft, the bottom in excellent blasting ground. Sinking the main incline at the old shaft is progressing downward at the rate of 2 ft per day. The two main south drifts on the 1250 and 1150-ft levels are still driven vigorously ahead, the face of both in porphyry. Daily yield, 60 tons of ore, the assay value of which is $31 per ton.

OPHIR.—Daily yield, 220 tons of ore. This ore is being mostly extracted from the 1465-ft level. Opening out the incline station at the 1565-ft level is making steady and favorable progress.

BELCHER.—Daily yield 500 tons of ore. The yield of the ore breasts are unchanged, and the quality of ore extracted is fully up to usual standard. The yield of bullion for the month of June will be fully as good as that of May. The air shaft is completed to the 1300-ft level and is vastly aiding the development of the lower levels of the mine. Opening out the 1600-ft level is making good progress. The extraction of ore from the 1500-ft level has been commenced. The mills are all running, and the future prospects look favorable and bright.

CALIFORNIA.—This mine has been so thoroughly cross-cut and prospected on the 1500-ft level that the operations are now almost entirely confined to cross-cuts 4, 5 and 6, the face of each of these drifts being in rich ore. The face of the lateral drift running in the vein to connect cross-cuts Nos. 4 and 5 is also in fine ore.

YELLOW JACKET.—The pumps are still kept steadily running by the flow of water from the 1840-ft level. Sinking the north and south winzes below the 1740 ft level is making rapid headway.

SAVAGE.—Sinking the main incline is being pressed with all the vigor possible, the rock in

the bottom being a little tough, but blasting out well.

UTAH.—The new machinery is working well and the shaft will soon be drained of water, so that sinking tho shaft and prospecting the lower levels of the mine can be resumed with every assurance of future success.

SIERRA NEVADA.—At the 700-ft level of the old shaft, the drifts both north and south are still driven vigorously ahead, with but little material change in the character of the rock penetrated.

CROWN POINT.—Daily yield 550 tons of ore. No change in any of the ore producing sections of the mine. Driving the main east drift on the 1700-ft level is making fair headway, but has not yet reached the point at which it is expected to reach the ledge.

HALE & NORCROSS.—The main incline is down sixty-eight feet below the 2200-ft level, the bottom in fair ground, and the sinking making good progress.

GOULD & CURRY.—Everything is in good running order, and the water is being rapidly lowered in the shaft. The air connection on the 1700-ft level has been completed with the Best & Belcher, and cross-cutting and prospecting that level will now be the order of the day.

JULIA.—Sinking the main shaft is being pushed ahead with all the vigor possible, the rock in the bottom blasting out finely, and the Burleigh drills doing splendid execution. It is now down 380 ft below the 1000-ft level.

OVERMAN.—The water is drained from the shaft to a point 40 ft below the 1000-ft station, where it is held by the pumps. The necessary water tanks, pump hobs, etc., are being put in at both the 700 and 1000 ft stations.

EUROPA.—The new hoisting machinery was started day before yesterday, everything working with the utmost nicety and perfection.

LEO.—Good progress continues to be made in sinking the winze below the main tunnel level. It has to-day reached a depth of 143 ft, and the ledge matter looks more and more promising.

JUSTICE.—The north drift at the 800-ft level is progressing very well, showing excellent ore indications in its face.

COSMOPOLITAN.—The ore during the week has assayed very well indeed, both in the stopes and in the main drift, which is being extended northward, following the vein.

IMPERIAL-EMPIRE.—Every effort is being made to complete the connection of the upraise from the 2000-ft level and the winze from the level above, at the very earliest moment possible. The heat in the up-raise is simply terrific, it being almost an impossibility for the men to work even for a few minutes' time.

WOONVILLE CONSOLIDATED.—The shaft has passed through the ore vein, which, at that point, is nearly 50 ft in width, with nearly 30 ft of quartz and ore.

SUCCOR.—Driving the north and west drifts, on the 550-ft level, is being prosecuted with all the energy possible, with steadily increasing indications of finding pay ore in the west drift.

NIAGARA.—The new steam hoisting works will be ready to steam up by to-morrow morning. As soon as the machinery has been given a fair trial, sinking the incline will be resumed, when some excellent results may be looked for.

ORIGINAL GOLD HILL.—The ore body developed by the two southermost cross-cuts from the main south drifts, continues to improve in both quality and extent as further developed.

TROY CONSOLIDATED.—Sinking the shaft is making fine headway, the bottom in the same excellent and promising ledge matter, with spots of rich ore, mentioned in last week's report. Some of these bunches assay high in the hundreds, showing rich in black sulphurets of silver, with some gold. A valuable little bonanza might be developed here at most any time.

AMAZON.—Steam hoisting works have been contracted for, and it is expected will be on the ground ready for erection in four or five days more.

MINT.—The shaft is down 715 ft, the bottom in vein matter of a very favorable character, affording low assays. The sinking is making excellent progress.

DANEY.—The work of putting in the new boilers and machinery is making rapid headway, and everything will be in readiness to again resume sinking.

DAYTON.—The foundations are completed, and the new machinery is being placed in position as rapidly as it is possible for it to be accomplished.

CHERRY CREEK DISTRICT.

STRUCK IT.—White Pine *News*, July 1: On the 14th ult., the Star mine, at Cherry creek, struck a large body of ore in their new shaft, at a depth of 290 feet. The strike was made in the new double shaft which is being sunk west of the old workings.

CORNUCOPIA DISTRICT.

Elko *Independent*, July 1: The Leopard mill and mining company, of Cornucopia, not having sufficient milling capacity to meet its demands, has purchased of the Mineral Hill mines company the magnificent 20-stamp mill erected by the latter at Mineral Hill at a cost of $140,000, which will at once be taken down and moved to Cornucopia. This is a splendid mill, has never been used but little, and is as good as new. The price paid for the mill as it now stands was only $17,500, but by the time it is torn down, moved to its destination and put in running order, it is expected to cost the company $50,000. The machinery is expected to be ready to run in about 90 days, and then the bullion will commence to flow in large quantities from the "Horn." A large number of mines in that district have ore on their dumps, and only wait for a chance to mill it, which will probably be afforded them this fall, as we have been informed that as soon as the new mill is in operation the Leopard company will be prepared to do all the custom work that comes to it.

ELY DISTRICT.

THE CAMP.—Pioche *Record*, July 4: The hopes and expectations of many in relation to the future of our camp are in a fair way to be more than realized. The encouraging aspect of things in general may be taken as a fair exponent of the present favorable indications, and serve as a guarantee of future prosperity. During the month of June, Wells, Fargo & Co., alone have shipped $145,000 worth of bullion, and the aggregate of the present month will make a still better showing. Professor Stewart, in his prolonged visit, expressed his decided conviction of the existence of a belt of ore of no common magnitude.

RAYMOND & ELY.—The western ground is still being developed with about the same success as heretofore. The winzes being sunk in the 8th and 9th levels are going down very satisfactorily. Winze No. 4 on the 8th level is now about 32 feet in depth. Winze No. 1 on the 9th level east is down 122 feet; No. 2, on the same level west, 116 feet. There is a slight increase in the amount of ore being raised; it has averaged about 60 tons during the past week. The ore continues of the same grade and quality. The pump is doing its work well, and the work of sinking progresses uninterruptedly. Receipts for June, $98,368.58.

MEANOW VALLEY.—Are still running an east drift from No. 3, on the 1200-ft level. Work is also continued on the drift running from No. 5 to connect with the east drift. The usual quantity of ore is being extracted. The 170 tons of rock crushed at the Condor mill yielded $23.443 in bullion. This rock showed a marked increase in gold, which indicates that as the water level is approached the rock carries more gold.

NEWARK MILL.—This mill has been doing some pretty good work for the month of June, having worked 170 tons for the Meadow Valley mine, working $24,000, or $141 per ton, and 30 tons for the Alps, working $5,600, or $186.12½ per ton—a pretty fair showing both for the mill and mines.

ALPS.—The Alps mine is being worked as usual; the men being principally employed extracting ore, which is taken to Newark mill as soon as a sufficient quantity is on hand to be worked. The ore works, on an average, nearly $200 per ton.

WHITE PINE DISTRICT.

SMELTING COMPANY.—White Pine *News*, July 3: It is with great pleasure that we are able to chronicle the fact that our citizens are really about to incorporate a joint-stock smelting company, and that the work is progressing as rapidly as possible. It is astonishing that this matter has been delayed so long, where all the necessary appliances for successful smelting are so easily attainable in this district. Had the same energy and enterprise been display d two years ago, that now characterize our people, White Pine would to-day be second to no other mining center in the State. However, there is some excuse for this listlessness on the part of our citizens, who have from year to year been led to believe that outside parties intended to start smelting works in this district, and, as a consequence, did not deem it necessary for them to act in the matter. They now fully realize that it is necessary for them to take the matter into their own hands, and we feel positive in stating that the necessary amount of capital will be raised to put the Mattison smelting works in operation in the next 60 days, and that the new company will shortly thereafter inaugurate a healthy and lucrative state of affairs in the mining business of this locality. In our next issue we hope to be able to state that the nececessary amount of capital has been subscribed, and that the affairs of the "Hamilton mining and smelting company" are in successful operation.

SIERRA DISTRICT.

RICH DISCOVERY.—*Silver State*, June 23d: Some time since Thomas Comins, who has been engaged in mining on the eastern slops of the East range, about twenty miles south of town, accidentally discovered that a hill, over which he had traveled time and again, contained a large quartz lead in which gold was visible to the naked eye. The discovery of gold in the rock led him to examine the situation carefully, and, when satisfied that a rich ledge existed in the hill, he secured 1500 ft of it by location, naming it the "Goodrich." He had a sample of the ore assayed at the Humboldt reduction works, which contained $627 in gold and $13 in silver per ton. He then imparted the secret of the discovery to some friends here, who sent a man to look at the prospect. He reported favorably, and they located an extension on one end of the original claim, while a like claim at the other end was reserved for Joseph Ginacca. Mr. Ginacca took a look at the discovery a few days ago, and considers it one of the most valuable prospects found in this part of the State. He says there is an immense vein of quartz in the hill, the extent of which is not yet known, and that if it pays ten or twelve dollars a ton in gold, it can be profitably worked. We were shown some specimens of the rock by P. W. Johnson last evening, in all of which gold is visible to the naked eye. In addition to the gold, the quartz carries a brownish ore, apparently oxidized iron sulphurets, in which there is more or less silver. A wagon load of the rock, right off the croppings, is now at the reduction works, and if it pays $20 a ton, a lively camp will spring up at the mine immediately, as there are parties interested who can command capital to build mills. It is somewhat remarkable that this quartz ledge, which is said to be thirty feet wide, and in which gold can readily be seen, should have escaped the notice of the many prospectors who have repeatedly traveled over it, and that the discovery of gold, which now brings it into notice, should be the result of accident.

Colorado.

BULLION.—Georgetown *Miner*, July 3: The shipments of bullion from the Judd & Crosby reduction works for the week ending July 3, amounted to $8,141; and the shipments during the same time from the Stewart silver reducing company were $5,064.

VICTOR.—A new ore body was struck in this mine this week, which assays about 2,500 ounces silver per ton.

PAY ROCK.—The Pay Rock Consolidated mining Co. is now building a road from the Diver road to connect with their mine, which will cost $250. They will soon have in place an engine for hoisting and pumping. The company employs sixty-five miners; first-class ore runs high grade as usual; and there are now 200 tons third-class ore on the dump, ready for concentration as soon as Teal & Eddy are prepared to commence work.

FOUND AT LAST.—Boulder *News*, July 1: Years ago, in the flush times at Ward, Cy. Deardoff found what was supposed to be a lode, that, however, proved to be only a slide. It was wonderfully rich, but was soon worked out. Year after year since then prospectors have dug and hunted for the lode, but have never found it. Occasionally a pocket on the slide would be found where the dirt was so rich it would be sluiced out with good results. This year, like others, the ever hopeful prospector worked to find the lode, and worked at last successfully. One day Cy. Deardoff and Jim Sivits found the lost lode, and dug down onto the crevice. Sivits sold to Jo. Long, and now Deardoff & Long are busily at work taking out an abundance of rich quartz from a strong and unmistakable crevice. We are told that the ore prospects wonderfully rich.

NEW MINES IN GRAND COUNTY.—Late last fall Jas. Bourn and Alexander Campbell discovered rich float ore on the Rabbit-ear range, in Middle Park, about 70 miles west of Georgetown, and after diligently prospecting the country, struck several lodes. The approach of winter caused a cessation of developments, but as soon as the snow disappeared this spring, the boys started to work again. They have now found eight good mines, nearly all showing ore from the grass roots. One, the Silent Friend, in a shaft eleven feet deep, displays a continuous seam of mineral which assays 1140 oz. silver per ton, and will mill at least 700 oz. The ore is a gray honey-combed sulphuret, carrying silver glance, and deeply stained with carbonate of copper. Another vein yields from a 14-inch mineral body, ore running 150 oz. silver and 60 per cent. lead per ton. The specimens of light ore which we have examined, resembled the product of the Belmont mine in East Argentine, and that of the Comstock of Nevada. It is easily reduced, and held in high favor among our mill men. Messrs. Bourn and Campbell are working a force of ten men and piling up large amounts of ore, which they will soon haul over to Georgetown.

PARK COUNTY ITEMS.—A special telegram from Fairplay announces the discovery of rich placer diggings near the head of Pennsylvania gulch, about three miles from Fairplay. The dirt is said to average 50c to the pan, and several nuggets have been found. A good deal of excitement prevails and the usual rush of miners is making for the scene of the strike.

The placer miners at Hamilton are meeting with unusual good success. An immense amount of ore has been delivered to the smelting works during the week.

We are informed that the foundation will be laid, in a few days, for extensive chlorination works, and that the parties intend having them in operation in the shortest possible space of time.

Idaho.

IDA ELLMORE.—Owyhee *Avalanche*, July 2: The work below is confined principally to the eleventh, twelfth and thirteenth levels. The two former levels are being opened up, and a winze is in progress from the twelfth to the thirteenth. When the mine was in the hight of its prosperity, years ago, the rich ore, the taking out of which had such a marked influence on the condition of affairs in this camp, came from the third level and above. Having been exhausted in that direction, there is a well-founded belief that a continuation of the same rich vein exists somewhere in the vicinity.

GOLDEN CHARIOT.—A letter of the 3d says: In the 4th Minnesota level a fine body of ore has been struck, sixnate close to the shaft. The stopes about the 5th Chariot level are looking splendid. In the 2d level the drift north is still in a vein of ore, and in the winze, which is down to 40 feet, the ledge continues strong.

PAUPER.—A letter of the 1st says: The stopes are looking fine and ore that is immensely rich being extracted.

ILLINOIS CENTRAL.—On the 3d, the ledge in the 4th level was cut; the ore is rich and the vein about 15 inches wide. The winze from the 3d to the 4th level is of the same quality of ore—heavy black sulphurets.

Oregon.

THE VIRTUE MINE.—Owyhee *Avalanche*, June 24: This mine is situated near Baker City, Oregon, and is at present attracting considerable attention both at home and abroad. The ore is entirely of a gold bearing character, the bullion being 940 fine and worth $19.50 per ounce. The company have a magnificent 10-stamp mill in close proximity to the mine. The ore is run from the mine directly into the mill, which does away with the expense of hauling. Mike Hyde, formerly of Fairview, is superintendent of the Virtue. He is a gentleman of extensive practical experience in quartz mining, and we predict that he will have the Virtue on the list of dividend-paying mines as soon as he gets it in proper shape for yielding ore. Mr. Hyde passed through here on his way home from San Francisco a couple of days ago, and informed us that he has a new and complete set of heavy hoisting machinery on the way. He shipped it from San Francisco to Portland and thence up the Columbia to Umatilla, from which place it is being brought up by teams to Baker City. By that route, the freight from San Francisco to Baker City is only 4¼ cents per pound. As soon as the new hoisting works are ready for operation, the sinking of a new shaft will be commenced 500 ft east of the ledge on the surface, which will tap it at a depth of 1500 ft. The ore taken out of shaft, winzes and drifts, without any stoping, very nearly paid the expenses of working the mine during the past winter. The chute of pay ore is known to extend at least 1200 ft along the ledge, and when it is properly opened and stoping commenced, big bullion shipments are expected. The mine is splendidly situated for working. Living is cheap, and wood only costs $5 per cord delivered at the mill and mine.

Utah.

DRY CANON MINES.—Cor. Salt Lake *Tribune*: Mining enterprises are slowly but steadily advancing throughout this camp with rumors of a big sale. A half interest in the Queen of the Hills and Flavilla mine was sold during the past week, by Col. J. W. Johnson, to the Chicago silver mining and smelting company. Report says the sum paid was $350,000 in cash. This mine never looked as well as at the present time. The main incline is now at a depth of 750 feet, with seven feet of clear ore in the face, while the switch incline has reached 825 feet depth, with five feet of clear ore in the face. Cross cuts near the bottom show a continuous and true vein, with ore increasing rather than diminishing in volume. Within one year there has been over 3000 feet of work, and over 5000 tons of ore extracted from this mine prospect. The past week twenty tons of ore daily has been shipped, and the company will ship thirty tons daily during the present. The Hidden Treasure shipped forty tons daily during the past week, and intend increasing to fifty tons per day this week. The Emporia has about sixty tons ready for shipment this week. Numbers of companies, mines and prospects will start up as soon as the Mono gets under way.

General News Items.

JOHN MILLER, Secretary of the Western Development company, an adjunct of the C. P. R. R., who was arrested some days since for embezzlement, turns out to be a most precious scoundrel. Besides having stolen the funds of the company, he appears to have lived in this State for the past six years under an assumed name, his right name being Woodruff, and although having a wife and family in the East, he had married an estimable lady in Sacramento and been living in princely style in this city.

IN the case of Patrick Lenehan, who was killed by the premature discharge of a cannon at the dock of the P. M S. S. Co. last week, the coroner's jury have found that the officer in charge of the firing is censurable for negligence, and that the company is blamable for employing inexperienced men to handle the guns.

GEORGE WALKER, 22 years of age, shot himself in a lodging house in Oakland Tuesday evening. No friends and tired of life the excuse.

DURING the celebration at West Unity, Ohio, on the 5th inst., Peter Krindle was killed by the premature discharge of a cannon.

THE assistant light house keeper at Point Concepcion light was drowned, last Tuesday morning.

OF course the Beecher jury disagreed. They are reported to have stood nine for Beecher, three for Tilton.

TIM FLORENCE, an ex-member of Congress from Pennsylvania, died in Washington last week.

THERE were three suicides in this city on the 5th inst.

A NEW APPLICATION OF TELEGRAPHY ON RAILWAYS.—An English journal says: "A decidedly novel invention has been suggested during the last few days. It is to affix lamps to the telegraphs by the side of the railways, and enable the telegraph clerks at the nearest station to light them by electricity whenever there is danger on the line, the idea being that as soon as the driver of a train saw these lights burning he would bring his engine to a standstill, and remain standing until he received instructions to proceed."

Gold and Silver in Contra Costa County.

What further discoveries the finding of rock containing gold and silver at Lafayette may lead to we cannot tell; but already it seems to have been ascertained that nearly all the sedimentary rock formations of that neighborhood contain more or less of these metals. The first discovery a few weeks since was made in testing rock found by Mr. William Boardman, in sinking a well for domestic use. From the reddish color, he feared the rock might contain quicksilver, that would render it unsafe to use the water. To determine this matter an assay of the rock was obtained, and it was found to contain a trace of quicksilver, and gold to the value of about $14, and silver to the value of something more than $3 per ton. Further assays have been made in sinking the well shaft, which is now down some thirty feet, with about the same result. In the meanwhile surface inspection of the rock strata of the vicinity has pretty clearly defined their direction, pitch, thickness and general varieties. It is all of the sedimentary, metamorphic character common throughout this range of country, much of it of soft, granular, sandstone composition, and only partaking of crystalline structure where it has been highly heated. Rock of similar character and appearance to that found in the well shaft, taken from the surface croppings in various places about the neighborhood, has assayed from $9 to $13 per ton. From outcrop rock on the place of Mr. Nathaniel Jones, two miles from the well shaft, he has had an assay of $9.34 per ton. Small particles of free gold have repeatedly been found in the rock from various outcrops in the vicinity, but none of it partaking of the character of vein formation.

The theory upon which the presence of gold and silver in this sedimentary rock is accounted for, is, that the sediment was composed in part of the detritus of gold and silver bearing veins very finely reduced by attrition. Upon this theory, which does not seem unreasonable, we do not see why we may not find gold and silver in any or all the recent sedimentary formations, and the question will then be, how much of these metals must there be in the rock to pay for working it? As this question relates to rock in which the gold and silver is found about Lafayette, we are assured by experts that the cost of crushing and extracting would not exceed $3 to $5 per ton. If that is all, $17, or even $9 rock will pay well enough, if enough of it is to be had, of which there seems a great probability. Then, too, we are assured that a piece from a float fragment of rock, found in a creek bed near Lafayette, where there are other fragments of similar appearance, has assayed as high as $206.48 of silver to the ton. The source of these float fragments has not been found, but is supposed to be somewhere in the vicinity. There is no great degree of excitement about these recent and quite unlooked for discoveries, the verity of which cannot be doubted, since they are vouched for by numbers of old, well known and reliable citizens, cognizant of all they attest to; but there is certainly fair reason to believe that gold and silver mining may soon become one of our leading productive industries.—*Contra Costa Gazette.*

Gold in Ancient Architecture.

Mr. F. A. Skidmore recently gave a lecture at the Royal Architectural Museum, London, "On the Use of Gold in Ancient Architectural Enrichment, and its Influence on Conventional Forms." The lecturer observed that vast sums of money were being spent now-a-days on architecture, and architects took credit for accomplishing great things when they were simply working on the past in copying what they found in existence. This should not be. Architects should be constructors in the true sense of the term, or else go further back, and reproduce what was done by workers in gold. It was not at all uncommon in ancient times to use as much as ten owt. of gold in adorning temples, and at that period the goldsmith occupied a very high position. In decorative stonework there was often a marked difference, and this arose from the peculiarities of form taken by the metal when beaten. The stoneworkers had followed upon the ancient goldsmiths, and had simply copied the forms of decorations in gold and silver which they found in existence. He urged that this eternal copying was a great mistake; architecture at the present day was a failure, and that simply because it resolved itself, with architects, into a question of various old styles. They showed nothing of the constructiveness which science taught was necessary for true progress, and hence was what he regarded as a failure. He contended that architects ought not to stop at stone representation. If they were determined to rely upon and worship the past, they should go as far back as the goldsmith's period, and then they would understand why many of these stone representations took a particular shape. If they would reproduce the past, let them do it honestly and fairly. Go back far enough, and resuscitate the trade of the decorator in gold. There was no legitimate ground for halting where they now stood, as they were simply like imperfect translators, who had no thought of original work, or of going even to the root of the thing they had in hand.

A VETERAN carriage builder says that, although his clerks are very talkative during the day, they are always ready to shut up at night.

Palace Cars for the Central Pacific Railroad.

A recent number of the Dayton (O.) *Journal*, gives a detailed description of drawing room and palace cars, which are being built by the Barney & Smith manufacturing company, for the Central Pacific railroad company. The *Journal* says: "The general shape of the drawing room cars is similar to the standard Pullman, many of which have been built by the B. & S. Co. within the past ten years. Their color is a light shade of canary, with light tracings, and scroll work of darker and contrasting shades. The interior is finished in black American walnut, oiled, and most elaborate veneering of French walnut, engraved with fine lines of gold, and decorated with shields of unique marquetry, containing the monogram of the railway company in ivory on ebony. The silver lamps, with shaded glass globes, highly finished wood, elaborated with silver fixtures, in shape of curtain rods, coat and hat pins, and the embossed French plate glass and mirrors, give almost a dazzling tone to the entire coach. The seats, chairs, and sofas are upholstered with the finest grade of Cerise plush. The floor is covered with Brussels carpet, made expressly in colors and design to harmonize with the general finish. The windows are shaded with damask curtains, on spring rollers, which also, in color and figure, carry out the completeness of the interior finish. The berths are equipped with spring and hair mattresses, of the very best quality, linen sheets, pillow cases, etc.; in fact, every necessity and luxury possible to imagine.

"The body of the coach contains a smoking room, with an inlaid floor, supplied with a sofa and lounging chairs. The room is entirely disconnected from the main room, yet easy of access by means of a short passage which leads into the sleeping or parlor portion of the car. This room is divided into twelve sections, each section supplied with four seats, or two berths, two double sash windows, damask shades, and embossed mirrors. Each of these compartments is so arranged that it may be entirely closed from the others, and by the addition of a movable table, converted into a dining room.

"Next to the smoking room there is a larger and entirely private state room, supplied with arm chairs and a sofa, together with a ladies' dressing room, complete in each detail. At the opposite end of the car is the general wash room, closet, and steam heating arrangement, all finished with corresponding elegance.

"The drawing room day coaches for the Southern Pacific are of the same general appearance outside as the above, but are finished inside with an artistic combination of mahogany and rosewood, engraved with tracings in gold of leaves and flowers. These woods are so highly finished, and so handsomely carved, that they form a unique work of art. Revolving fauteuils, upholstered with crimson velvet, placed before French plate-glass windows, 5x3½ feet, form the seating arrangements.

Cornucopia District.

A correspondent of the *Silver State* says: Since my last, the influx to this place has ceased a little, and it is well for all that it should be so. Rome was not built in a day, nor do men get rich in that short length of time. After careful examination and close inquiry from the best sources, I am fully of the belief that this will in time make one of the

First Mining Camps in the State,

But it will take time for development. There are many good mines located and to some extent developed, and all show as far as worked good milling ore. The Leopard is an exceedingly fine mine. Late workings on it show such prospects that the company have come to the conclusion that they are warranted in putting up immediately a new

Twenty-Stamp Mill,

Which they are proceeding to do. This will give employment to some more of the idle men that are around here now. The Hussey mine is located near the Leopard, at the south end of town, and bids fair to be a valuable property. The Black Diamond mine, owned by A. D. Meacham and others, is highly spoken of, and will, undoubtedly, in a short time create quite a stir here as one of the rich bonanzas of the place.

The town is

Growing Quite Rapidly,

Sometimes I think almost too fast for the amount of business that is done here. In town there are four stores, seven saloons (with two under way), three restaurants and one lodging house, two butcher shops and one bakery, also there is quite an extensive adobe yard, with plenty of adobes on hand, which sell for twelve dollars per thousand.

The Leopard Mill Started

Up again, and will continue to run steadily if no accident occurs. There are two blacksmith shops here now—one is run by a Chinaman. Johnny Barrett, of your place, arrived here the other day with his outfit, and is now busily engaged in putting up his blacksmith and wagon shop.

TO TAKE OBSERVATIONS DURING A FOG.—A correspondent of the *Scientific American* suggests that observations might be taken from a captive balloon allowed to ascend above the strata of a dense fog.

A Peruvian Mining Centre.

Probably few of our readers have ever heard of the city of Pasco, high up among the Andes of Peru, but it is a place of no little mercantile importance, with 30,000 inhabitants, full of English and other European commercial houses, including among them discount and other banks. There are also several magnificent hotels and other houses of entertainment. Among its extensive treasures of copper, silver and gold, there are in the vicinity of Pasco 200 silver mines, in actual working, and there are nearly 1,700 mines of all sorts, permission to work which has been granted by the government to natives and foreigners, the proportion of metal being from 10 and 15 to 3,000 lbs. in a block of 50 cwt. It has been calculated that the mines of Pasco have produced 160,000,000 oz. of silver, being double, or more than double, all that the rest of Peru has produced during seventy-six years. The hill of Pasco is intersected with veins of pure silver, sulphides of silver and copper, carbonate of copper, and silver pyrites; and besides the 2,000 mines, there are 1,300 places where the gold cropped out. Its gold mines, which in 1805–10 yielded to the Spanish government about five millions of dollars, are now no longer worked, because the miners confine their labors to the silver. The hill of Pasco might become a great centre for a mining colony, and maintain 300,000 laborers with a tenth of the produce of the valley of Jauja. The mineral hills of Santa Rosa, Lauricocha, and Yauacsucha, with the forty little hills which surround them, all having the same geological formation, and united by the local railway, have 290 mines in working, and are intersected with iron pyrites and other minerals, which, when smelted, produce valuable metals, from bright, shining silver to sulphides of copper. The gold ores found in the hills of this district have always produced from two to four pounds of gold in a block of 5,000 lbs.

Why Arcs or Ellipses of Circles Please the Eye.

Prof. Muller, in a course of lectures in Berlin, offered a simple and mechanical explanation of the universal admiration bestowed on these curves. The eye is moved in its socket by six muscles, of which four are respectively employed to raise, depress, turn to the right and to the left. The other two have an action contrary to one another, and roll the eye on its axis, or from the outside downward, and inside upward. On the object being presented to the eye for inspection, the first act is that of circumvision, or going round the boundary lines, so as to bring consecutively every individual portion of the circumference upon the most delicate and sensitive portion of the retina. Now, if figures, bounded by straight lines, be presented for inspection, it is obvious that but two of these muscles can be called into action; and it is equally evident, that, in curves of a circle or ellipse, all must alternately be brought into action. The effect then is, that if two only be employed, as in rectilinear figures, those two have an undue share of labor; and by repeating the experiment frequently, as we do in childhood, the notion of tedium is instilled, and we form gradually a distaste for straight lines, and are led to prefer those curves which supply a more general and equable share of work to the muscles.

BESSEMER STEEL WORKS.—There are at the present time ten bessemer steel works in the United States—five of which are in Pennsylvania. In Sweden there are fifteen in operation. We have no data at hand for giving their numbers in other European countries; but the process is coming rapidly into use all over the civilized world, and bids fair to soon introduce steel into almost universal use for all purposes for which wrought iron is now employed. Thirteen years ago a shrewd Yankee partner of E. B. Ward, of Detroit, travelled over Europe, visiting all the steel works, in order to get an insight into the manner of making steel by the Bessemer process. In Norway and England it was difficult to get an inkling of the subject, so jealous were the manufacturers. But at the great Bessemer works on the Isle river, in the South of France, through the courtesy of its managers, he saw it all and became master of the subject. To-day it is likely to become the leading manufacture of America.

THE contract for furnishing the gas fixtures for the Palace Hotel has been awarded to Thos. Day & Co., of this city. The dining-rooms will be lighted by twenty-four light chandeliers. Each of the 755 sleeping rooms will be furnished with a five-light chandelier with center light extension arm. The office will have four twenty-four light chandeliers, one each in the ladies' and gents' reception rooms, reading room and bar room, and two in the ball room. On each of the marble mantles will be two standard lights, making 1,408 in the hotel. The bath and wash rooms will require 1,800 brackets. Around the balconies in the inner court will be 108 standard lights, with three and five-light clusters. At the entrance to the court will be rich brass bracket lamps, with coach lantern beveled edge glass.

IRON FOR PURIFYING WATER.—In relation to the value of iron for purifying water it is remarked that in 1857 Medlock took out a patent in England for the use of iron for removing all impurities from water. This method has been largely discussed, experimented upon, modified, criticised, and finally, we believe, generally abandoned and now revived again.

Iron in Architectural Structure.

In modern ordinary construction, the introduction of iron, more particularly as iron columns, is an every day characteristic. The tendency from the interior class of the materials used in many buildings, is to make the iron portion as light as possible, and sustain as immense a superstructure of stone or brick, and in some instances of wood, as a few slender pillars can be forced to support. It is not remarkable that when a fire occurs in such overloaded structures, the quantity of combustible material in the building brings about to almost a certainty the entire destruction of all parts of the building indiscriminately. What under most circumstances would be almost indestructible, becomes under numerous conditions the cause of more extended destruction than if the whole had been of less composite arrangement.

Few iron columns, when sound, of proper thickness and strength, and standing well on their feet, can ever be overloaded to a crushing degree by the weight of the mere front that is carried up over them. Nevertheless, it is in such situations that iron pillars are exposed to the greatest stress. It is the experience of all firemen in cities that when a fire in a building once becomes uncontrollable, the quicker the building burns or falls down, provided no life is lost, so much the better.

If an architect is left to the selection and disposition of the materials that are to enter into the building that he superintends, there is little to fear as to any dispsragement that the use of iron as a building material can offer; it is where a limit is placed upon his action that the incongruity of the materials and the unequal strength of the various parts, instantly manifest to the practiced eye that but little would be required to consummate the destruction of the fabric. It is admitted that a column that is abundantly strong when cold, will, when heated to a red heat, yield to its superincumbent weight. Such instances are, however, far less frequent than where a column of limestone or sandstone, and even granite, when subjected to a similar exposure, behaves in a very much worse manner. Iron may melt or crack when played upon, but how seldom it is that an iron front is rendered incapable of repair and future use, while nothing would be left of stone columns but dust, slabs and spalls. There is no defect in the application of iron that cannot be either remedied or partially obviated.

The foregoing thoughts were induced by observing that in an Eastern town a patent has been secured for an iron column that is in reality a column within a column. The invention consists in applying the principle of the fire-proof safe to an iron column. As in the case of the common iron pillar, solid cast iron columns sustain the whole weight of the superstructure, but outside of each solid column is a thin cast iron shell, and the space intervening between the outer shell and the inner column is filled with plaster of paris, the non-conducting properties of which are well known. No weight is allowed to rest on the outer shell, or the non-conductor that is used as filling, their only mission being to protect from the effect of heat the real support of the building, the inner column. These columns will be surmounted by an iron T girder, which is enclosed in a fire-proof casting of a similar nature, and the junction between the pillar and the girder is so formed that only the protected portion of the one touches the protected portion of the other, while the casing forms a tight joint, making the fire-proof armor complete. These columns are intended to take the place of the ordinary iron columns in ornamental fronts of buildings, as well as the interior of large warehouses where such supports are needed.

To a certain extent the outside sheathing might be as well galvanized iron as cast, it being adequate to all the requirements of the cast shell.—*Metals and Arts.*

Quicksilver in Arizona.

The Arizona *Miner* says: Everybody about town will recollect that three or four weeks ago there was a little stir on account of some cinnabar ore that was brought in by some prospectors. Numerous tests were made and quicksilver found in all the rock. Mr. John Malcomb and Joe Stone arrived in town Tuesday, having been out to make locations. They brought in about twenty pounds of ore, which can be seen in the cabinet at Thorne & Hutchison's saloon, and in the hands of Capt. J. P. Hargrave, also with H. A. Bigelow, at the Nifty saloon. The lode is situated on the Verde river, which it crosses several miles below Squaw peak, and shows for a long distance on both sides of the stream. Malcomb and Stone report that there are large holes excavated along the vein, evidently by Indians, who used the ore for paint. The ore is identical in appearance with the pieces which have been found in the old Indian camps for years past in Yavapai county. J. C. Clancy, who was killed May 10th, at the Crook mine, was the discoverer of the lode, and in the location just made his interest has been preserved. The other fortunate locators are John Malcomb, Wm. Kent, Dan Cannon, J. P. Hargrave, John A. Rush, H. A. Bigelow, P. S. Babcock, Pat. Hamilton, Pete Reed, E. S. Penwell and Eli Fender. Now we need a man that understands working cinnabar ores to take hold in earnest.

Good Health.

Milk Diet in Typhoid Fever.

Dr. L. R. Rogers, of Albany, esnde to the *Medical Record* the following account of his management of a severs caee of typhoid fever on the milk diet principls:

Tha point to which I wieh to call sttention is the dist part of the treatment. Ae soon as I felt snre that ahe was goiag to have a regular "run" of fever, I commenoed to give milk--fresh, raw, oow's milk, from one oow, and not more than twelve honrs old at any time. I gave, dnring the hight of the disease, from one and one-half to two qnarts per day; overy hour at first, then every half hour, and tor over two weeks every quarter honr, without any water or other food, except a few times when I tried beef tea and other dietary preparations. Tne latter in every instance raised her pulse and fever, and thickened the fur on her tongue. Her bowels gave no trouble, moving by injeotions ouce in four or five days, the dejections like thoee of an infant. Qninine and stimulants made her worse every time when tried, and the severe pain in back and limbs, which came on every day about eix P. M., was qnieted in ten or fifteen minutes by a mild ourrent of Faradio electricity from the back of the neck to the sacrum of the feet, which was continued twonty or thirty minntes.

Thie trestmeat I need for thirty-two oonsec. utive days, giving each time a good night's rest, free from pain, without snything in the shape of opiates. I had the best counsel the oonnty afforded, and the oase was oonsidered hy all who saw it one of the most severe.

Small doses of the sulphite of soda were all the medicine she took that did not disagree, and I gave this simply to prevent decomposition in the milk.

There were many fatal oases in the epidemio, hut all who bore milk well recovered. In thie caee, although ehe had the nouriehment in one and one-half to two quarts of the beet milk, ehe continued to get weaker and weaker for over four weeke, which shows very plainly that any other diet would have failed to meet the emergenoy.

Milk oontains all that is needed to nonrieh and keep up every part of the eyetem, nearly, and is always the same; while our best dietary mixtnres are wanting in many things needed by the economy, and cannot be made twice alike. I have since that time used milk very freely in all stages of various diseases, and have had reason to be well satisfied with it as the best diet for both adults and children.

I do not put forth thie oase as one to copy from in the particular treatment, bnt simply to show that the best artiole of diet that the wo ld conteins, either in disease or in convalescence, and one always obtainable, is too often neglected, and complex dietary compounds used instead. The patient in this instance was confined to the house over eight weeks, and made an excellent recovery. She was thirty-six when it occurred, and is now forty-three, and has never been sick since.

Avoid Protracted Toil.—The work of the day should be conducted in the best manner. Thorough, careful, intelligent work during seven or eight hours is much more profitable than ten hours of hurried work. In cities, merchants and business men seldom apply themselves more than six hours a day, and probably the greater part of the best work done in that city is performed in less than five hours each day. There is no reason why farmers who create the wealth of the world should labor more hours than they who manage this wealth. Formerly, constant toil was required to support a family, because all work was done at a disadvantage, tools of all kinds were poor, and labor saving machinery was unknown. More actual work was required in the last generation to make the clothing of a family than is now required to buy the clothing, and the food added, and every year the farmer has new advantages and powers in this direction. It is for this reason that the farmer should seek to enlarge his means for acquiring information, and of rising to new dignity. This he can only do by having more leisure, and by avoiding protracted toil. There is no good reason now why he may not unite culture and elegance with rural pursuits.—*Micawber.*

Applying the Stomach Pump.—In the Glasgow *Medical Journal*, Dr. McEwen recommends that in the use of the stomach pump the head should be bent forward on the introduction of the tube, instead of backward, as is generally taught in books. When the head is thrown backward, he says the spine becomes convex anteriorly, and as the tube is passed along it has a tendency to impinge upon the larynx; but when the head is bent forward then the mouth, pharynx and œsophagus form a curve along which the tube glides gently into the œsophagus, and at the same time is directed away from the larynx.

A species of dysentery or approximation to light cholera has been prevalent in Ulsh and vicinity, for a short time, assuming the character of an epidemic. In the cases of several children and adults the attacks have proved speedily fatal.

Death Indoors.

Multitudes of persons have a great horror of going out of doors for fear of taking cold; if it is a little damp, or a little windy, or a little cold, they wait, and wait and wait; meanwhile weeks and even months pass away, and they never, during that whole time, breathe a single breath of pure air. The result is, they become so enfeebled that their constitutions have no power of resistance; the least thing in the world gives them a cold; even going from one room to another, and before they know it they have a cold all the time, and this is nothing more or less than consumption; whereas, if an opposite practice had been followed of going out for an hour or two every day, regardless of the weather, so it is not actually falling rain, a very different result would have taken place. The truth is, the more a person is out of doors the less easily does he take cold. It is a widely known fact that persons who camp out every night, or sleep under a tree for weeks together, seldom take cold at all.

Very many of our bad colds, and those of a most fatal form, are taken in the house, and not out of doors; taken by removing parts of clothing too soon after coming into the house, or lying down on a bed or sofa when in a tired or exhausted condition from having engaged too vigorously in domestic employments. Many a pie has cost an industrious man a hundred dollars. A human life has many a time paid for an apple dumpling. When our wives go to work, they become so interested in it that they find themselves utterly exhausted before they know it; their ambition to complete a thing, to do their work well, sustains them till it is completed. The mental and physical condition is one of exhaustion, when a breath of air will give a cold, to settle in the joints, to wake up next day with inflammatory rheumatism, or with a feeling of stiffness or soreness, as if they had been pounded in a bag; or a sore throat to worry and trouble them for months; or lung fever to put them in the grave in less than a week.

Our wives should work by the day, if they must work at all, and not by the job; it is more economical in the end to see how little work they can do in an hour, instead of how much. It is slow, steady, continuous labor which brings health, and strength, and a good digestion. Fitful labor is ruinous to all.—*Hall's Journal.*

Useful Information.

Toughened Glass—Its Applications.

Our readers are already apprised of the new process for toughening glass, what toughened glass is, how it is produced, etc., but perhaps it may be interesting to consider some of its many applications. A lecturer in England alluding to this matter recently said: "It therefore only remains for me to indicate the direction of its practical application. I say 'indicate,' for were I to enumerate all the purposes to which it can be usefully applied, I should simply become wearisome. It is possible that there is not one corner in the whole domain of the arts, sciences, and manufactures, where its presence will not in time be made manifest in some way or other, and its usefulness appreciated, whilst for purposes pertaining to social life its application would seem to be unlimited. The miner would have a safer safety-lamp than ever Davy gave him, and the engineer's gauge glass would stand the highest steam pressure and alternations of heat and cold without fear of mischance. In chemical work it would supersede lead for tanks, and the present costly and unreliable glass pumptubes would be far less expensive, and infinitely more durable. So with brewers; they would find it a most useful friend in their vats, which they could thoroughly and easily cleanse, and keep free from secreted stale germs of organic life, which develop and reproduce themselves in the process of fermenting beer, in a highly objectionable manner. For water pipes it would offer the advantages of strength without corrosion. As sayers, I am told, would use it instead of platinum in some processes. In silk-spinning machinery slider eyes, or guides, which are so soon cut through by reason of the speed at which the silk passes through them, would be rendered very durable if made of toughened glass. Another application, which has suggested itself to an ingenious American gentleman since the first notice of M. de la Bastie's invention appeared, is the manufacture of printing types and rollers for printing presses, and this idea is now being developed into practical form. Seeing the wide range of domestic and social wants which toughened glass promises to meet, I know not where to begin, and were I to begin I should not know where to end. I can only observe in this connection that toughened glass promises to supersede porcelain and similar wares, and to add a real and permanent value to glass utensils of every kind. It will probably supersede enamel on culinary utensils, and in other similar directions."

A Fine Imitation Marble.—An elegant imitation of marble is made in Dresden for architectural purposes, by impregnating sandstone with silicic acid and alumina. In Naundorf such stones are prepared, which are intensely white, transparent and capable of taking a polish.

Rules for Mechanics.

To get an engine into line and square the shaft, set up two lines, one parallel to the axis of the cylinder or through the cylinder, if possible, and the other perpendicular to the first, in the same plane. These are reference lines to measure from, to bring the shaft and guide into line.

To find the length of a driving belt before the pulleys are in position, add the circumference of the two pulleys, divide the product by two, and add the quotient thus obtained to double the distance between the centers of the two shafts, which will give the length of belt required. For a crose belt add the circumference of the two pulleys, multiply the product by three, and divide by two; the quotient added to double the distance between centers of both shafts will give the length required.

To find where to cut belt holes in floors, measure the distance in inches from center of driving shaft to under side of floor; on the upper side make a mark over the center of shaft. Now measure the distance from center of shaft on machine to be driven to floor, making a mark on the floor immediately beneath the center, then measure the distance between the two marks. Transfer these figures to a board or paper, draw off the driving and driven pulleys after finding their diameters at the distance from each other and the floor line previously obtained, and draw the lines representing the belt cutting the floor line, which will show where the belt passes through the floor. The drawing can be made to a scale to reduce it to convenient dimensions, maintaining the proportions. The holes may now be marked off on the floor and cut with a certainty of being correct. In making the drawing it is best to do it full size on the floor if room can be had, and allowance must be made for the thickness of flooring.

When a system of pulleys or blocks is operated by a single rope, the charge which can be sustained by the lower block is equal to the weight applied to the end of the rope multiplied with the number of ropes supporting the block.

Thus when the upper and lower blocks possess one pulley each, the load will be supported by a twofold rope, for two pulleys by a fourfold rope, and therefore in the first case every pound on the end of the rope will support two, and in the second case four pounds on the blocks.

The pressure obtained by a screw is found by multiplying the force applied to the lever with twice its length, and with the number 3,1416, and dividing the product by the distance of the screw threads.

This rule is founded on the facts, first, that a screw is nothing but a curved inclined plane, of which the circumference is the length and the distance of the threads the hight; and second, that the force is applied by a long lever outside the screw, and moves around the screw at a distance equal to the length of the lever, in a circle to which the diameter is equal to twice the circle or radius, and the circumference equal to twice the radius multiplied by 3,1416.

It is also observed here that for every total revolution of the screw, it descends as much as the distance of the threads, while the force applied moves through a distance of several feet in the large circle at the end of the lever.

Stains for Wood.

Green.—Take three pints strong vinegar, four ounces beet verdigris, ground fine, one-half ounce sap green; thoroughly mix these ingredients.

Purple.—Take one pound of chipped logwood, three quarts water, four ounces pearlash, and two ounces powdered indigo. Boil the logwood in the water for half an hour; then add the pearlash and indigo.

Cherry.—Take three quarts rain water, four ounces annetto; boil in a copper kettle till the annatto is dissolved, then put in a piece of potash of the size of a walnut. Keep the mixture over the fire half an hour longer, and then it may be bottled for use.

Mahogany.—Wash the wood with diluted nitric acid (ten parts of water to one of nitric acid). For rose-wood, glaze the same with carmine or Munich Lake. Asphaltum, thinned with turpentine, forms an excellent mahogany color for new work.

Blue.—Dissolve copper filings in aquafortis; brush the wood with it, and then go over the work with a hot solution of pearlash (two ounces to one pint of water) till it assumes a perfectly blue color.

A good blue pigment for painting skies is not easily obtained because the most perfect materials for that purpose are so difficult to obtain. Ultramarine, French ultramarine, and cobalt are the three articles used. The most natural color for skies and distances is made from cobalt. It is a permanent color, and needs to be used with care, but under skillful manipulation, any desired effect can be produced.

Fire Proof Roofs and Stairs.—If you will have wood floors and stairs, lay a flooring of the thickest sheet iron over the joists, and your wood upon that, and sheath your stairs with the same material. A floor will not burn without a supply of air under it. Throw a dry board upon a flat pavement, and kindle it as it lies if you can. Prevent drafts, and, though there will be fires, no houses will be consumed.

Domestic Economy.

Luncheon in the City.

The two most common subjects of complaint with wives and mothers of limited income in this and other large cities are, first, that they are debarred from society by the expense of the ordinary methods of hospitality; and secondly, that the habits of city life separate them from the companionship of their children. The wife of a man in moderate circumstances tells you that she cannot afford to give balls, kettledrums, or even dinners to her friends; that her boys and girls scurry off to school after a hurried breakfast, and dine at noon alone; for, being a woman of sense, she will not allow them to eat the heaviest meal of the day at six or seven P. M., the hour when their father comes home to dinner. The family dinner at mid day, and the evening tea of island towns, at which parents and children gather about the table and learn to know one another through the interests and feelings of every day, are almost unknown in the same grade of social city life.

Now we suggest that luncheon is a meal of undeveloped opportunities to the housekeeper and mother. We do not by any means refer to the elaborate state luuches given by leaders of fashion during the last two or three years, where the floral decorations alone cost a liberal annual income. But there is no reason why any housekeeper should not, with a little personal trouble, convert her children's dinner into a delicately served savory meal to which she could invite informally two or three of her lady friends. It is emphatically a woman's meal; and husbands need not hint cynically that the chief dish will be gossip. There is no better talk than that of three or four cultured, clever women, alone together; none which would be more civilizing and effective on children. How is a child to acquire good breeding if it is not brought socially into contact with well-bred people? American children in cities are crammed with all kinds of knowledge, but they are left to the companionship of servants and of one another; who can blame them if they too often betray the ideas and manners of the kitchen and the ball ground?

The dishes on the lunch table should be light—but prettily served. A meal of cold meats, pickles, creams, fruit, thick chocolate, with dry toast, etc., can be more easily made attractive, as every experienced housekeeper knows, than the heavy coarsee of a dinner. It is advisable, too, for this noonday meal, to color the table warmly. The majority of economical housewives buy the plain white china for every day use, but it has, to us, a chilly and meager air in conjunction with the ordinary napery. There are equally cheap sets of both English and French china of delicate and rich colors, which, under skillful handling, convert an ordinary meal into a picture. The most beautiful and (where there is any garden room) the cheapest table decoration is, of course, flowers. A little care and trouble will provide this without expense. Morning-glory, Cobea, wild ivy, and Lemii will grow each in a foot square of the back yard, and bestow themselves skyward thereafter, and with a few boxes of Coleus in an attic window, will crown your board with splendor like jewels, until the snow comes. This daily lunch requires, perhaps, time and care; but our reader will find her reward at the end of the year, if she have established the custom in her house of a wholesome, unhurried, dainty meal, where she can meet her children and friends cheerfully and with little cost.—*Scribner.*

How to Keep Meat Fresh a Long Time.

We have for authority the *Inter-Ocean* for saying that the following recipe is worth the subscription price of any newspaper in the land:

As soon as the animal heat is out of the meat, slice it up ready for cooking. Prepare a large jar by scalding well with hot salt and water. Mix salt and pulverized saltpeter in the proportion of one tablespoonful of saltpeter to one teacupful of salt. Cover the bottom of the jar with a sprinkle of salt and pepper. Put down a layer of meat, sprinkle with salt and pepper, the same as if just going on the table, and continue in this manner till the jar is full. Fold a cloth or towel and wet it in strong salt and water, in which a little of the saltpeter is dissolved. Press the cloth closely over the meat and set in a cool place. Be sure and press the cloth on tightly as each layer is removed, and your meat will keep for months. It is a good plan to let the meat lie over night after it is sliced, before packing. Then drain off all the blood that oozes from it. It will be necessary to change the cloth occasionally, or take it off and wash it—first in cold water—then soak in salt and water as at first. In this way farmers can have fresh meat the year round. "I have kept beef," says the writer, "that was killed the 12th of February, until the 21st of June. Then I packed a large jar of veal in the same way during the dog days, and it kept six weeks."

Gravy for Veal or Chicken.—Put a tablespoonful of butter in a hot frying pan. When it begins to brown dust a tablespoonful of flour into it, stirring constantly with a spoon; and salt and pepper; then in one pint of milk—cream, if you have it; let it boil five minutes and pour over the dish of meat.

Ventilating Mines.

Levi J. Heury, of this city, has recently patented through the agency connected with thie office a process for ventilating, purifying and cooling the air of mines, wells, sewers, vaults, etc. It consists principally in the employment of water, which is carried in suitable pipes to various parts of the space to be operated on and is discharged through spray jets or nozzles. This spray, when falling down the shaft, will carry mechanically entangled with it a considerable amount of air, while similar spray jets in various parts of the space below will serve to cool the air. One form of the apparatus to be used in mines may be described as follows:

At the top of a mining shaft a connection with a hydrant or tank of water should be made, through the medium of any metallic pipe or India rubber hose. The pipes for the main supply of water should be permitted to descend the shaft. At every 100 or 200 feet, a jet or nozzle is securely connected with the pipes or wiuze, so that in its downward course the water may be thrown out in the form of a spray. These sprays may be put in any required place.

The action of a spray of water in purifying the atmosphere is too well known to require any further explanation. In addition to this cooling of the air a further advantage is gained in forcing downward of a body of cool air on account of its becoming mechanically entangled with the falling spray, thus furnishing a certain amount of air for the purpose of ventilating the lower levels of a mine. The spray of falling water is also very valuable as a protection against fire in such mines or shafts as are excessively dry, and the full strength of the timbers will be better preserved by this wetting.

In order to increase the circulation of cool air in the mine, the inventor further utilizes the water which passes down the pipes, by connecting the pipes at certain points with the box or case of a water wheel, said wheel being turned by the momentum of passing water. The pipes are continued below the wheel case, and the different discharge openings below will cause a sufficient current to rotate the wheel. This wheel is connected with a fan-blower at a suitable point, so that this fan will take a portion of the air cooled by the spray and force it downward through pipes to different points where it can be used in the mine. The water to be used as above described, may be taken either from the surface, or it may be collected in tanks at different parts of the mine or shafts, care being taken that sufficient fall is given to produce the necessary result. For local use by the miners on low levels of deep mines where the temperature is elevated and the air close and stifling, flexible tubes are connected with the main pipe, or with the tanks, and these tubes are provided with spray nozzles, which are always within easy reach of the operator, and may in some cases be attached to the body so that if desired a spray may be thrown over the person. Extra faucets or cocks are connected with the pipes which pass through the timbers, and which, in case of fire in the timbers, can at a moment's warning be turned on by workmen, thus giving a sense of safety in the event of a fire in the mine.

The Hope Iron Works.

This institution is the latest addition to the list of San Francisco iron works, having just started active operations. Mr. W. W. Hanscom, formerly of the Ætna iron works, is proprietor. The works are located on the corner of Minnesota and Santa Clara streets, on the Potrero, and cover a space of 100x200 feet. The main building is 40x160 feet, the machine shop taking up 80 feet, the pattern shop 50 feet and the blacksmith shop 30 feet. The offices and drafting room are at the extreme end of the main building, and are neatly fitted up. The foundry building covers a space of 40x100.

Mr. Hanscom has made a study of the proper arrangement of the works, so as to facilitate operations as much as possible and make everything convenient for handling. In the foundry is a cupola furnace of six tons capacity, with a No. 5 Sturtevant blower. The pipe leading the air from blower to furnace is much larger than is usually considered proper, but Mr. Hanscom says by the arrangement he has made, he gets as large a blast as if he used a blower two sizes larger with smaller pipe. Coke is used altogether for smelting purposes, and the screenings for fuel. This is found advantageous, and another industry is utilized.

In the machine shop the machinery is all new and first-class. The tools were made to order by Bement & Son, of Philadelphia, and are the best that could be procured. There are now four lathes in the shop and two on the way, from twelve inches up to seven feet capacity, to turn from ten feet up to twenty-four feet in length. There is also an eight-inch shaping machine, and a twelve-inch slotting machine. At present the works are run by a ten-horse power engine for the machine shop and a four-horse power engine for the foundry. There are also two drilling machines, a bolt cutting machine, steam hammer, etc.

The shops are all arranged on one floor, to save the trouble of stairs. The buildings are lofty and well ventilated, and the different shops arranged in relative positions to accord with the usual progress of work.

These works have been running only about six weeks, but they already give employment to twenty-five men, and work is rapidly accumulating. Mr. Hanscom will make a specialty of stationary and marine engines. He has made a study of steam engine progress, and takes the greatest interest in their manufacture and work. He makes a style of vertical engines with a broader base than usual, in which several improvements are combined. The patterns and designs for this engine are now being made in the shop.

At these works there is now a hoisting engine under way for a Washoe mining company's prospecting operations; also a thirty-five horse power engine for a mine in Idaho. Mr. Hanscom is also building a launch engine which will be exhibited at the coming Mechanics' Institute exhibition. The launch is thirty feet long by six feet beam. These works will make a specialty of marine machinery of all kinds, and Mr. Hanscom intends turning out some steam launches which will be a credit to California. He has grown up in California, and feels a natural pride in manufacturing articles of this class which will show that California mechanics can do as well as those elsewhere.

No inconvenience is felt by the distance of the works from business centers. The town is rapidly growing over toward the Potrero, and before many years most of the iron works will probably move in the same direction. Many of the foundry men have talked of moving to the Potrero for some time, but Mr. Hanscom has taken the initiative. The idea he had in starting this shop was that all the shops were doing a great deal of general work and built everything, including engines. If he makes a specialty of engines he is confident that he can build them cheaper than shops which do not. As good work is required in this line here as in any part of the United States. The people here expect more work out of an engine than is usually the case. In order to compete successfully with older firms, Mr. Hanscom bought the best tools possible, with no regard to cost, and engaged the best workmen, in all departments, that he could procure. With good tools, good workmen, a convenient shop, pride in his work and long experience, he is confident that he can build up a successful business, and turn out work which will reflect credit on himself and our home industries.

Testing Iron and Steel.

The board appointed by the President of the United States under the provisions of an act of Congress of March 3d, 1871, "to test iron and steel and other metals," has instructed a committee composed of R. H. Thurston, L. A. Beardslee, U. S. N., and Q. A. Gillmore, U. S. A., to continue an investigation of those modifications of the various properties of the metals which are produced by changes of temperature. The committee are desirous of supplementing these experimental researches with such results of other experimental work and of observation as may be obtainable from authentic sources; they have therefore issued a circular soliciting such contributions from investigators and observers as may be deemed valuable in assisting the task assigned them.

The behavior of rails and of machinery exposed to the extremes of temperature observed in northern latitudes, where exposed to wear or to breakage, will be likely to afford valuable data. The character of the fracture and the texture of the abraded surfaces, as well as the statistics ordinarily collected, should be noted. Specimens exhibiting peculiarities of behavior or appearance, and photographs of masses which it may not be convenient to forward, will be of value. Where exact quantitative analysis of metals exhibiting unusual characteristics can be given, they will add effectively in the determination of the causes of such peculiarities.

The statistics of well managed railroads are expected to afford useful and reliable information. Rolling mills producing rails and other forms of rolled iron which are tested by the drop, may be able to furnish more accurate statements of the effect of changes of temperature in modifying resistance to shocks.

Some experimental work has already been done in this field, and it is desired that the results of such researches may be communicated in as great detail and with as much accuracy as possible. Published monographs, reference to papers published in scientific, engineering or other periodicals, and unpublished papers, will be received as valuable contributions.

All assistance rendered the committee in the endeavor to ascertain the character of the change of the force of cohesion produced in the metals and their alloys by variation of temperature, to determine the mathematical expression of that law, and to obtain such formulas, either exact or approximate, as will make these results conveniently and practically available to engineers and constructors, will be properly acknowledged. It is to be hoped that some of our iron workers on this coast will do what they can to assist the committee in their labors, as no doubt many of them might furnish valuable data if they are disposed to take the time to write out the results of their experience. Prof. R. H. Thurston is chairman of the committee, and may be addressed at the Stevens Institute of Technology, Department of Engineering, Hoboken, N. J.

The Mechanics' Institute Exhibition.

It should be borne in mind by those interested, that after July 20th the managers of the Mechanics' Institute will reserve no space in the pavilion for exhibiting at the approaching fair. Already more than three-fourths of the space has been applied for, and notwithstanding the increased area provided for exhibitors this year, it is more than probable that the demand for space will exceed the capacity of the pavilion. A few weeks since we made brief mention of a number of the more important exhibits for which space had been secured. Since then, we have to note several other novelties. A quartz mill, complete in all its appointments for feeding, crushing, and amalgamating ore, will make plain to novices the running method by which our inventive genius entices the precious metals from their association with baser minerals.

The Board of Managers consists of the following named gentlemen: A. S. Hallidie, James C. Patrick, Henry L. Davis, D. E. Hayes, Asa R. Wells, P. B. Cornwall, Chas. Elliot, George Spaulding, H. S. Smith, W. P. Stout, Jeremiah Browning, J. H. Stontenborough, R. B. Woodward and James Spiers.

President Hallidie has appointed the following committees:

Auditing Committee—Stout, Browning and Hayes.

Committee on Building—Wells, Smith and Spiers.

Committee on Circulars and Classification—Patrick, Spaulding and Stoutenborough.

On Printing and Advertising — Spaulding, Stoutenborough and Stout.

On Power and Machinery—Spiers, Smith and Elliot.

On Rules, Regulations and Rewards—Browning, Patrick and Davis.

On Music and Decorations—Davis, Woodward and Cornwall.

On Privileges—Elliot, Spaulding and Woodward.

On Location—Hayes, Browning and Spiers.

On Police— Smith, Davis and Cornwall.

On the Horticultural Garden— Woodward, Stoutenborough and Davis.

All communications in regard to space and matters relating to the exhibition, should be addressed to the Secretary of the Board, Mr. J. H. Culver, No. 27 Post street.

Roasting Ores.

Written for the MINING AND SCIENTIFIC PRESS by O. H. AARON.

Notwithstanding the growing tendency to discredit the efficacy of fire in the purification of human souls, there is, at the present time, among mine owners, a marked revival of faith in plutonic agencies for the salvation of the precious portions of our ores from eternal perdition in the tailrace.

Without disparagement of the redeeming grace of the Patchen process, which I have excellent reason to believe is destined to do a good work on the Comstock ore, nor of my own, which is still in use in Mono county, leaving nothing to be gained by roasting, in the treatment of the partzite ores of that section, I venture to think there are but few cases in which an ore containing over $50 per ton, in silver, cannot be more profitably treated by roasting than by raw working; especially now that the chief difficulties are removed by the excellent mechanical appliances which the genius of a White, a Stetefeldt, have given to metallurgy.

I mention the names of White and Stetefeldt particularly because, on the one hand, the efforts of their predecessors in this line, myself among the number, have met with but little success, and on the other, those of their successors seem to be merely modifications, more ingenious than beneficial, of the vertical shaft of Stetefeldt, and the revolving cylinder with "grooves, cavities or projections," of White.

The features connected with roasting, which have caused that process to be regarded with distrust heretofore, are, firstly, dry crushing, which is somewhat hastily assumed to be essential; secondly, the cost of fuel; thirdly, the large quantity of salt required; fourthly, the high price of labor, together with the difficulty of getting or keeping skilled workers; and, fifthly, the increased initial cost of works. I propose to consider these objections seriatim.

As to dry crushing, it is urged that a mill with a given number of stamps can crush only half as much dry as with the aid of water. This is partly due to the fact that, when the ore is to be roasted, it must be crushed, in general, finer than is absolutely necessary when it is to be worked raw in pans, which, in that case, may be made to do a part of the work which must otherwise be done in the battery. This grinding, however, takes power and consumes iron, and it is yet a mooted question, among mill men, whether it is more economical than fine crushing in the battery.

Granting, however, that the ore may as well be crushed in the battery so as to pass through a 40-mesh screen, which is fine enough for roasting, it still remains true that more work can be done in the wet way than in the dry.

But, aside from the fact that it is better to get the silver out of one ton of ore than to throw two tons away, dry crushing is not absolutely necessary for roasting. The ore may be crushed wet and dried in a revolving iron cylinder by the waste heat from the roasting furnace, the cylinder being provided with "liftere" which carry the ore upward as it revolves, and, by the concussion of its fall, prevent the formation of lumps or break them to powder when formed. A cylinder for this purpose is provided by Mr. White when desired.

To the objection that crushing finer will yield an increased proportion of slimes, I answer, save the slimes by causing the water to return to the battery, instead of letting it run away; ore cannot be too fine for roasting in White's furnace, unless it is intended to extract the silver by leaching, of which hereafter.

But the process of crushing ore dry is not necessarily so slow as is often supposed. The Northern Belle mill is now crushing dry at the rate of forty-two tons per day with only twenty stamps, and though it is admitted that such a result is exceptional, and is doubtless traceable in part to the soft and friable nature of the ore, yet much is also due to perfect construction and skillful management of the battery. The real difficulty lies, not in the crushing, but in the discharge of dry ore, and this is greatly increased when it is not perfectly dry but contains even so little as one per cent. of moisture, a quantity which cannot be perceived by the eye. If the ore is soft, with but little quartz, it is almost certain, though apparently dry, to contain from two to seven per cent. of water, and as heat is always produced by the concussion of the stamps in a battery, this water evaporates, and condenses again, more or less, on the screens which, thus moistened, become clogged with fine dust. I have often in cold weather seen little streams of moisture trickling down the upper part of the mortar, in the feed opening, caused in this way.

Another effect of moisture, when the ore contains slate, clay or iron-stone, in fact almost anything except quartz, is that it cakes under the stamps, which then pound on top of the mass without penetrating, or making it fly against the screens, so that the discharge is entirely arrested till repeated blows and the heat generated cause the cake to break up, when the discharge is quite rapid for a time. It may be thought that these remarks are uncalled for, as driers are very generally used; but my observation has shown me that the usual means are not sufficient to give the best results; the ore must contain no moisture which

can be evaporated at the temperature of the battery. The arrangement of screens described and illustrated some months ago in the Press, will also greatly increase the duty of a dry battery, besides offering other advantages.

The cost of fuel is reduced to such a low figure by the use of the new furnaces, as no longer to constitute a valid objection to roasting, as one cord of wood suffices for from fifteen to eighteen tons of ore.

The next item is salt, of which the quantity required is, in general, less than formerly, and as some is always used in raw working, together with other chemicals which are not required when the ore is roasted, the difference in expense is not great, and may probably be offset against the greater loss of quicksilver in the former.

The most serious objection to roasting, that referring to workmen, however applicable to the old reverberatory furnace, can no longer be urged in defence of a wasteful method of treating our ores. White's furnace, roasting fifteen or eighteen tons ors in twenty-four hours, requires only four men, two on a shift, to work it, and of these only one on each shift need be a skilled workman, and his responsibility is limited to the maintenance of a proper and uniform heat, under the direction of the millman.

An increased initial outlay for works cannot be avoided if amalgamation is to be used, though probably the outfit for roasting and leaching would not cost more than for raw pan working. This point, however, should not weigh with those who have the means of working their mines in the best manner.

I will here suggest to mine owners that many costly failures are to be attributed to their neglect of employing a metallurgist till after the works are erected. In many cases mills have been built before a mine has been developed, but even when, as is proper, the miner has been first called on to establish the existence of a paying mine, it is usually seen that the next expert employed, instead of being the metallurgist, is the millwright, who, being required to take a contract for "a mill" of so many stamps, and in general being familiar with only one kind, viz: the stereotyped "Washoe pan mill," builds one which is not adapted to the ors to be treated, and as a possible change of programme is never provided for, it results that when such a change has to be made, the new arrangement must suffer under many inconveniences, and therefore works at a disadvantage. I could cite cases in point, but prefer to let readers make their own application.

The more judicious plan for parties about to embark in a mining enterprise, not being themselves familiar with details, would be, after having satisfied themselves that their mine will justify the erection of reduction works, and having also ascertained the description of ore it will yield, to employ a competent metallurgist, and, if necessary, to go to a little expense for apparatus to enable him to make all needful tests and experiments, whereby to ascertain what process of treatment is most suitable to the ore and surrounding conditions. When, and not before this has been thoroughly done, the employment of the mechanic is in order to co-operate with the metallurgist in constructing, under his supervision, a suitable and economical plant.

At the present time quite a number of companies, having decided that roasting their ore is a necessity, are deliberating as to which of the many furnaces now in the market will be the best for their purpose. Among numerous competitors for public favor, White's revolving cylinder, with continuous feed and discharge, is one of which I can speak from actual observation and information on which I can rely. One of these furnaces has been doing excellent work at Hutches' canon, in Esmeralda county, for about two years, and I know for a fact that much of the ore roasted in it quite successfully was of a character which I should hesitate to undertake treating in a reverberatory furnace, as it contained a very large percentage of lead.

Another has been recently put up at Benton, where the ore from the Camanche mine, formerly worked raw by my process, has of late quite changed its character, and is now a very refractory compound of pyrites, galena, blende, fahlerze, etc. This furnace is also doing good work, chloridizing, at last accounts, to eighty-five per cent., and as the operator is a novice in roasting, better results are looked for shortly.

Both of these furnaces receive the ore at that end of the cylinder which is farthest from the fire box; the cylinder is therefore slightly inclined downward toward the flames, which, entering at the lower end, traverse its whole length in one direction, while the ore, mixed with salt, alternately lifted by the rotation of the grooved cylinder, and falling through the flames, gradually, in the course of fifteen minutes, works its way towards the fire box and falls into a chamber, whence it is drawn to the cooling floor, and is then ready for the pans.

Another modification of this furnace, in which the ore is blown into the cylinder (which in this case inclines downward away from the fire,) at that end at which the flames also enter, was put up some years since near Benton. It also did excellent work, chloridizing, by my tests, up to eighty five and one-half per cent. and by those of the operator sometimes as high as ninety-two per cent. The mill, however, being in many respects defective, and in bad hands, soon ceased to run.

Of these two methods of working White's furnace, some prefer one and some the other. White's patents include both. Those who prefer to feed at the end farthest from the fire, proceed upon the theory that the ore must be heated gradually, in order to prevent sintering, and certainly this view is sustained by observed facts in the working of reverberatory furnaces; but in all chemical operations it is emphatically true that circumstances alter cases; in other words, conditions modify results.

In the reverberatory furnace the ore lies in a mass upon the hearth, exposed to heat throughout, but to the oxidizing action of air only upon the surface; the most industrious workman can keep a small portion only in movement at any given moment. The heat must, therefore, be as low as is consistent with combustion of the sulphur, till time enough has elapsed to allow the workman, by stirring the ore, to expose every particle to oxidation, otherwise the fusible sulphurets will sinter.

In the furnace in question the conditions are quite different. Cool ore is constantly poured in, accompanied by a blast of cool air, both of which tend to moderate the intensity of the heat at that point. The blast of air entering with the ore scatters it in a shower in which no particle is in contact with another, but each is surrounded by an atmosphere of unburned air, which is gradually, though rapidly, heated; and in which the sulphurets, in minute particles, are readily oxidized, at least superficially, before they even touch the lower side of the cylinder, which is kept red hot from end to end, and, by its revolution, causes the ore to fall many times through this *feu d'enfer* (hell of a fire), before it finally reaches the point of exit, exposed throughout to the action of glowing gases of sulphurous, sulphuric, and hydrochloric acids, chlorine and volatile chlorides, and, being oxidized at an early stage of its progress, is in the best condition for chloridation, and for the decomposition of arseniate or antimoniate of silver which may have been formed.

The plan of feeding with a blast, at the fire end of the cylinder, enables the treatment of a larger quantity of ore than the reverse, because, as the current of air aids the progress of the ore, it follows that the smaller particles, which are the soonest roasted, pass most quickly through, while the coarser and heavier portion remains for a longer time exposed to the action of the fire. Now, precisely the reverse of this takes place when the furnace is fed at the other end, for then the ore must travel against the draft, and the smaller particles are retained the longest, excepting those which, from their lightness, are at once carried away to the dust chambers, while a certain portion is kept oscillating backward and forward, as the force of the draft or that of gravity preponderates. Also, the advantage of the blast in furnishing a copious supply of oxygen just when and where it is needed, is entirely lost, as no blast can be used; while an auxiliary fire is required, just as in the Stetefeldt furnace, to roast the fine dust which cannot pass through the cylinder.

For these reasons, and knowing that the furnace has done good work when fed at the fire end, as well as the other way, I desire to retract, at least for the present, any remarks I may have made to the effect that White was feeding his furnace at the wrong end, and I would advise others to suspend judgment, and avoid committing themselves to what may prove to be an error which a candid consideration of the new conditions involved would have prevented.

As the Jefferson company have ordered one of these furnaces, which will be put up with a blast, the question of "which end" will soon be answered; and, as White's different patents cover both methods, it is to be presumed he will finally adopt the one which proves to be the best, though at present he prefers to feed with a blast.

It is hardly necessary to enlarge upon the advantage of a continuous feed and discharge, but, for the benefit of those who fear that the ore may pass too quickly through the cylinder, I will state that the more recent plans embrace an arrangement by means of which the inclination may be altered at any moment, so as to cause the ore to pass as slowly as may be desired.

When we have persuaded mine owners, for their good, to look favorably on the roasting process, we will try to call attention to methods of extracting the silver without the use of expensive quicksilver, and amalgamating machinery. Let us hasten slowly.

The Black Hills.

The Black Hills gold excitement has in a measure subsided, although a number of enthusiastic prospectors still have golden visions of that tract of country, notwithstanding the contradictory reports which have been made public from time to time. At last we seem to have something apparently reliable from a person sent out under Government auspices. The Interior Department has received a full and complete report from Professor Jenny, chief of the scientific expedition sent out to investigate the condition of the supposed gold fields in the Black Hills. The report confirms the first dispatch of Professor Jency, in which he said that nothing had yet been discovered that would warrant extensive mining operations in the Black Hills. His report was in direct contradiction of the glowing tales of correspondents, and opens up a question of veracity. The report proceeds at once to explode the stories about the rich fields on French creek. It says this is the spot where the miners have said the washing of loose dirt in the digging panned out twenty-seven cents per pan. He worked out nine buckets of the same material, and only secured twenty-two cents out of the whole. He says the best of the dirt does not average a cent and a quarter per pan. There is some gold found, but it exists in very small quantities, and is spread over such a large area of territory as to make practical digging a failure. The next point Professor Jenoy will examine will be in the Cheyenne river, north of the present camp.

In all probability this report will be as little believed as those discouraging ones which came before; and the prospectors will recognize nothing but their own experience as authentic. Those enthusiastic individuals who have money and time to spare can then try their luck, but our advice to those having good claims or steady work, is to stay at home and attend to their business and let the Black Hills alone for the present.

Colorado Scenery.

We have been able to give the readers of the Press several illustrations of the magnificent natural scenery to be met with in Colorado, as made known to us by views obtained by Prof. Hayden, in his exploration of that section. Those heretofore published have been so warmly commended by our readers, that we this week present another, which we think not less beautiful than those preceding it. Whiterock peak is thus described:

At the head of Teocalli creek is a high mountain peak which we named Whiterock, from the fact that a seam of white or light gray igneous rock, sixty feet wide, passes through the middle of the summit vertically. The material is quite soft, disintegrating into moderately coarse sand. The rocks composing the mountain are quite varied in texture, though all evidently of igneous origin. The jointage is in many cases vertical, separating the mass into blocks varying from a few inches to two or three feet cube. This vertical jointage gives a sort of columnar appearance to the sides of the peak in the distance. The sides are also deeply furrowed. There are three sets of master-joints, with a multitude of smaller ones. The consequence is that the sides of the mountain and the several amphitheaters are covered with immense quantities of *debris*. The whole mass is filled with water and ice during the winter, and in the spring, as the ice and snow melt, it moves down the declivities slowly, like a glacier. Sometimes cavities or reservoirs are made, and the melted snows form beautiful little lakes.

WHITEROCK PEAK.

From the summit of Whiterock Mountain the view on every side is most remarkable, presenting the aspect of chaos, as if the entire group of stratified rocks, which originally covered the area now occupied by the Elk mountains, had rested on a vast pasty mass of the granite, but which, by forces generated in this pasty mass, had been lifted up and tossed, as it were, in every direction. The faults are very numerous and of huge dimensions. Sometimes a group of strata is broken off, so that one portion is from 100 to 2,000 feet above the other portion. Sometimes 1,000 to 2,000 feet will be elevated by a force acting very nearly vertically, so that some of the loftiest peaks, as Maroon Peak, 14,000; Black Pyramid, 13,000, and many others nearly as high, are composed entirely of stratified rocks inclining at small angles. Again, the beds are tipped off from the granite core at all angles from 10° to a vertical, and not unfrequently past a vertical, and there are in the Elk range the most wonderful instances of the complete overturning of immense groups of beds, so that for several miles there is a double series, from the Silurian up to the Cretaceous, inclusive, and then rising upward in inverse order, as is shown at the head of East river and near Snow Mass peak.

At the celebration at Rocklin, Placer county, on the 5th inst., four men, including a Chinaman, were severely injured by the premature discharge of a small cannon. It was the old story,—the piece became red hot and the powder ignited as it was put in.

Work at the Wilmington bar is progressing satisfactorily. The *Enterprise* thinks dredging has brought to the surface indications which give assurance of a permanent channel.

It is reported that thirty-five bridges were destroyed by the recent floods in the south of France.

Miscellaneous Notices.

QUICK-SILVER.

UNITED STATES PATENT OFFICE.

The Quicksilver Mining Company of New Almaden, California—Trade-mark for Quicksilver Flasks.

Statement of trade mark No. 1199, registered October 19, 1873; application filed September 29, 1873.

Specification describing a trade-mark, used by the Quicksilver Mining Company, a company chartered by the State of New York, and working and operating quicksilver mines at New Almaden, Santa Clara county, State of California, for Quicksilver Flasks.

Our trade-mark consists of the letter "A" straddling a circle. This letter has generally been painted upon the upper end of each flask, bottle, or jar in which the quicksilver is contained, its usual position being such that the opening or mouth in the upper end of the flask, bottle or jar will be between the spreading angular sides of the letter, the cross-mark of the letter passing along close to the edge of the hole.

This trade-mark we have used in our business for ten years last past. The particular goods upon which we have used it are quicksilver flasks, and it has always been applied as above described.

THE QUICKSILVER MINING COMPANY.
By J. B. RANDOL, Manager.

This trade-mark is also registered in the office of the Secretary of State, Sacramento, California, and all producers and dealers in quicksilver are cautioned not to use the said trade-mark.

For New Almaden Quicksilver, apply to
THOMAS BELL, Sole Agent,
Over Bank of California, San Francisco.

NEW ALMADEN QUICKSILVER.

TRADE **A** MARK.

The well known full weight and superior quality of the quicksilver produced at the New Almaden Mines having induced certain unscrupulous persons to offer their inferior productions in flasks having our trade-mark, "A," notice is given to consumers and shippers that quicksilver, "A" brand, guaranteed weight, can be purchased only from THOMAS BELL, San Francisco, or his duly appointed sub-agents.

J. B. RANDOL, Manager.

New Almaden, April 5, 1875.

Ayer's Hair Vigor

—FOR—

RESTORING GRAY HAIR

TO ITS NATURAL VITALITY AND COLOR.

Advancing years, sickness, care, disappointment, and hereditary predisposition, all turn the hair gray, and either of them incline it to shed prematurely.

AYER'S HAIR VIGOR, by long and extensive use, has proven that it stops the falling of the hair immediately, often renews the growth, and always surely restores its color, when faded or gray. It stimulates the nutritive organs to healthy activity, and preserves both the hair and its beauty. Thus harshy, weak or sickly hair becomes glossy, pliable and strengthened; lost hair regrows with lively expression; falling hair is checked and stablished; thin hair thickens; and faded or gray hair resume their original color. Its operation is sure and harmless. It cures dandruff, heals all humors, and keeps the scalp cool, clean and soft—under which conditions, diseases of the scalp are impossible.

As a dressing for ladies' hair, the VIGOR is praised for its grateful and agreeable perfume, and valued for the soft luster and richness of tone it imparts.

PREPARED BY

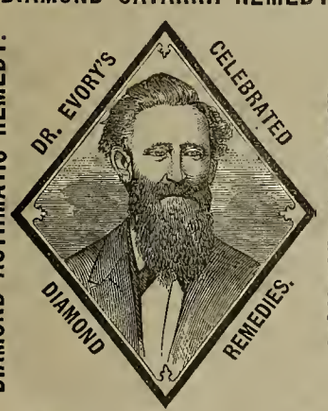
DR. J. C. AYER & CO., Lowell, Mass.,
PRACTICAL AND ANALYTICAL CHEMISTS.

☞ Sold by all Druggists and Dealers in Medicine.

CRANE & BRIGHAM, Wholesale Agents,
jy18-sa SAN FRANCISCO.

DIAMOND CATARRH REMEDY.

DIAMOND ASTHMATIC REMEDY.



DIAMOND INVIGORATOR.

DIAMOND NERVINE PILLS.

CATARRH AND COLDS—Dr. Evory's Diamond Catarrh Remedy never fails; perfect cure; try it; fifty cents per bottle. Depot, 608 Market street, San Francisco, Cal., opposite Palace Hotel. Sold by all druggists.

San Francisco Cordage Company.

Established 1856.

We have just added a large amount of new machinery of the latest and most improved kind, and are again prepared to fill orders for Rope of any special lengths and sizes. Constantly on hand a large stock of Manila Rope, all sizes: Tarred Manila Rope; Hay Rope; Whale Line, etc., etc.

TUBBS & CO.,
e30 611 and 613 Front street, San Francisco

Averill Chemical Paint,

MANUFACTURED BY THE

Cal. Chemical Paint Co.

PURE WHITE, AND ANY SHADE OR COLOR.

This Paint is prepared in liquid form, READY FOR APPLICATION—requiring no thinner or dryer, and will not spoil by standing any length of time.

It is Cheaper, more durable, more Elastic, and produces a more Beautiful Finish than the best of any other Paint.

It will not Fade, Chalk, Crack, or Peel off, and will last twice as long as any other Paint.

In ordering White, state whether for Outside or Inside use, as we manufacture an Inside White (Flat) for inside use, which will not turn yellow, and produces a finish superior to any other White known.

Put up in ¼, ½, 1, 2 and 5 gallon packages, and in Barrels. Sold by the Gallon.

For further information send for Sample Card and Price List, or apply to the office.

OFFICE and DEPOT: 117 Pine Street, near Front.
FACTORY: Cor. 4th & Townsend Sts.
3v9-eow-bp-1y SAN FRANCISCO, CAL.

AMMONIA!

For Washing and Cleaning Purposes.

For Sale by all Grocers.

This article is universally used in Europe, and, recently introduced for general family use in San Francisco and neighborhood, is already in great demand. It is now the intention of the manufacturers to introduce it all over the Pacific Coast, at prices which will bring it within the reach of every household.

It is unequalled for cleansing Woolen Fabrics, Cutlery, Carpets or Crockery; for Scrubbing Floors, Washing Paint, Removing Grease Spots, Shampooing or Bathing.

It renders water soft, and imparts a delightful sense of coolness after washing.

DIRECTIONS.—For Laundry, use two to four tablespoonfuls to a washtub of water. For bathing, use one tablespoonful in the bath tub. For removing grease spots, apply with a brush, undiluted, and wash with water afterward. For stimulating the growth of plants, use a few drops in every pint of water used in watering.

PRICE.—Per Pint Bottle, 25 cents; per quart Quart Bottle, 40 cents; per Half Gallon, 75 cents

Also, SULPHATE OF AMMONIA for chemical purpose, fertilizing, and the preparation of artificial manures. AMMONIACAL PREPARATION, for the prevention and removal of boiler scale. CRUDE AMMONIA, for general manufacturing, and PURE LIQUOR and AQUA AMMONIA for chemical and pharmaceutical purposes.

☞ Manufactured by the

SAN FRANCISCO GAS-LIGHT CO.
eowbp

SANBORN & BYRNES,

STAIR BUILDERS.

Mechanics' Mills, Mission Street,

Bet. First and Fremont, San Francisco. Orders from the country promptly attended to. All kinds of Stair Material furnished to order. Wood and Ivory Turners. Billiard Balls and Ten Pins, Fancy Newels and Balusters. 25v8-8m-hp

14 GMG OZ.

STEARIC ACID CANDLES

GEO. M. GRANT & CO.
PHILADELPHIA.

The Candles sold under the above well known "brand" are made only of Pure Stearic Acid, twice hydraulic pressed, are not cheapened by adulteration with crude material, and upon burning, give a large and brilliant flame, without running. 13v9-2ambp

The National Gold Medal

WAS AWARDED TO

BRADLEY & RULOFSON

FOR THE

BEST PHOTOGRAPHS

IN THE

Varney's Patent Amalgamator.

These Machines Stand Unrivaled,

For rapidity pulverizing and amalgamating ores, they have no equal. No effort has been, or will be spared to have them constructed in the most perfect manner and of the great number now in operation, not one has ever required repairs. The constant and increasing demand for them is sufficient evidence of their merits.

They are constructed so as to apply steam directly into the pulp, or with steam bottoms, as desired.

This Amalgamator Operates as Follows.

The pan being filled, the motion of the muller forces the pulp to the center, where it is drawn down through the apperture and between the grinding surfaces.—Thence it is thrown to the periphery into the quicksilver. The curved plates again draw it to the center, where it passes down, and to the circumference as before. Thus it is constantly passing a regular flow between the grinding surfaces and into the quicksilver, until the ore is reduced to an impalpable powder, and the metal amalgamated.

Setlers made on the same principle excel all others They bring the pulp so constantly and perfectly in contact with quicksilver, that the particles are rapidly and completely absorbed.

Mill-men are invited to examine these pans and setlers for themselves, at the office, 229 Fremont Street, San Francisco

SAMPLE COPIES.—Occasionally we send copies of this paper to persons who we believe would be benefited by subscribing for it, or willing to assist us in extending its circulation. We call the attention of such to our prospectus and terms of subscription.

The Mining Share Market.

Mining stocks continue dull, with small sales and low prices. Even the usual occasional "spurt" seems to have deserted the market, as no animstion at all is shown. As far as the Comstock mines are concerned, everything is being vigorously and successfully worked. The usual dividend paying mines furnish their quota this month, but this seems to have little effect on the market. From many places come news of strikes, but this news does not elevate the stocks, and in some instances has depressed them. The dullness is explained by the Virginia *Enterprise* as being due to the stringency of the money market. This has had in turn its prevailing cause in the immense shipments of bullion and coin during the last month. One reason for this transfer of coin and bullion has been the advanced premium on gold which has prevailed of late. It will be sufficient for our purpose, however, to refer to the shipments made through Wells, Fargo & Co. during the month of June.

From the 1st of June to the 29th, inclusive, silver bullion to the amount of $2,220,643 22 found its way East per Wells, Fargo & Co. alone. There were also during the same time bars of gold forwarded by them to the amount of $137,927.71. But the greatest amount by far was shipped in gold coin. This item alone amounted to $3,275,100, making, with the bullion above mentioned, the enormous amount of $5,633,670.93 sh ped during the month of June alone away from the Pacific c ast.

This drain is felt in all branches of business, and has a depressing eff ct on the stock market.

A FEW WORDS TO FEEBLE AND DELICATE WOMEN.

By R. V. Pierce, M. D., of the World's Dispensary, Buffalo, New York.

Knowing that you are subject to a great amount of suffering, that delicacy on your part has a stroog tendency to prolong, and the longer it is neglected the more yon have to ondure and the more difficult of cure your case becomes, I, as a physician, who is daily consulted by scores of your sex, desire to say to you, that I am constantly meeting with those who have been treated for their ailments for months without being benefited in the least, until they have become perfectly discouraged and have almost made up their minds never to take another dose of medicine, nor be tortured by any further treatment. They had rather die and have their suff rings ended than to live and suffer as they have. They say they are worn out by suffering and only are made worse by treatment. Of anything more discouraging, we certainly cannot conceive, and were there no more succe sful mode of treating such difficulties than that, the principles of which teach the reducing and depleting of the vital forces of the syst m, when the indications dictate a treatment directly the reverse of the one adopted for them, their case would be deplorable indeed. But lady sufferers, there is a better and far more successful plan of treatment for yon, one more in harmony with the laws and requirements of your sy tem. A harsh irritating cantic treatment and strong medicines will never cure you. If you would use rational means such as c mmon sense should dictate to every int lligent lady, take such medicine as embody the very best invigorating tonics and nervines, compounded with special reference to your delicate system. Such a happy combination you will find in my Favorite Prescription, which has received the loudest praise from thousands of your sex. Those languid tiresome sensations causing you to feel scarcely able to be on your feet or ascend a flight of stairs; that continual drain that is sapping from your systems all your former elasticity, and driving the bloom from your cheeks; that continual strain upon your vital forces that renders you irritable and fretful, may all be overcome and subdued by a persevering use of that marvelous remedy. Irregularities and obstructions to the proper workings of your systems are relieved by this mild and safe means, while periodical pains, the existence of which is a sure indication of serious disease that should not be neglected, readily yield to it, and if its use is kept up for a reasonable length of time, the special cause of these pains is permanently removed. Further light on these subjects may be obtained from my pamphlet on diseases peculiar to your sex, sent on receipt of two stamps. My Favorite Prescription is sold by druggists.—*Com.*

WOODWARD'S GARDENS embraces an Aquarium, Museum, Art Gallery, Conservatories, Tropical Houses, Menagerie, Seal Ponds and Skating Rink.

SECOND EDITION—REVISED AND ENLARGED.

The Explorers', Miners' and Metallurgists' Companion.

Comprising a Practical Exposition of the Various Departments of Exploration, Mining, Engineering, Assaying, and Metallurgy.

BY J. S. PHILLIPS, M. E.,

Of California, a Practical Operator for Thirty-four Years; Explorer, and Resident in the Pacific States and Territories for the past Eight Years.

PRICE, bound in cloth, $10.60; in leather, $12. Forwarded by mail for 50c. extra, at the MINING AND SCIENTIFIC PRESS Office, by

DEWEY & CO.

MINING AND SCIENTIF

The Editorial Excursion Party.

This party, whose prospective visit we noted a few weeks since, left New York according to programme on the 3d inst., and we have before us a dispatch informing us that they arrived at Omaha on the 6th, where a public reception and banquet was given them. They were to leave Omaha on the 8th and are expected to arrive in San Francisco on the 16th, where they will meet with a hearty welcome.

That part of their programme which remains to be fulfilled from the date of our paper to their arrival in this city is as follows:

July 11th, Sunday, Salt Lake City, attending preaching at the Mormon tabernacle; 12th, visit to American Fork canon; 13th, leave Salt Lake for Ogden; 14th, at Reno; 15th, arrive at Sacramento and remain over night; 16th, reach San Francisco 5:45 P. M., and stop at Occidental, Lick and Grand hotels. July 17th to August 12th, will be devoted to visits to Geysers, Yosemite, Big Trees, gardens, vineyards, orange groves, etc.

The names and editorial connections of the members of this party are as follows:

H. T. Williams, Ag. Ed. N. Y. *Independent*, Ed. *Ladies' Floral Cabinet* and *Horticulturist*, N. Y.; Mr. A. C. Stockin, Cor. Maine *Farmer*, Augusta, Me., *Morning Star*, Dover, N. H., and Rep. New Incorporations.

The following companies have filed certificates of incorporation in the County Clerk's Office at San Francisco:

CINCINNATI M. Co.—July 1. Location: South Fork mining district, Shasta county, California. Trustees—Wm. T. Reynolds, E. W. Roberts, R. R. Craig, Chas. J. Pillsbury and George Freeland. Capital, $10,000,000.

THE CRUSADER MINING Co.—July 7. Location—Mariposa county, California. Trustees—James A. Pritchard, A. White, F. W. Wiswell, F. L. Kreider and L. A. Raymond. Capital, $4,000,000.

NATIONAL TELEGRAPH Co.—July 7. Object, the construction, conduct and maintenance of telegraph lines between the cities of San Francisco and New York, and all other principal cities and towns in the United States and Territories thereof, and in the Dominion of Canada. The estimated length of said telegraph lines is 75,000 miles. The principal place of business of said corporation is San Francisco. The term of existence of the corporation shall be fifty years. Directors—Michael Reese, Calvin W. Kellogg, James R. Keene, Faxon D. Atherton, William Sharon, William Burling and Alfred A. Cohen. Capital, $25,000,000, divided into 250,000 shares of $100 each, and of said capital there has been at the date hereof actually subscribed $7,500,000, and ten per cent. thereof has been paid to the treasurer of the said corporation. Alfred A. Cohen is President of said corporation and William C. Ralston, Treasurer.

INCREASE OF CAPITAL STOCK.—The Rock Island G. & S. M. Co. has increased its capital stock from $2,400,000 to $10,000,000.

THE Petaluma woolen mill is in successful operation, the spinning of knitting yarn having been commenced last Wednesday.

IT seems to be an assured fact, judging from what the *Register* says, that they are to have a woolen factory at Napa.

THE entire business portion of Tulare City was destroyed by fire last Tuesday afternoon.

GRADING has commenced on the Petalnma and San Rafael railroad.

PATENTS & INVENTIONS.

A Weekly List of U. S. Patents Issued to Pacific Coast Inventors.

[FROM OFFICIAL REPORTS FOR THE MINING AND SCIENTIFIC PRESS, DEWEY & CO., PUBLISHERS AND U. S. AND FOREIGN PATENT AGENTS.]

By Special Dispatch. Dated Washington, D. C., July 6th, 1875.

UNITED STATES

Mineral Land Laws, Revised Statutes,

And Instructions and Forms Under the Same.

We have just issued a pamphlet containing the general mineral land laws of the United States, with instructions of the Commissioner of the Land Office. The contents of this pamphlet comprise all of the Government laws with relation to mineral lands of interest to the mining community, as follows: Mining Statute of May 10th, 1872, with Instructions by the Commissioner of the Land Office; Mining Statute of July 26th, 1866; Mining Statute of July 9th, 1870. Forms required under Mining Act of May 10th, 1872, as follows: Notice of Location; Request for Survey; Application for Patent; Proof of Posting Notice and Diagram of the Claim; Proof that Plat and Notice remained Posted on Claim during Time of Publication; Register's Certificate of Posting Notice for Sixty Days; Agreement of Publisher; Proof of Publication; Affidavit of $500 Improvements; Statement and Charge of Fees; Proof of Ownership and Possession in Case of Loss or absence of Mining Records; Affidavit of Citizenship; Certificate that no Suit is Pending; Power of Attorney; Protest and Adverse Claim; Non-Mineral Affidavit; Proof that no Known Veins Exist in a Placer Claim, etc. There is also given the U. S. Coal Land Law and Regulations thereunder. The work comprises thirty pages, and will be sold, post-free, for 50 cents. It should be in the hands of every one having any mining interests. DEWEY & CO.,

Publishers of MINING AND SCIENTIFIC PRESS, S. F.

N. B.—We have also added to the above publication, the REVISED STATUTES OF THE UNITED STATES, so far as relates to Mining Laws.

The Large Circulation of the MINING AND SCIENTIFIC PRESS extends throughout the mining districts of California, Nevada, Utah, Colorado, Arizona, Idaho, Montana, British Columbia and to other parts of North and South America. Established in 1860, it has long been the leading Mining Journal of the Continent. Its varied and reliable contents giving it a character popular with both its reading and advertising patrons.

Mining and Other Companies.

Bandereta Mill and Mining Company—

Location of principal place of business, San Francisco, California. Location of works, Coulterville Mining District, Mariposa County, California.

Notice is hereby given, that at a meeting of the Board of Directors, held on the 17th day of June, 1875, an assessment, No. 1, of twenty-five (25) cents per share was levied upon the capital stock of the corporation, payable immediately, in United States gold coin, to the Secretary, at the office of the company.

Any stock upon which this assessment shall remain unpaid on the 17th day of July, 1875, will be delinquent, and advertised for sale at public auction, and unless payment is made before, will be sold on Monday, the 2d day of August, 1875, to pay the delinquent assessment, together with costs of advertising and expenses of sale.

J. W. TRIPP, Secretary.

Office, room 15, No. 408 California street, San Francisco, California.

Electric Mining Company—Principal place

of business, San Francisco, State of California. Location of works, Lincoln Mining District, Butte County, State of California.

Notice is hereby given, that at a regular meeting of the Board of Directors, held on the 22d day of June, 1875, an assessment of Five cents per share was levied upon the capital stock of the corporation, payable immediately, in United States gold coin, to the Secretary, at the office of the company, in San Francisco, Cal.

Any stock upon which this assessment shall remain unpaid on the 26th day of July, 1875, will be delinquent, and advertised for sale at public auction, and unless payment is made before, will be sold on Monday, the 16th day of August, 1875, to pay the delinquent assessment, together with costs of advertising and expenses of sale.

A. B. PAUL, Secretary.

Office, No. 318 California street, San Francisco, California. Room No. 13.

Geneva Consolidated Silver Mining Com-

pany. Location of principal place of business, City and County of San Francisco, State of California. Location of works, Cherry Creek Mining District, White Pine County, State of Nevada.

NOTICE.—There are delinquent upon the following described stock, on account of assessment (No. 5) levied on the 13th day of May, 1875, the several amounts set opposite the names of the respective shareholders, as follows:

And in accordance with law, and an order of the Board of Directors, made on the 13th day of May, 1875, so many shares of each parcel of said stock as may be necessary, will be sold at public auction, at the office of the company, room 14, 302 Montgomery street, San Francisco, Cal., on Wednesday the thirtieth (30th) day of June, 1875, at the hour of 12 o'clock M., of said day, to pay said delinquent assessment thereon, together with costs of advertising and expenses of sale.

I. T. MILLIKEN, Secretary.

Office, Room 14, No. 302 Montgomery street, San Francisco, Cal.

POSTPONEMENT.—The above sale is postponed to Thursday, the 15th day of July, 1875, at same hour and place above mentioned. By order of the Board of Directors. I. T. MILLIKEN, Secretary.

San Francisco, July 7th, 1875.

Gold Mountain Mining Company—Princi-

pal place of business, San Francisco, Cal. Location of works, Lower Rancheria, Amador County, Cal.

Notice is hereby given, that at a meeting of the Board of Directors, held on the 1st day of July, 1875, an assessment (No. 4) of twenty-five cents per share was levied upon the capital stock of the corporation payable immediately, in United States gold and silver coin, to the Secretary, at the office, No. 116 Leidesdorff street, San Francisco, Cal.

Any stock upon which this assessment shall remain unpaid on the 7th day of August, 1875, will be delinquent, and advertised for sale at public auction, and unless payment is made before, will be sold on Monday, the 2d day of August, 1875, to pay the delinquent assessment, together with costs of advertising and expenses of sale.

W. A. KNAPP, Secretary.

Office—116 Leidesdorff street, San Francisco, Cal.

Morning Star Gold and Silver Mining

Company. Location of principal place of business, San Francisco, California. Location of works, Great Mogul District, Alpine County, State of California.

Notice is hereby given, that at a meeting of the Board of Directors, held on the 21st day of June, 1875, an assessment, No. 25, of one dollar (1.00) per share was levied upon the capital stock of the corporation, payable immediately, in United States gold coin, to the Secretary, at the office of the company, room 1, No. 402 Montgomery street, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 21th day of July, A. D., 1875, will be delinquent, and advertised for sale at public auction, and unless payment is made before, will be sold on Saturday, the 14th day of August, 1875, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Directors.

O. H. BOGART, Secretary.

Office, room 1, No. 402 Montgomery street, San Francisco, California.

Silver Sprout Mining Company—Principal

place of business, San Francisco, State of California. Location of works, Kearsarge Mining District, Inyo County, California.

Notice is hereby given, that at a meeting of the Board of Directors held on the third day of July, 1875, an assessment of five cents per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to the Secretary at the office of the company in San Francisco.

Any stock upon which this assessment shall remain unpaid on the tenth day of August, 1875, will be delinquent, and advertised for sale at public auction, and unless payment is made before, will be sold on Wednesday, the 1st (first) day of September, 1875, to pay the delinquent assessment, together with costs of advertising and expenses of sale. T. B. WINOARD Secretary.

Office—No. 318 California street, San Francisco, (Room No. 13.)

The California Planer and Matcher is gotten up from new patterns specially for this Coast. It has Cast Steel Slotted Cylinder Head, running in patent self oiling boxes; Matcher Sindles also of the best cast steel. The Gears are all protected with iron covers. Will plane 24 in. wide and 6 in. thick, and tongue and groove 14 in. wide. Will make rustic and stick gutters, or heavy mouldings, etc., and as the best Job Machine ever built.

☞ We have always on hand a large assortment of Planing Mill Machinery, all of the latest improvements, including Planers, Moulding, Morticing and Tenoning Machines, Band and Jig Saws, &c., &c. Send for Catalogues and prices.

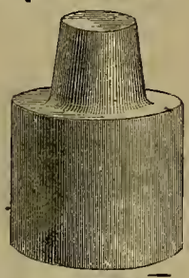
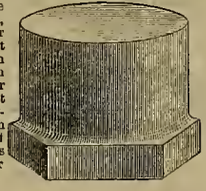
Improved Cast and Forged Steel Shoes and Dies for Quartz Mills.





[PATENTED MAY 26TH, 1874.]

Price Reduced to 16 Cents Per Pound.

San Francisco, November 10th, 1874.

To Supts. of Quartz Mills and Mining Men generally.

We take pleasure in stating that owing to the rapid increase in our orders, our Pittsburg Manufacturers have been compelled to add largely to their works—a new gas furnace and heavier trip hammer—and are thus enabled to reduce the cost of steel and at the same time produce Shoes and Dies superior to any yet manufactured. We have consequently reduced the price to 16 cents per pound and solicit a trial order, guaranteeing that you will find them at least 10 per cent. cheaper than the best iron. There are no Steel Shoes and Dies made excepting under our patent and sold at this office, or by our authorized agents, though certain Eastern manufacturers advertise Steel Shoes and Dies which are only cast iron hardened by the addition of a composition. They will not out-wear two sets of common iron, though called steel. They are very brittle and are not capable of being tempered, flying from under the hammer like cast iron. Our Steel Shoes and Dies are in use in many of the largest mills on the Pacific Coast, and all who have tried them pronounce them cheaper and far superior to iron in every respect, even at the old price of 20 cents per pound. Their advantages over iron are cheapness on first cost, increased crushing capacity, time saved in changing and in setting tappets, increased value of amalgam by absence of iron dust and chippings, and a saving of 75 per cent. in freight. It takes 60 days to fill orders from the manufactory East. Price 16 cents per pound shipped at San Francisco. Terms liberal.

☞ Address all orders, with dimensions, to

SAFE INVESTMENT.

The Pacific Coast Twelve Per Cent. Consols.

NEW METHOD WITH ASSURED ADVANTAGES.

A rapidly growing interest ie heing taken in the Pacific Coast Twelve Per Cent Consols, in consequence of tbe many advantages offered in regard to investment, interest and dividends. So much uncertainty exists in connection with nearly all mining and other speculative companies, tbere ie something very assuring in an incorporation wbich not only guarantees twelve per cent. per year to all stockholders, but provides for the bonest payment of dividende. Tbe Twelve Per Cent. Consols were incorporated on the 12th of February last, for tbe purpose of transacting a general business in buying and selling mining propertiee, city real estate, and agricultural and other lands, in the States and Territories of the Pacific Coast. Determined to do only a strictly legitimate business, the Directore rejected the old method in vogue hy mining companies generally, and adopted a new one which secures to all parties who become sbareholders, eqnal advantages in the business transacted. By the provisions of tbe by-laws,

A Sinking Fund

Is to be made of one-balf the proceeds of the total captal stock, which sball be sold on the joint account of the original co-owners. The stock will he classified as follows: Sinking Fund, mining property, city real estate and agricultural lands. Before any stock is issued in any class, the property will be appraised by the owners, and the stated value entered upon the hooks of tbe Company. Shares for not more than fifty per cent. of the valuation will be issued in any of the classes, and the amount of sharee offered for sale in any one class, exclusive of the sales of stock in the Sinking Fund, will not be allowed to exceed 50,000, if sold at less than the par value of a dollar per share,

Guarantees of Safety.

In regard to the Sinking Fund, which will constitute fifty per cent. of the par value of the stock, all moneys received as the proceeds of salee of stock on account of tbe fund will he deposited with some solvent banking institution, which pays interest on deposite invested in interest hearing stocks, honds and other securities, wbicb can he realized on in thirty days, and in no case will it be lawful for the directors or trustees to invest any moneys of the Sinking Fund in the purchaee of stocks, honds or other securities of any incorporation whatever, which shall have failed to pay interest or dividende for a period of six monthe preceding any proposed investment pertaining to tbe Sinking Fund of the Company.

Payment of Interest.

The by-laws further make poeitive provision for the payment of interest, monthly on all stock issued in each claee at the rate of twelve per cent. per annum, payable on tbe 5th day of each montb. Another important concession ie that any ebareholder has tbe option to take stock in payment for interest at par value in any claes that may be preferred. No assessment will he levied until the total stock of tbe Sinking Fund shall have been sold and paid out as provided by the by-laws. Indeed, so secure ie the plan of tbe Company that in caee the whole capital stock of the Company should be sold immediately and the Sinking Fund invested ae provided, tbe proceede would be sufficient to pay the interest for eight years and a half on the total capital stock. Perhaps no other company in the world has ever been able to present as brilliant a certainty.

Dividends.

Stockholders will not only be sure of their twelve per cent. per annum, hut will share in all the surplus profits. The dividends will be paid from the profits and salos of property, and only on ehares of consols that have been issued for property valued and entered on the books of the Company. As there can he very little question that tbe traneactions of tbo Company will be very extensive, and that the profits will rapidly reach something handsome, tbe dividend prospect should eerve ae a strong inducement to stock purchasers, for perhaps in no other direction can they he positive of receiving one per cont. a montb for money invested, and almost a certainty of large yearly dividends in addition.

A further provision can be made at any time by the Company by setting aside the percentage agreed upon of the sales of the properties of the Company. The main object of the directors is to incorporate a more legitimate and assured method of transacting business in mining and property than has bitherto obtained on thie coast. They are therefore resolved to touch nothing hut hone fide investmente, and to make it a rule to have nothing to do with speculative values. Every possible care will be taken to protect the intereste of shareholders; and in order that they may be constantly posted in the traneactione of tbo Company, a monthly statement of affaire will bo preparcd hy the officers, and the booke will he at all times open for inspection.

Sharee for the firet series iesued for mining property in Washoe, Storey and Lyon counties, and on tne Comstock lode in Nevada, and for account of Sinking Fund, will be ready for delivery to subscribers and purchasers to-morrow, at Greenbaum & Co.'s, 306 Montgomery street. Tho set selling rate will be one-twenty, and the buying rate one-nineteen. Tho principal office of the Company ie at 306 Montgomery street. T. Phelps is the President, and W. S. Reynolde the Secretary.

VOLUME XXX Number 3.

Signaling Apparatus for Railroad Trains.

Mr. A. N. Towne, the well known general superintendent of the Central Pacific railroad compsny has recently pstented through ths Scientific Paess Patent Agency, an spparatus for signaling railway trains, which is of interest to sll railroad mea. It serves not only ss a means of allowing the condnctor to signal the engineer for ordinary train purposes, hnt will automstically sound the signal in osse one or more csrs shonld hecome detached from the train, snd thns give notice to the engineer that the train has psrted.

Inside the cah, at some conveuient point, is placed a differentisl magnet, and its lower end is connected hy mesns of a wire with a battery inside or helow the cah. The armature is connected with a platina faeed screw, hy mesns of a platins faced spring, snd the screw connected with the hsttery hy a wire. The armature is also connected with the upper coils of the msgnet hy a wire. A hell hammer is attsched to the armature and s hell or gong is secured at the proper point to receive the stroke of the hell hammer, when the armature is caused to vihrate hetween the magnet and the screw. A wire leads from the hattery, passing through the tender, and thence thronph each car of the train, heing connected hy a suitahle coupling hetween each two cars. After passing through the train the wire is carried hack again and its opposite end is attached to the upper coil of the electro-magnet. A single wire, however, could he nsed and the return circuit made thronph the csr wheels and one of the rails of the track, or a steel hrush could he arranged to move along one of the rails and complete the connection.

The particular location of the wire is immaterial, but the inventor prefers to carry it thronph the train in the same location as the ordinary bell cord.

From the shove arrangement it will he evident that an elec'ric current will be msintained from the hattery thronph the train wires, msgnet, wires connected with the hattery, and wires connected with the armsture, so that that two cnrrents thus msintained will render the magnet inactive, and the armsture will be held against the screw as long as hoth curreats remsin intact; hut should the train current through the wires hecome hroken by the rupture of the wire or otherwise, the single cnrrent thronph the other wires and magnet wi'l cause the armature to vihrate between the poles of the msgnet and the screw, thus alternately making snd hreaking the conuection and causing the hell hammer to strike the hell. This action will he kept up nntil the single circuit is either permanently hroken or s double circuit again complet ed.

To connect the sections of the wire between esch two csrs, a short hrass tuhe is nsed, which is attached to one end of each section, while a short hrsss rod is sttsched to the opposite end. These rods and tuhes c.uple together by sn ordinary hayonet joint, or other simple locking joint, so thst they can he connected or disconnected. In the length of the wires is inserted a compensating spring to provide for the shortening of the wire hy contraction snd to prevent any slight disturhance hy turning curves and hy accidental strains upon the wires from interfering with its operations This spring is placed in a hrass h.rrel or cylinder and the cylinder is secured to the ceiling of the car. A spindle or rod pa.ses thronph the spirally wound spring, and this spindle has a short harrel on its inner end, against which the end of the spring hears. Inside of this short harrel is another spring which operates against a piston in the cylinder to force a short rod out through the end of the harrel.

When the spindle with its surrounding spring and short harrel is inserted into the harrel or cylinder, the p'int of the short rod will first strike the opposi:e head of the cylinder and he pressed into the hsrrel, when the end is screwed upon the opposite or other end of the harrel so as to confine the spring in the cylinder. The wire which leads from the msgnet or bsttery is cnt, and one end is attached to a screw in the permanent head of the cylinder, while the other end is secured to the spindle at the opposite end of the cylinder. The cylinder is snitahly monnted, so that the current will pass through the screw, rod snd spindle in order to pass from one wire to another.

By drawing npon the wire which is attsched to the spindle, the spring is compressed and, as a matter of course, the end of the short hsrrel is drswn sswsy from the opposite hesd of the cylinder; hnt as the harrel moves away from it, the spring in the barrel will force the rod outward and thus preserve the contact without breaking the circuit, as long as the strain on the wire through the train is not strong enough to compress the spring sufficiently to sepsrate the rod from the hesd of the cylinder.

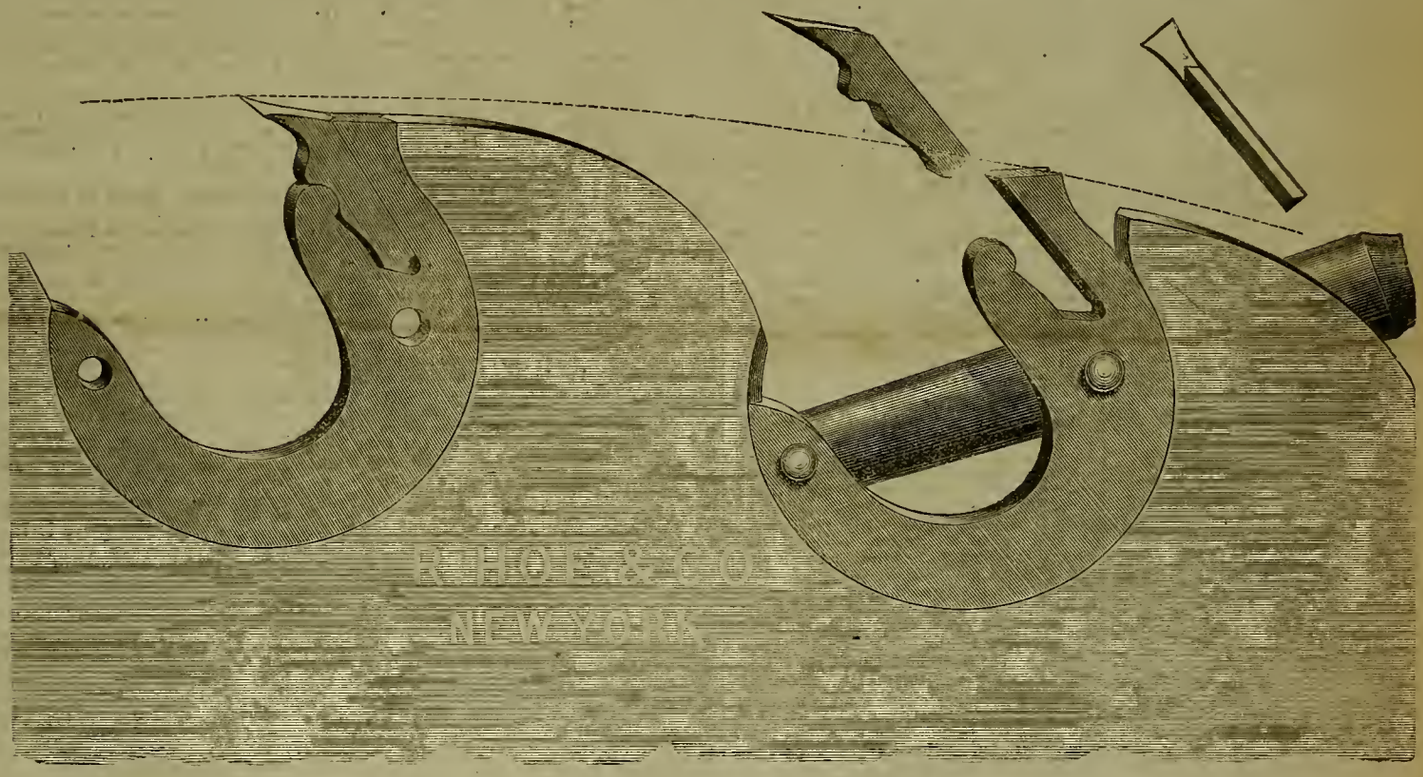
By drawing with sufficient force upon this wire the conductor can compress the spring so as to separste the rod from the head of the cylinder and thus hreak the circuit for the purpose of resign alling the engineer.

By the above described or equivalent arrsngement, an electro magnetic signal sppsrstus can he applied on railway trains which will automatically sound a signal in case one or more cars become detached from the forward portion of the train, and which will also serve for ordinary signaling purposes.

Improved Chisel Tooth Saw.

The sccompanying engraving represents a new chisel tooth saw, in which the teeth are highly tempered hits of steel, about an inch snd a quarter in length, confined securely in place without wedges. No filing is required to keep the teeth in order. They are cspshle, it is stated, of cntting 45,000 feet of lumber at an expense of not over three cents per thonsand, aud require no expert work to replace or keep them in order.

The method of removing and inserting the



HOE & CO.'S IMPROVED CHISEL TOOTH SAW.

toeth is shown on the right of the illustrstion. *E* is the wrench which is applied to the shank snd turned forwsrd sufficiently to relieve the jaw *C*, which will open and allow the tooth to come out. In the act of turning in, the projection on the inner edge of the jsw *B* closes into the depression in the front of the tooth, thus holding the latter firmly.

The first trial of this saw took place during the Cincinnati Exposition of last year. The dismeter of the tool wss 56 inches; teeth 36 inches. An osk log 16x16 was to he divided into twelve hoards and a poplar log, 20x20, into sixteen hoards. The following is the record of the saw: For oak—revolntions, 602; feed, 2¼; time, 1 m. 58 s.; nnmher of perfect hosrds, 12; horse power indicated, 98.82; square feet of lumher per minnte, 90; percentage of power used, 0.720. For poplar—revolutions, 605; feed, 3⅜; time, 2 m. 45 s.; perfect hoards, 8; imperfect, 8; horse power, 114.73; square feet of lumher per minnte, 109.1; percentage of power used, 0.689. This saw was very successful in this trial, having a higher percentage in its favor of any, in perfect hoards. It is mannfactured by Messrs. R. Hoe & Co., 504 Grand street, New York.

The new mill for the Csliforniа mine is advancing rapidly, the foundations for the machinory heing complete, wi h the exception of laying the coping stones for the engines. All the men are employed on the works than can he given room, as it is the intention of the management to complete its erection and get the mill going at the very earliest moment possihle.

All the machinery for the Lady Washington mine, on the Comstock, has now arrived except the pnmp engine, and the whole will he placed in position as soon as practicahle, the fonndations heing fully completed.

On the Glohe Consolidated mine preparations are heing made for the erecti n of new snd powerfnl pumping machinery for draining the lower levels of the mine.

At the Dayton mine, on the Comstock, the new boilers are in place; also the engines and nearly all of the other pumping and hoisting machinery.

The Albany, Oregon, sack factory is turning out sacks at the rate of 2,000 per day.

CORRESPONDENCE.

Drift Mining in Plumas and Sierra Counties

EDITORS PRESS:—The growing importance of the drifting gravel mines of Sierra and Plumas counties warrants the assumption of their being acceptable to the columns of the PRESS in a series of descriptive articles, as observed by years of practicsl experiencs as a miner and roving prospector.

Drifting or Tunneling Mines

Hold the chief place and are of paramount interest; yet qnartz and hydraulio interests are of very considerable importance.

The mines of the chief towns to be noted are Howland Flat, Gibsonville, Newark, (Whiskey Diggings,) Port Wine, Monte Cristo, Forest Oity and Allegbanytown, all lying on the great Blne lead which traverses this portion of the State in a northerly and sontherly direction. At different points of divergence are to be noted other mines of past fame and present importanoe. No better beginning can be made than to start from ths now famous town of

Forest City.

This is one of the few mining towns whose fame is of the psst and present. The town was justly celebrated for the richness of its mines as esrly as 1852. It is qnite impossible to get at anything like an accnrate statement of products or dividends, owing to the looseness in bnsiness matters of the early-day miner. We were all then satisfied if in onr little claims we got our fonr, five or six hnndred dollars per week on the investment of onr own manual lahor, and cared nothing for any data, book accounts or fignres. If our mines paid we were satisfied. As illnstrating the past valne of the mines of the plaoe I may cite as a fair example the now defunct

Live Yankee Mine.

This was as large a mine as was located on the Blue lead, thongh small compared with the amonnt of gronnd allowable to he held by a company at the present time. The location embrsced fifteen hnndred feet lengthwise of the lead by two hnndred and fifty in width, or one-half the width of the channel, making it equivalent to seven hnndred and fifty feet of the entire width and length of the lead. The prodncts of the mine were something over $800,000, and the dividends were over half a million. The general average of other mines was as great. Bnt the time came when the opened mines became comparatively exhausted and the significant assertion had obtained, the town had gone hopelessly

Down.

From 1866 to 1870 everything was on the wane. Deserted mines, deserted cabins, were everywhere met with. Population deoreased and everywhere there was a sort of sad loneliness to be met with relieved by no bright prospects. Abont this time a fire wiped ont the town, and of course the poor becsme poorer, while there were no rich to grow richer. The well nigh snppressed energy of the people bnilt up a little—as much ae the few wants of the people reqnired—hnt all was dead. The grass grew in the streets and the sportive and irrepressible gost grszed where he would, untrammeled by fence laws or city ordinances. A few gardens were planted, from which a partial snpport was derived, bnt this sort of existence wae as nnsatisfactory to an old miner as a diet of whale blubber wonld be to a Cocknsy. A few men of energy still continued to hope and nsed their meane in prospscting, which for some time produced no satiefactory resnlts.

The conrse of the channel worked had been nearly north and sonth, bnt the northern extension of it had failed to pay and it seemed as if everything was only going from bad to woree. Ahout this time

Mr. M. Redding,

To whose energy, perseverance and indnetry the town owee its present degree of prosperity, hecame thoroughly impressed with the idea that the channel, at a certain point, had come over a rim rock, forming a convergence from the northwest of what was snpposed to be the trne channel, bnt which was in reality the real ohannel. A looation of a large tract of land was made by him, a company incorporated and a tunnel etarted. A few hnndred feet were run and the work lsgged, one by one fell down and finally work wae snpended.

Another and Successful Effort.

After this no inducement conld persuade any one resident here of any valne attached to the new location. With a perseverance to overcome every obstaole, Mr. Redding repaired to Gibsonville, on the extreme northern limit of Sierra connty, and after a residence of six months' time enoceeded in forming a company of practical minere, when tbe work of prospecting the mine wae commenced, resnlting in the development of the

Celebrated Bald Mountain Mine.

The prospecting wae done by sinking a shaft from the snrface down to the bed-rock, 280 feet. Fair prospects were obtained, though nothing so good as the future of the mins verified. After this nothing remained but to run a graded tunnel 2,000 feet to tap the shaft; this was aocomplished in a year and ten months. The assessments for all purposes amounted to a little less than $20,000.

Exlent of the Mine.

By a piece of good fortune the location is as good as it could he msde if, with present knowledge, it was to do over again. The mine has a frontage of 3,600 feet end a length of one and three-fourth miles. The channel is located in the center, rnnning almost directly with its longest course.

Statislics of Workings.

Throngh the courtesy of the officers of the company, I am permitted to copy from tbe yearly reports of the secretary, snperintendent and foreman, for the past year, ending yesterday, Jnne 26th, as also all the former reports; and the secretary in addition, gave me access to books and maps, whereof I am able to speak nnderstandingly of the matter. I find that the mine has been in operation, extracting mors or less pay gravel, for three years from time of tapping shaft with tunnel. The total amount takon from the mine is $544,653.46. The superficial feet worked on the hed-rock are 539,354; paid per snperficial foot, $1; amount of dividends from mine, $284,000; amonnt of expenses, all purposes, $260,653.46; superficial feet of lesd yet to work, 6,500,000. After the assessments for running the tunnel, which were a little less than $20,000, the mine has been self-snstaining—no assessments having been levied. The first year, after paying for the opening of the works, stock, flumes, buildings, etc., a dividend of $54,000 was declared, the next year the dividends were $110,000, and the year just closed they were $120 000.

I copy from report ending Jnne 26th, 1875, the following, embracing only, however, 10⅔ months:

Amonnt taken from mine	$215,291 03
Dividends	$120,000 00
Expenses	$95,291 08
Car loads gravel of one cubic yard each	79,690
Paid per car load	$2,70
Per cent. of dividends on gross am't taken out	55 4-5
Cost per car load for every expense.	$1,19

Improvements.

The improvements to the mine sre very complete and extensive. The wasbing flume is one and a fourth miles long, and a lsrge portion laid with iron riffles. At the lower end of the flnme are the tailing claims of the company, which are 8,000 feet in length. Two large dnmp yards, donble planked, of a capsoity of 30,000 cnbio yards, reservoirs, ditches and flumes, timber houses, store room and shops, make the outside fittings as complete as oould he desired.

The openings to the mine are of the most approved modern plan and of large extent, showing snfficient pay gravel in sight for years of work. The nniformity and richness of psy is something remsrkable, and I think fully warrants the belief of this being one of the very best drifting mines on the coast.

Other Mines.

Several other mines loosted here are giving signs of promise and importance, the chief of whicb ars the Sonth Fork oompany, lying to the sonth, and the North Fork oompany, lying to the northwest of the Bald Monntain company. In the former the pay ohsnnel is reached by tunnel, bnt nnfortunately the tnnnel is too high to drain the ground. This will necessitate the running of a new tnnnel at a lsrge outlay, but as the gronnd is deemed rich final success is only a question of time. The location ie a large one, very favorably situated, and with tbe drawbaoks ennmerated is still held ot growing value.

The North Fork Company

Hss its mine opened also hy tunnel, which hss just tapped the pay channel on the outer rim; the tnnnel is in over 3,000 feet. Mr. Spaulding, enperintendent, and a large stook owner, is a mining engineer of long residence here, well posted in the workings of the adjoining locatione and the richness of the lead as worked to the boundry line of their mine, and deems the prospects already obtained enfficient to warrant the oomplete enccess of the mine in the near future. This opinion is generally concurred in by many old miners, long resident here, who took all the stock at home.

Wild Cal.

This place is not an exception to other towns where rich mines have been found; at every point of the compass at distances of one, two, or three milee are locations all claimed to he directly on the Bald Monntain lesd. Corporatione are formed, assesements levied, and money squandered, without a ghost of a show of finding anything. It is amusing as well as sad to see the frantio efforts of some to twist and contort the channel so as to make it pase directly through their locations.

The local press oan, it seems, always be had to talk these thinge np for a consideration. Not long since a correspondent, writing one of these "felines" up, stated that it wae just opposite the Bald Monntain mine and directly on its lead, while the facts were the location was nearly four milee away with high bed-rock ridgee intervening. Another case wae where a location was made to the esst of the Bald Mountain hnt not deemed by practical miners of any importance. It was desired that the ownere of the Bald Monntain company should give the thing a lift, and becanse they could not conscientiously do so, it was the cause of a small editorial supposed to be a orusher, the secret of which was the editorial ownership in the land and a speculative turn of mind, where no particular effort is requlred, which proposed to let soms poor bnt honest miner who had plenty of oredsnce and soms money, bscome the happy owner of a rioh mine—on paper.

This thing is all wrong, and does more to injure legitimate mining than all other canses combined. The day is well past for the reckless hap-hazsrd mining of former times. Every dollar invested in opening these wild cat mines is so mnch thrown away, while for legitimate mining enterprise based on practical common sense the field of operations is expanding.

PRACTICE.

Forest City, June 27th, 1875.

Mining at Bingham, Utah.

EDITORS PRESS:—After long delay, I again take my pen to inform yon of the oondition of mining matters in Bingham, Utah. Wishing to present a more cheering aspeot than has existed for a few months past I have waited, hoping to present a better showing. But several canses have combined to produce an unmistakable stagnation here at present, which, however, can only be temporary. Active measurss are now in operation by which the cost of fuel will he redueed to one-half its present price, and the purchase money retained in the Territory to stimulate our own enterprises. Our ores being mostly of the smelting character the cost of fuel is of vital importance. One canse of the depressed coudition of our mining prosperity is one that Californians learned many yesrs ago by dearly bought experience, viz., that kid gloved gentlemen having little or no knowledge of mines or mining, and who can hardly tell the difference on sight between a piece of ore and a lump of soap stone, oannot be trusted with the management of mines with reasonable hopes of success. An editorial remark in the PRESS a short time sinoe is here verified to the fullest extent, that the causes of failure are often not so mnch owing to the character of the mines as to their had management. Hnndreds of mines in the Golden State, which wrecked their owners years ago from that oause, and since proved to he rich, attest the truth of the observation. In all other ocoupations men are employed with a dne regard to their fituess for the work to be accomplished, but the rule is disregarded here, as formerly in Oalifornia, and the resnlt, already upon us, is the ssme. In one instance one of these gentlemen run a tunnel one hnndred snd fifty feet to strike a vein thirty or forty feet dèep, at considerahle expense, when with the same force he conld have made the ssme depth from the snrface in ten days! Another knew so little abont practical operations as to direot his men who were driving a drill to strike "winding licks" and when the hole was once started the drill wonld tnrn itself. In msny instances a vast amonnt of "dead work," snoh as tracing the lode, making roads, building ore houses, making chutes, etc., has been done before ascertsining the prodnctiveness of the mine. With the same consistency yon might send a landsman outside the Golden Gate to pilot a ship into port. Mines from which the owners might he receiving satisfactory dividends under efficient management are exhausted hy the continnal ory of the superintendent for more money. "Experience teaches a dear school, hut fools will learn in no other." Shrewd and practical men are taking advantage of the present lethargy by hnying np minee at a song's valne, greatly to their own gain and the future prosperity of the country.

But enongh of growling, yon will say, for one communication, so, *per contra*, I will mention a peonliarity not often observed, that will he interesting to copper miners. Two of our minee of most note which have attained the greatest depth are gradnally changing into copper ore. The "Neptune" which hae an ore body of thirty-five feet or thereahouts, strnck a body of the latter ore lying on one side of the argentiferous galena, which has constantly widened ont to ten feet or more in width, and assaying thirty-five or forty per cent.; from present appearances it will entirely supplant the other character of ore. The "West Jordan" is showing abont the same condition, other mines which have reached considerable depth give evidence of the same result, and it is not improbable that instesd of lead and eilver being our staple prodnote, our district will rank high ae a copper prodncing region. In oonclusion I will say that for readiness of development, amonnt of ore, and certsinty of remuneration to judioione investment coupled with economical and energetic management, no mining district offers greater inducements than thie.

WILLIAM TEAL.

Bingham, June 30th, 1875.

THE Cosmos of Humboldt tells of the trend of mountain chaine, configuration of coast ranges, river baeins, steppes and continuity of currente of air and oceans. The great physical geographer saw these grand features duplicated in the continents; yet a little reflection will tell ns that if law ie in the trend of a mountain range, it mnst also exist in the smallest ridge.

STEERING BALLOONS.—Some interesting experimente have been made at Woolwich, in steering balloons for military purposes. The halloone were gnided buokward and forward in any desired direction, by Mr. Menier, the inventor, in a still atmosphere. The valne of the invention will, however, depend greatly npon its snccess in currents of wind.

The Bonanza.

Last Saturday night a reporter of the *Evening Chronicle* saw a piece of "barren rock" fonnd in the Oonsolidated Virginia mine. It was taken from the second sill floor on the 1500-foot level, by Frank Osbiston, ths well-known expert, during a visit two or three days previously. It weighed just 8¾ ponnds, and according to the assays was worth $13.91. Two assays were made from this piece of barren rock, which resnlted as follows: Assay No. 1—$3,184.41 per ton; assay No. 2—$3,170.37 per ton. Abont one-third of the prodnct gold.

"Yon see this littls ribbon," said Mr. Osbiston, holding up a gleaming little band of silver, about fivs inches long, half an Inch wide, and ahont twice the thickness of letter paper; "this came from a quarter of an onnce of that ore."

The piece of rock was little more than half the size of a brick, but it was cloudy with black sulphnrets, and here and there bnnches of stephanite nestled snnggly in little cavities. Mr. Oshiston, it will be remsmhered, was one of those who six or seven months ago deolared the Consolidsted Virginia mine to be worth $1,000 per share at least. The reporter asksd if he thonght so yet.

"I am more firmly convinced of its value now than I ever was before," he replied. "The developments made within the last six months have simply demonstrated to svery one what mining men were already satisfied of—that the ore deposit is rich and extensive beyond anything dreamed of before. A winze sunk 205 feet below the 1500-foot level is in rioh ore all the way down, and there is no sign yet of the ors pinching ont."

"Then yon don't think there is any immsdiate prospect of working the mine out?" inquired the reporter.

The sxpert laughed dryly as he replied: "Well, no, I don't. Yon see that room there?" pointing to an apartment abont twenty-five feet square, "well, the space worked out in that bonanza bears about the same proportion to what is left as that room does to this whole block."

From tho report of Mr. Osbiston, which is corrohorated by all who have lately visited the mine, the absurdity of the bearing stories circulated in San Francisco will be apparent.—*Virginia City Chronicle.*

New Smelting Works in Colorado.

Golden, according to the *Transcript*, from which we condense as follows, is to have smelting works on a grand scale:

The Colorado ore dressing and smelting company was organized in Jannary last, under the laws of Colorado, with John Collom, Bradford H. Locke, Daniel Peters, William Hancock and Peter W. Crozer as incorporators, the capital stock being fixed at $250,000, divided into 2,500 shares of $100 each. The Eastern office has been established at Trenton, New Jersey, and the Western office at Golden, Colorado.

The object of this company is to nndertake the business heretofore pursned by the Idaho ore dressing company, at Idaho, and the Black Hawk ore dressing company, at Black Hawk, and to add thereto ore dressing works at Georgetown and smelting works in Golden, the whole to he merged into one organization and conducted nnder one general manager, whose headquarters have been established in Golden.

Collom's oncentration works, located at Iduho, and worth some $75,000, ie the oldest establishment owned hy this oompany. Its capaoity ie seventy-five tons per day, and ite success in the lins of ore dressing is already established.

Next in order of date comes the Keith or Mammoth mill, at Black Hawk, with a capacity of 125 tons per day, and worth in the neighborhood of $100,000.

The Georgetown works will oost, when completed, about $40,000. The capacity will he 100 tons per day.

The site for the company smelting works in Golden ie located on the Colorado Central, near the mouth of Olear Creek canon, and withln 400 feet of the Golden colliery. The huildings will be of brick, the main one to be 150 feet by 60, and to contain two reverberatory roasting furnaces, and two roasting cylinders. The building now erected, and whioh ie 50 by 30 feet, will be nsed for part of the process, and may, at eome fnture time, form the nuolens of separating works.

AMARYNTH.—The Amarynth mine, located on Cherry creek, near the Goodrich mine, owned by Messrs. Whaley, Traner, Parmlee and J. H. Johnson, ie represented as looking well. Four miners are employed on the mine, and a large pile of gold hearing quartz is already extracted. Two of the owners who were in after supplies on Snnday, were eo excited over the prospects that they conld not content themselves away from the camp yesterday, and celebrated the day taking ont ore.—*Silver State.*

A MILL FOR THE GOODRICH.—A. E. Goodrich, President of the Transportation company, Chicago, who owns one-half of the Goodrich mine, in Sierra district, writes Capt. Comins, his partner in the mine, that he has ordered a ten-stamp mill, and will ehip the eame ahont the 20th of thie month. The certainty of a mill heing erected on the Goodrich at an early day has stimnlated the owners of mines in that vioinity to inoreessd activity, and half a dozen oompanies are now at work within half a mile of the Goodrich.—*Silver State,*

Scientific Progress.

Solar Heat—A Popular Fallacy.

Science is sometimes unsecured by practice. Ericson spent a fortuoe in sxperiments with hot air as a motive power. His science was all right, but practically his system would not work to profit. Tho sams excellent mechanical scieati:t wasted time and money in trying to utilize the concentrated rays of the sun, in place of fuel, for geaerating steam power.

Having properly proved that in u small burning-glass tbe snn's rays set combustibles on fire, he took it for grauted tbat a larger glass would do greeter execution io proportion to its focal enlargement. It is proved in practice thet however large the lens, two inchee or two feet, only the same burniog power can be realized. He was so sure of his theory, thst he made, at greet expense, u four-foot lens so nconrarely conetructed as to secure a great concentration of the sun's rays. He calouloted on smeltiag irou and rebellious ores. But he found his science at fault. His pocket lens was qnite es effective. Whatever be the neturo of the sun'a heat, it differs materially from ordinery fire. Yonr highest monntain tops are aeurest to the sun, yet they are colder then the plains which are more remote, and oe we go yet farther in deop mines the tempereture increeses.

It would seem tbet the sun's hest reaches the plunts in a latent s'ate and becomes sensible by connection with our utmosphere. By such an arrangement, the remoteness of e planet does not determine the proportion of heut it receives. It may he equnlized by the constitution of its utmosphere. This essumption would remove maay embarrasements to scientific inquiry regurding life on the exterior planets, whioh else would appear to be too cold for nuy form of life, of which our bodiea afford any conception. They have atmospheres vieible to us, end this esteblishes analogy, thongh does not identify hetween the systems of life in all the worlds which derive their meens of life from the same central source.

The Missino Link—Perhaps.—If we are to believe a report from the Madrus Preeidency, one et leaet of the missing links hetween the enthropomorphous apee and *Homo sapiens* has at lust turned up, a Mr. Bond, un Indian surveyor, heviag, it is said, secured two specimens of u race possessiag some very simiun characteristios who inhebit the hill jnngles of the Western Ghats, living chiefly on roots and honey, and being without fixed dwelling places. They heve, however, civilized tendencies, for they exchange honey, wax and other prodnce of their forest haunts, for tobecco, as well us for cloth and rice. Tho diagnosis of this remarkable and primitive type of humanity is very interesting. The forehead is low and retreating, und the lower part of the face projecting like the muzzle of the monkey; the legs ere short and bandy, while the body and arme are comparetively long. The most striking oharacter is in the hands, whioh, with the fingers, are contracted so that they oannot be etretched out flat; the palms and fingers, more especially the tips of the latter, are covered with thick akio, the nails being emall aud imperfect, while the feet are hroad und covered on the upper as well ae the lower surface with thick skin. Thsse people are not without religion, practieing, apparently, a species of nature worship. The monntaine of India herbor severel very anoient reces, who have there found a refuge from the euccessive waves of invasion, which, as in the case of Italy, have swept over the peninsulu from prehistoric periods, and whoee strange and primitive customs and habits huve already thrown light upon important ethnological problems.

Straiohtenino Tall Chimneys—Our reedere will very generully remember the plan adopted for straightening a tall chimney near Edinburgh, Scotland, hy sewing away a portion of the mortar upon the leaning side. Following is another plan adopted for the ssme purpose at another loeality: A high factory ohimney in Havre, which dnring the process of hnildiug hed, owing to the sinking of one side of its fonndation, heen thrown out of perpendicular, wae recently streightened in the following manner: The earth on the eide opposite that townrd which the chimney inolined was dug away to the fonndation bed, and for a width of six feet. On the wide lower oourse pillars of masonry were ereoted, which snpported a heavy staging, on which some 30,000 paving stones were piled. The effect of thie immense load wes to cause a einking of the etructure heneath, which, in six weeks, resulted in the straightening of the chimney, the top having peseed through an ero of thirty-one inchee.

Scientific Preemium.—Urieh A. Boyden, of Boston, Mass., has deposited with the Franklin Institute the sum of one thoueand dollars, to be awarded as a premium to "any reeident of North America who shull determiue by experiment whether ull rays of light, end other physicel rays, are or are not transmitted with the seme velocity."

Preservation of Metallio Sodium.—According to Bottger, if eodium be placed in alcohol until its surfeoe becomes brilliant, and then in naphthalic ether chemicelly pure, end finelly in a oneentrated solution of nephthalic ether, the metal may be preeerved unalterable with its luster unimpaired, for a long time.

A New Use of the Sand Blast.—The prodocing, upon pleted ware or silver, of a lusterless, very finely grained surfece, termed by the trede satin fioish, has heretofore been eccomplished by the use of swiftly rotatiag broshes made of fine wire. Messrs. Simpson, Hull & Co., of Wallingford, Coun., have recently found that the sand blast performs tbis stippling work much more rapidly snd effectoelly, aud have introduced the necessary apparatos for its employment in their large silver-plate manufictnring establishment. From Mr. W. E. Hawkins a gentleman connected with the above concern, we learn, says tho *Scientific American*, that air is compressed by the driving eagine of the works into an ordinery reservoir, end theuce distrihuted through pipes which extend along the front of the workmen'e tebles: and ebovo the latter is e sand receptacle, V-shaped, from which a stream of eand fnlle und is met by a downward hlast from the pipe, whlch current drivee the muterial in a stream through u emell hole in the table, heneath which a reccptacle to receive the sund ie placed. The workman, whose fingers are covered with rubber to protect them, holds the article in the jet and under the table, watching it through u pane of glass let into the top of the latter. Tho operation is neceesarily very repid, ae the article has only to be turned so that the blaet strikes the reqnired portions, when the work is compleeted.

Tho exposure to the jet, even for an instant, would cut through the Britannis, upon which the plating is utterward deposited. By the interposition of rubber screens of suitable shape, against whioh the ssnd hes no abrading effect, any fancy petterae or letters are easily imprinted on the surface, the latter of course being satiu finished, while the epaces protected hy the screens are afterward burnished. The screene or patterns ere cut out by girls, of whom numbers are employed for tbut purpose.

Discovear of the Phylloxera Remedy.—M. Dumas recently anuounced to the French Acndemy of Sciencee that a mode of treating vines attacked hy the phylloxera has been discovered, which is certain in its resnlte in destroying the insect and in restoring the vine to health and fecuadity. The remedy is the comhined employment of sulpho-carbonate of potseh, which kille the ineect et any depth, to the soil, and of potassio, ammoniacal, and sulphuretted manures. *Les Mondes* states thut M. Damae himself is the fortnnate discoverer, though his annoncement to the Academy was not made until sfter his process had been tried hy exhaustive experimenting by the commiesion appointed to examine into the various plane eubmitted. Thie being the case M. Dnmas hecomes the possessor of the $60,000 reward, beside the numberless other prizes of smaller eums offered throughout France.

Maonets for Electro-Motors.—Magnets or armatures for electro-motors may he eoftened as follows: Heut the iron to an even dnll red heet all over; and if the eurface of the iron hes not been faced off in a muchine, lightly file it to remove the scale, and then immerse it in common soft soap, allowing it to remein therein until it is quite cold. Then reheat the magnet to an even red heat whose redness is harely perceptible, end hury it in pulverized lime, wherein it mnst also remain nntil quite cold, whcn the metal will be found ee soft as it is poseible to make it, and the blade of an ordinary penknife will cut it. At the second heating the iron will emit a light blue fleme, showing the effect of the immersion in the soft soap. The conductibility of the msgnet may be, hy this process, very much increased.

All the water in the mineral fields, rivers, lakes, springe and ponds, has direct reference to the filling of the vein syetem. The hed-rock of the creeke around the iroo mountains of Missouri is impervious, and radiatee the rnin water from the ore depo.its, so that when the excavations are carried deep the ore is found in comparatively "dry gronnd." The same law apphes to the three little pilot knohs that mark the center of the lead fields of Southeast Missouri, and the Plette mounde that mark the center of the great hasin of the Wisconsin or upper Mississippi lead field. Each drop of water that falls or circulates in the strate or on the surface, flows with direct reference to the hasin system and oro deposite of these mineral fields.

How does a Spider Make its Web?—Here ie e poser put by a writer in *Science Gossip*, which eome of our renders, who have watched the huhits of spidere, may he ahle to answer: How does a spider make ita weh, the lines of which, crossing at the center, ere carried, some of them, to the surrounding objects, while others are fustened to un outer circular line, made evidently hefore the outer circular lines of the woof are formed? Wher. doee tho spider place itself when it ejects the lines which form the spokes of the wheel?

Recordino Speech Automatically.—A machine for writing epoken worde hae heen inveuted by a Frenchman named M. H. Hupdinger. The *Revue Industrielle* describes the machine as being ahout the size of the hand. It is put in connection with the vocal organs—the inetrument recording their movements upon a moving band of peper in dots and daehes. The person to whom the instrument is attaohed eimply repeats the words of the speaker after him inaudibly. This lip langnage ie then faithfully written out.

Mechanical Progress.

Re-Carbonizing of Steel.

A series of novel experiments has recently been mede in the re-carbooiziog of steel, ths result boing in every detail highly setisfactory. The Cardiff eogine works was tbs sceoe of the experiments, eud tbe process of re-carbonizing the steel wes Introdoced hy Mr. D. Drummond, of Swansee. Tbe meterial used is e neerly liquid composition, and Mr. Drommond simply placed it in the hands of the foreman of Messrs. Elliott & Jeffrey, the proprietore of the works, with instructions how to use It. We will give one of the experiments. A oommon chisel, in use for chipping rivet heads, was placed in one of ths smithe' forges and heeted until it was burut. Thie wus repeated three times, until it wus rendered quite useless for any purpose whatever. It wee then placed in the composition, tempered in the ueual wny, und gronnd on the side of an old anvil, und violently strnck with u chipping hummer. A piece of cbilled iron was then cut, the edge of the chisel remaining intact, to the aetonishment of the onlookere. Mr. John Elliott, of the Cardiff engine works, expressed his opinion, as e practical engineer, that the experiment wus a thorough enccess. Mr. George D. Dalglish, mining engineer, Pencoed, and several of the officials of the Powell Doffryn colliery company, also expressed a similer opinion. The composition has the wonderful property of making bad eteel good, nnd good steel nearly impregnehle. An employer has only to get a tin of the compound, prepare the ontting portion of the chisel, or turniag tool, from inferior eteel, nnd it will stand as well us if the tool had been made from the best eteel; or if the best material is used, the tools will lsst for a surpiisingly long period. The composition, we have been informed, was tried at Brynacae colliery last week, in the presence of Messrs. Dunn end Francis, mining engineers. A steel set chisel was treated in the usual way. A sixteen ponnd sledge hammer then drove it through a two inch bar without turning the edge. Two chiesls were subsequently made by Mr. Dunn's order out of one har of eteel, one of the chisele being treated by Mr. Drummond's mixture, and the other being tempered in the usual wuy. The latter, after cuttiag a hole six inches in depth, was quite unfit for use, whereas the other cut five holes of varions depths, from six inches to three feet six inches, and wus then none the worse of the weer.—*Ironmonger*.

Hydraulic Riveting Machine.—An Englieh riveting mechine of recent construction shows some features of mechanical interest. It conaists of two iron girders, each twelve feet long, and hinged together in the center as they stand upright. One is fixed firmly, end the other moves slightly on a pivot. Bnilt into the base of the fixed girder are two hydraulic cylindere, and by short arme their pistons ure connected with the end of the other girder. The first turn of the starting wheel applies the power of the emaller of these cylinders. It hes snfficient force to move the lever into place against the rivet in the plete that is stending between the two girders at the top. The next turn brings in the power of the larger cylinder, and a squeezing pressure of sixty tons drives the rivet home. A reversal of the hsnd wheel allows both cylinders to empty themselves, end the pressure is removed. The same motion also gives the water to the smaller cylinder, and its reverse motion draws the girder back into place. By the use of sliding jaws, thie machine is also used in bending plates snd heams, end may be worked up to a power of 120 tons. The hydranlio works, being below the floor, are safe from dust and frost, aud conveniently out of the way.

Artificial Hardening of Sandstone.—Msnfred Lewin has tried with success in his quarries at Saxonia, and at Neundorf, near Pirnu, a process of impregnating sandstone. The stone there quarried ie poroue und readily absorbs water to a certein depth; it ie this fact which renders it possible to introduce a solution to harden the surface. Lewin impregnetes the stone with solntione of an alkuline silicate and of alumine; there is thns formed an elumininm silicete within its pores, whioh gives to the surface considerable reeistance. The eolutions employed are mede with solnhle glass and with alnminnm snlphate. After the impregnetion, the sandstone may he polished like marhle, which it then resembles closely. Heated to a high temperature, the exterior leyer vitrifies and thus may be colored at pleasure. The coloration may even he obtained simply by mixing the desired pigment with one of the two solutions used for the impregnation.

The weakest point in a hoiler is where it is riveted. If a boiler could he made entirely of welded iron, without rivets, it would he one-third stronger. Tbe smeller the boiler, the stronger it is. A boiler twenty-four inches in diameter will stend twice the pressnre that a boiler forty-eight inches in diameter can, of the same thioknese of iron, or three times the pressure that a hoiler seventy-two inches in diemeter can stand.

It is steted that the vessel in which is stored the power of the Keeley motor, is made without a riveted seem, the joints belng welded. How this hae been doue is as muoh a mystery as the pretended motor itself—and probably there is as little fect in ths ons as the other.

Lining Boilers With Copper.

M. F. Pupka, a Visnnese enginser, givss the following fects regarding experiments in linlng steem hoilers with sheets of oopper in order to hlndsr incrnststion: Of the thres pletes which formed the bottom of a locomotive boiler, the two et the ends were covered with e sheet of copper 0.04 inch in thickness, the middle one heing left bare. The machlne wss ussd steadily for two ysars in districts where the watsr is of excessively bed quality. On removing the tobes a layer of iacrustation fonr inches thick was found on the iron surface, while a deposlt varying from only 0.08 to 0.12 inch thick appeared on the copper. The iron also was corroded in meoy places to a depth of 0.02 inch, but the copper had remained perfectly clean und bright. The texture of the incrustations showed larger grains on the iron then on the copper.

Another engineer, who exsmined and reported on the arrangement, says that the duration of the boilere is doubled or triplsd by ths applicetion of the copper plutes. which afford extreordinsry secnrity ugainet explosion. The incrustation is much less ou copper than on iron or steel, whieh is porons end slightly oxidized, and coneequently the vsporizetion is more complete, and there is a correeponding saving of fuel. In the construction of a boiler to be lined with copper the iron plates may be of less thickness without riek; the weight of the boiler is thus considerably reduced, and, lastly, the expense for repairs is oonsiderably diminished. We have, howsver, to consider the galvunic effect of the contact of the two metals, und require reports on other waters less calcareous, but more acid, than the one alluded to ebove as of "very bad quelity."

A Novel Mechanioal Appliance.—Severel yeare ago the famous obelisk, known es Oleopatra'e Needle, was donated by the Egyptian to the Britieh Government, hut the lutter, although severel plane have heen proposed, has heretofore considered no scheme as overcoming the engineering difficulties of removing the monolith from its site to the shore and thence to England. We learn from the London *Times* thet an attempt is now ehortly to he made, aad the project which has been edopted is as follows: The obelisk is to be encased in wood, by attaching heavy besms, strongly connected together to each face, nntil the desired cylindrical form is obtained. It will not he difficult then to roll the monument over a wooden road, laid over the sand hills which cover the intervening mile hetween its present loeetion and the sea. The wooden envelope, while increasing the mass, will, et the same time, he ench as to diminish the specific gravity of the whole, so that the grest bundle will readily float. To this end, the diameter of the circle formed by a section of the cylinder will he twenty feet, or twelve feet larger than the bresdth of the sides of the obelisk. After the monnment is launched, it will he towed out of the Mediterraneen and into the Themes, to the nearest point to ite future site. This plan, it is helieved, can be oarried ont very easily und with little expense, while it will be free from the dangers found in treneportiog the Obelisk of Luxor to Paris, es during its voyage tbat mouument seriously demaged the vessel.

The First Planino Maohine.—It is en interesting queetion ns to where the first planing machine wss made; according to the London *Iron Trade Exchange* it was built in the Holland etreet works of John Rennie the elder. "In March, 1814, (and we copy from an original memorendum hook of the late George Rennie,) the following plan was adopted for chipping the osst-iron sides of a new lathe. The sides are placed close together, with their feces upward; two planks of elm, one on esoh side, are bolted with their edgee trnly placed end upward; upon the edges of the planke run four wheels on axles, which support a truck of oak. To the truck is fixed a slide-rest, to which is attaohed u cutting tool; the trnck is well loeded with weights, and pulled along ths surfece of the elm planks by mesns of a orab and ohain. Thus the tool planes the iron lethe hed straight," This was, in fact, the first plening machine, crude and rnde as it was, and from it Whitworth, to whom the original apparatus wes shown, subsequently mede a self-eoting machine. We all know how important a tool it has hecome in the manufecture of neerly every kind of mechinery.

Iron Wire, tinned by a galvanic process, end haviug the appearance of hright eilver, is being introduoed. The wire is first placed in a hath of hydrochloric acid, in which a piece of ziuc is euspended. It is then placed in oontact with a piece of zinc in u hath of 100 parts water, two perts tartario ecid, three parts tin salt, and three parts soda. In about two hours t may he taken out and made bright by drewing through a polishing iron.

Rifling a steem jet to give it a spirel motion is now performed hy inserting three small pipes into the oloeed head of a delivery pipe. These pipes are then given half a turn eech, and the ends hronght together. In cleening fines, this triple nozzle gives three jete, eaoh having a spiral or twisting motion that causes them to strike the walls of ths flue, and effectuelly sweep them olean.

Theee are nearly 400,000 cars running on the rullroads of the United Stetes, supportsd by neerly 4,000,000 cast iron whsels.

Mining Summary.

THE following is mostly condensed from journals published in the interior, in proximity to the mines mentioned

California.

ALAMEDA.

COAL.—Livermore *Enterprise*, July 10: Quite a large quantity of Livermore coal has been shipped the past week. We understand the committee on the purchase of machinery are meeting with good success in securing the same for the mine. The shaft has now reached the 400-ft level, and preparations are being made to commence stoping, east and west, immediately. During the last 30 feet the quality of coal has materially improved, and is now considered without fault.

AMADOR.

RICH STRIKE.—Foothill *Ensign*, July 10: We are told on trustworthy authority that about three weeks ago, as two men, whose names we have been unable to learn, were cleaning out a spring, some 3 or 4 miles above Volcano, they exposed a quartz lead. They at once set to work upon it, and in a few days took out 30 tons of rock, which was sent to the nearest mill to be crushed. The result realized the snug sum of $1,700. We understand that parties in Sacramento have endeavored to purchase the claim, but the owners refuse to sell. The party to whom we are indebted for this information visited the locality a week ago, and reports the ground on the line of the lead taken up for a considerable distance. We have not been able to obtain confirmatory testimony to the truth of the above, but have no reason to question its credibility.

ORIGINAL AMADOR MINE.—This mine, situated at Amador City, is now running 20 stamps; crushing between 20 and 30 tons a day. It employs about 70 men altogether.

KEYSTONE MINE.—We understand that a new shaft is being sunk on this mine, on the east side of the old works, for the purpose of facilitating the taking out of ore. New hoisting works are in course of erection, the lumber for which is being supplied by G. Allen, and the requisite castings are furnished by the Sutter Creek foundries.

VOLCANO.—Cor. Amador *Dispatch*, July 8: The Modoc company made a run of 23 tons of rock and cleaned up $1,384, with plenty of rock in sight. McQuade & Co. are still at work on the extension of the Modoc lead, with flattering prospects. Griesback & Co., on Pioneer creek, have had a lot of rock crushed with satisfactory results. Rodgers & Co., near Fort Ann, have completed their hoisting works and are engaged in sinking the shaft, being now down 150 ft, with a ledge 2½ ft wide, the rock paying $30 per ton. Mr. Poundstone will be at work in a short time on two leads near Fort Ann that prospect well. There are other companies prospecting; will let you know the result some other time. Robinson & Co. in their placer claim cleaned up last week about $1,500. McLaine & Co. are running their tunnel ahead. S. Bono & Co. are drifting out dirt that prospects well. Mr. Potter is tearing down the old Tulloch mill and machinery, to put in new machinery, and intends having it running by the 1st of September. Mr. Pine has gone below to purchase machinery to erect hoisting works at his mine on the Mokelumne river. Work is being rapidly pushed on the Rising Sun mine, which looks well; the lead is about 12 ft wide and is rich in paying sulphurets.

GWIN MINE.—Calaveras *Chronicle*, July 10: Sinking for the 1100-ft level has been commenced in the Gwin mine, and the work is being rapidly pushed ahead. But little rock has yet been taken from the 1000-ft levels, the 900-ft stopes having furnished the batteries with an abundance of ore up to the present time. The ledge shows remarkably well in the 1000-ft level—wide and rich—and it is thought that the stopes, which are now well opened, will supply quartz enough to keep the mills in constant operation for a year. The new sinking will be completed in a short time and the necessary levels run, the object being to keep at least a year's supply of rock uncovered ahead of the stamps. The prospects of the mine are as flattering as could be desired.

ALPINE.

LOCAL ITEMS.—Alpine *Chronicle*, July 10: The assessment roll of this county foots up $494,944, a decrease of $358,118 compared with last year's roll. This light roll is due to a stagnation in the wood business, and the throwing of several of our mines into litigation—drawbacks that will not be known hereafter. If the mining enterprises now getting into shape are fully inaugurated, the assessment roll of Alpine in '76 will foot up not less than $1,000,000, and the county be in a better position than it has been since the flush times of 1864 and 1865.

This week U. S. Deputy Surveyor Hawkins has been engaged in surveying the Imperial claim at Bullions, application for a U. S. patent having been made.

The Morning Star company have also applied for a patent for their mine at Mogul, and on Monday last U. S. Deputy Surveyor Craven, of San Francisco, arrived at Monitor and surveyed the mine. He also surveyed the Marton claim and mill site for the same purpose.

U. S. Surveyor General Stratton has appointed L. L. Hawkins U. S. Deputy Surveyor for Alpine county, An acceptable appointment.

CONTRA COSTA.

PREPARING TO GRIND IT.—Contra Costa *Gazette*, July 10: Mr. Warren Brown has by this time probably got his arrastra at Layfaette ready for operation, and will put it to grinding the several varieties of rock found in that vicinity which are known or supposed to contain gold and silver. The arrastra will be operated by the steam power of the flour mill, and by working a ton or two of the several varieties of rock will practically test their value.

LAKE.

FURNACE ALTERED.—Lake Co. *Bee*, July 8: The Mt. Jackson furnace stopped worked last week. It will be altered to a continuous furnace. While the alterations are in progress a bench of three retorts will probably be erected for reducing the high grade ore. Thirteen men are at work in the tunnels, taking out only the dirt that lies in the way. Enough good ore is now in sight to run the furnace a year.

NAPA.

PHŒNIX.—Napa *Register*, July 10: We had the pleasure of meeting J. H. Cowan, of the Phœnix mine, on Thursday last. He tells us that they commenced charging their furnaces on Sunday. The furnaces seem to be working exceedingly well, the recent improvements having been of great benefit. The ore coming out now is very fair, with an abundant supply on hand for this summer. They are making about 20 tons of adobes daily; half of which are being used with rock now. The Washington mine is also running, with a fair showing. The Oat Hill district, north of the Phœnix about two and a half miles, is prospecting well, and there is some talk of furnaces being erected.

NEVADA.

ENCOURAGING.—Nevada City *Transcript*, July 10: The mining prospect is looking very encouraging in this vicinity just now. Prospectors have great confidence in their ability to strike gravel in the ancient river channel, and the various quartz mines are looking unusually well. It is believed that we are surrounded by gold-bearing channels and leads on all sides, and that instead of the mines being exhausted, they will be better than now, even a hundred years hence. Such confidence argues well for the prosperity of the place, and we believe it is well founded. There will be more men wanting to invest capital in the county ere long. Everything looks encouraging now.

NEW YORK HILL.—*Foothill Tidings*, July 10: Everything about this mine moves along with the regularity of clock work, and quartz is fast accumulating on the dump, from which it is now being delivered to the mill. Among the noticeable improvements now being made at the mine is an arrangement of the chute from the ore dump so as to do away with the labor and trouble of shoveling; the quartz wagon is driven under a spout and by merely raising a gate the load is taken on in a few moments. The mine still continues to send out rich quartz from all parts, and all the levels are worked to the best advantage.

FEYER, the man whose new process for working ore is to revolutionize mining, should it prove as successful on a large scale as it has on a less, is tearing away the small works out near the race-track, and expects to have permanent ores of a capacity to reduce ten tons of quartz a day in operation within two or three months.

LARRIMER MILL.—The new steam works and additional batteries at this mill are about to run and when started will give more than double its present milling capacity. As the water is very low in Wolf creek at the present time it is with difficulty that they run all the stamps. They seem to have all the work they can do; the dumps at the mill are all full and a large amount of ore is accumulating at the New York Hill mine, and now being hauled to the mill.

OMAHA MINE.—Grass Valley *Union*, July 9: The Omaha mine's steam hoisting machinery has been put to work and everything works well. To-day hoisting by steam will begin; and when there is plenty of water in Wolf creek water power will be used.

PATENT SECURED.—After a long contest and much trouble, the Badger Hill gold mining company have at last secured a patent to their mining ground.

KENTUCKY.—An assessment of 20c per share will be found advertised in another column, and this week a contract has been let to sink the shaft 50 ft deeper, which will make the total depth on the ledge over 300 ft. The ground continues very favorable for sinking and the managers feel quite encouraged with the prospects met with as the work progresses. The walls are regular and the vein, though split up, shows excellent quartz in the stringers, and on the whole the outlook for the future of the mine is very bright.

PLUMAS.

GOPHER HILL.—Plumas *National*, July 10: We were shown some specimens on Monday, by Mr. N. Cadwallader, Supt. of the Plumas Ditch Co's mines, picked up on the bed-rock on Gopher hill. These were six pieces in all, ranging from half an ounce to three ounces,—regular old-fashioned lead nuggets—and worth in the aggregate about $150. Mr. C. informed us that the water season is about over with them, and that they will make their clean-up on Gopher hill during the next two weeks. This company keep the result of their work secret, but from the indications spoken of above, and other "symptoms," we conclude that Gopher hill will turn out a good big showing for the short run of water, and that the owners are well satisfied with their purchase of that mine.

ITEMS.—Another rich spot was struck recently in the Light ledge, and the workmen picked out over $400 in a short time. We saw a splendid specimen from the strike a day or two ago. A prospecting company are taking out ore from the old Kits' mine, and will send twenty tons to S. F. to be worked, as an experiment.

SAN DIEGO.

HELVETIA MINE.—San Diego *Union*, July 8: The Helvetia mining company, at Julian, received per steamer *Ancon* yesterday their new Cornish pump, which will be sent up immediately. The woodwork and everything is ready to set the pump in, and it will be put in operation without delay. It is a six-inch pump, with six-feet stroke, and has 350 feet of pipe.

SONOMA.

LOCAL ITEMS.—Russian River *Flag*, July 8: The Live Oak, near Cloverdale, has been bonded to John Batchley for 6 months. Six men are at work. The New Almaden is running the furnaces on old ore that is being picked over. Work is suspended in the tunnels. The Sulphur Banks mine turns out about 500 flasks a month.

TUOLUMNE.

ALPHA.—Tuolumne *Independent*, July 10: Superintendent Collins, at the Alpha T. M. gravel mine, is just coming into gravel. They have 2 ft of gravel in the top of tunnel and ledge pitching. The shore gravel is the same as that of the Humbug company.

ACTIVE operations are going on in the Evans mine. The new hoisting works and pump work splendidly, and water will be raised out of the shaft in about 6 days, after which they propose sinking 100 ft.

SUMMIT PASS.—There is considerable stir in this neighborhood about quartz. Cummins & Clark have a lead which shows free gold in every piece, with rich sulphurets. They have contracted to put up a steam 5-stamp mill; already a portion of the machinery, including the boiler, is on the ground and will be completed in about a month.

VENTURA.

ASBESTOS.—Ventura *Signal*, July 10: Specimens of extensive asbestos deposits, pronounced to be of superior quality, have been found on the south side of the San Emidio mountains, in this county, by Mr. Gibson. He also discovered galena, silver and gold.

Nevada.

WASHOE DISTRICT.

CONSOLIDATED VIRGINIA.—Gold Hill *News*, July 8: Daily yield, 550 to 600 tons of ore. The ore breasts on the 1500, 1400 and 1300-ft levels continue their regular yield of rich ore, with no material change in either the general appearance or yield. But little prospecting is being done in the mine, so that but few developments need be expected for several months to come.

CALIFORNIA.—Sinking the C. & C. shaft is making rapid progress, the work being pressed steadily ahead with the usual vigor. Crosscuts Nos. 4, 5 and 6 are still pressed energetically ahead, the face of all still in fine ore. The lateral drift running northward in the ore vein to connect cross-cuts Nos. 4 and 5 is also in rich ore. On the 1400-ft level the drift from cross-cut No. 3 is being extended toward the north line with the intention of continuing the cross-cut and blocking up of that portion of the ledge.

AMAZON.—The donkey engine for hoisting is being placed in position ready for future operations. It is confidently expected that everything will be in readiness to steam up by the 10th inst. A drift north has been extended into the ore body in the Glasgow ground, a distance of 15 ft, the ore continuing the entire distance of a fine character. A drift has also been run to the southward into the Amazon ground 18 ft, all the way in good ore At that point a winze has been started downward on the ore body.

CHOLLAR-POTOSI.—Daily yield, 60 tons of ore, the assay value of which is $31 per ton. This ore is extracted entirely from the old upper workings, which afford no new features whatever. The main incline has reached the 1300-ft level, at which point a new station is being opened with the intention of opening up and prospecting a new level.

NIAGARA.—The new hoisting machinery is in full operation, everything working with the utmost satisfaction. A fine substantial building, 30x60 feet in size, with a blacksmith and machine shop 20x30 feet adjoining, is being erected over the shaft.

NEVADA.—The west wall of the vein is reached, and the full width of the vein demonstrated to be 120 feet. It is a fine body of quartz, showing some streaks of very good ore. The west wall is very regular, smooth, and well defined.

SUTRO.—The main west tunnel is still advancing toward the ledge, the face in much softer rock than has been encountered for some time past.

OPHIR.—Daily yield of ore 300 tons. The ore stopes on the 1465-ft level, are looking and yielding well. The east drift on the 1500-ft level has been connected with the ore vein ready to commence the stoping of ore. On the 1600-ft level the stoping of ore has already been commenced, and the breasts are opening up splendidly, promising an excellent yield of fine ore. A drift north has been run from the bottom of the northeast winze a distance of 120 ft, the entire length in good ore, and the last portion showing a decided improvement in the character of the ore and vein.

BELCHER.—Daily yield, 450 to 500 tons of ore, keeping the mills all steadily running. The ore brests on the different ore-producing levels all show well and keep up their usual yield, while the character of the ore is gradually on the increase, the yield for the past month being considerably greater than for some time past. On the 1500-ft level cross drifts are being run and preparations are being made to soon commence the extraction of ore.

CALEDONIA.—Sinking the new shaft is making splendid progress, the workmen putting in a new set of timbers and adding 5 ft to the depth every day. The flow of water is still strong, but is easily handled by pumps.

IMPERIAL-EMPIRE.—The connection was completed between the up raise from the 2000-ft level and the winze from the level above last Friday morning. This air connection has been of vast benefit to the mine, and is rapidly cooling the drifts and preparing the way for a more expeditious cross-cutting and prospecting of the lower levels.

GOULD & CURRY.—The week has been mostly spent in enlarging the north drift on the 1700-ft level, relieving the timbers in a portion of the shaft, and getting a good ready generally for cross-cutting and prospecting operations.

BEST & BELCHER.—The connection of the south drift on the 1700-ft level is gradually cooling the mine and putting it in condition for future energetic cross-cuttings and prospecting operations.

BALTIMORE AND AMERICAN FLAT.—Sinking the main incline below the 900-ft station has been fairly commenced, and is making good progress. Sinking the winze below the 450-ft level is making fair progress, still following the rich seams of ore found on the level above.

LEO.—The winze is down 153 ft below the main tunnel level to-day. The vein is large and well defined, and the hanging wall continues smooth and unbroken; no foot wall in sight. The ledge matter has improved considerably since last report both in character and quality; the ore veins have become stronger and more concentrated, and will undoubtedly soon make into one solid body of ore.

UTAH.—The new pumping machinery is working with the utmost perfection, and the water is drained from the bottom of the shaft ready to resume the sinking.

SOUTH COMSTOCK.—To-day the shaft has attained the depth of 282 ft, with quartz, clay and other ledge matter at the bottom. Streaks of this quartz give very good assays.

ORIGINAL GOLD HILL.—Quite an improvement has been met with during the week in the ore of the south cross-cut from the main south drift, it assaying higher than heretofore, and evidently developing into a body of ore of more than average richness.

CROWN POINT.—There is little or no change in the production of the mine. Daily yield, 500 tons of ore. No change in any of the ore-producing sections worthy of note.

COSMOPOLITAN.—During the week the main drift north has been extended 15 ft, following the vein and extracting ore, assays of which run as high as $60 to the ton, four-fifths of which is gold.

JACOB LITTLE CONSOLIDATED.—During the week the main drift west has been in a considerably improved character of ore, giving high assays, and a valuable ore body is evidently being developed.

EUREKA DISTRICT.

BULLION.—Eureka *Sentinel*, July 11: During the week ending last night, eight furnaces have been in operation at the various smelting works, one less than the usual number, owing to the shutting down of one at the Eureka Consolidated works for the purpose of repairing. It will be at work again this week. During the time the following amounts of bullion have been shipped:

Furnaces.	Product.	Shipment.
Eureka Consolidated	302,910	414,335
Richmond	270,000	.....
Atlas	115,640	120,225
E. K. Con	80,000	70,000
Total Pounds	768,550	604,610

The Richmond refinery shipped, during the time, 92,000 pounds of refined lead, and 11 bars of bullion valued at $25,695.07.

CENTRAL DISTRICT.

GOOD RETURNS.—*Silver State*, July 10: Charles Clark, of Central district, had a lot of ore sampled at the Humboldt reduction works on Saturday. Two lots from the Emerald mine yielded as follows: First class, $406.80; second class, $133.49 per ton, and some from the Silver Monarch which went $952.38. Mr. Clark realizes a handsome sum from this ore, and returns to Central well heeled for a prospector. The Emerald is from twelve to eighteen inches wide, and the Silver Monarch about three feet.

ELY DISTRICT.

OUR MINES.—Pioche *Record*, July 11: An unusual degree of activity is manifested in the matter of new mining claims, a large number of deeds having been made during the week. A large amount of hoisting machinery of the latest and most approved pattern will shortly be placed in operation by the Meadow Valley company. The plans and specifications are now being prepared by George Adams, and as soon as completed will be at once put in practical construction.

NEWARK.—Work is steadily going ahead on the west ground, 700-ft level. The ore seam still continues about the same width; rock still hard and progress consequently slow.

PIOCHE.—Works closed down in order to put in place heavier machinery. Guides in ready to receive cage. This company has now ample power to reach a total depth of 1400 ft. We no-

ticed 1700 ft of improved flat steel wire cable on reel. The engine frame having been originally intended for a larger cylinder, there will be a few days required to adjust the present one.

Silver Peak.—Grading drifts, laying track and repairing stations completed. Mine now being in perfect working order, a larger force will be employed and the ledge more thoroughly and generally prospected. The lowest, 600-ft. level gives every prospect of a speedy acquisition of paying ore in paying quantities.

Chief of the Hill.—The usual amount of work was continued during the past week and ore of as fair grade as heretofore extracted. The accumulated pile of ore has been all shipped to the Newark mill and worked up, but no return as yet indicating the result.

Alps.—This mine is being worked with the usual degree of success, ore being daily raised and shipped to the Newark mill for reduction. The mill has not worked any of this ore during the past week, but will commence on it as soon as a sufficient supply is on hand. All that has been worked has averaged about $200 per ton.

Huhn & Hunt.—A reduced force of men are at work in this mine, engaged almost entirely in extracting ore. A considerable amount is daily raised and hauled to Bullionville. The general appearance of the ledge is good, and the ore of a higher grade than heretofore.

Meadow Valley.—Work is still continued on the east drift from No. 3, on the 1200-ft level; also, on the drift running west from the summit shaft on the same level 130 feet apart to connect both drifts. The usual amount of high grade ore is being hoisted daily from No. 3 shaft. The water problem will be solved shortly, as Captain Tyrrell is making preparations for the erection of machinery sufficient to overcome this difficulty.

Pioche West Ex.—The usual force of men are employed running west. The ledge continues about the same width, etc. Ore of low grade. The air connections not yet made on the eastern ground, when done, stoping of ore will be resumed.

Raymond and Ely.—The usual industrial state of affairs exist in and around the mine and various departments connected with it. Drifting is still continued on the western ground, but little change being observable in this portion of the work. Work is steadily continued on the 8th and 9th levels. The regular quota of ore is daily raised—no diminution as to quantity or quality existing. Sinking in the main shaft is continued, though necessarily slow. The pump is doing all that could be desired, and though not running to the limit of its capacity, keeps the water under subjection.

American Flag.—The main shaft is now 96 feet below the tenth station. They have lately encountered harder rock than they have had to contend with for some time, nevertheless, they are making satisfactory headway. The third level stopes continue to yield ore daily, adding to that already on the dump, which now begins to assume a pile of quite respectable proportions.

WHITE PINE DISTRICT.

Leased.—White Pine *News*, July 10: Henry Stede, of this place, has leased to Hermann Minder, for nine months, the Big Bonanza mine, on the west side of Treasure hill. It is said to be a fine mine, and preparation has been made for taking out a large amount of ore. Now that we are to have two furnaces in operation in a short time, a large amount of smelting ore will be needed, and we are glad to see work commenced on the mines.

Hamilton Smelting Company.—The stockholders of the above mentioned company held a meeting on the 2d inst. and adopted a code of by-laws. On the 6th inst. another meeting was held and the by-laws were amended, by adding two more trustees to the five that had previously been elected. The newly elected trustees are Marco Medin and Caspar Schmidt. A considerable amount of stock was subscribed at this meeting. The first instalment of twenty-five per cent. on the amount of stock subscribed, which was made payable on or before the 10th inst., has all been paid up. The following officers were elected for the first six months: President, Samuel Liddle; Treasurer, J. F. Lookwood; Secretary, Wm. Timson; Superintendent, W. H. Ford. Active operations have been commenced by the officers of the company, and they are now prepared to make contracts for ores, charcoal and wood.

CORNUCOPIA DISTRICT.

The Camp.—*Silver State*, July 10: A practical miner, who recently left this place for Cornucopia, writes as follows concerning that camp: "I find things much better here than I expected; everybody seems to be busy, and there are eight new buildings going up. The Leopard company gives employment to 50 men and will shortly double this number, as teams have been started to bring in another mill. The foreman of the Leopard informs me that at a depth of 150 ft they had drifted 14 ft across the vein, and had not yet got through it. The ore is of as fine a quality as I ever saw. There are but few idle men here, and I feel contented and have made up my mind to stay with this place."

Arizona.

Rich Discovery.—Arizona *Miner*, July 2: Some years ago, while Ed. Peck was acting as guide for the military, he discovered a monster quartz ledge about 2½ miles east of the head waters of War Eagle creek, in the direction of Bradshaw mountain, but finding but little gold in the rock, and being unacquainted with the characteristics of silver-bearing ores, he paid but little attention to it until recently, when he became convinced that the ore resembled that of some of the recent discoveries in silver, and determined to investigate it more thoroughly. He accordingly took with him C. C. Bean, Wm. Cole and T. M. Alexander and revisited it last week and ascertained the vein to be from 50 to 125 feet in width, and by assay from some 50 samples taken from various parts of the lode to contain an actual working value of from $40 to $50 in silver, besides a fair percentage in gold. Satisfied that they had a good thing in the mine, they began to prospect for water, timber, etc., and, becoming thirsty, Peck went to a spring or brook to drink, and after satisfying his thirst sat down to rest and refresh himself, when his eye rested on a large piece of rich silver float near the bed of the stream; this he examined and becoming satisfied of its extraordinary richness, directed his vision up the stream with a view of ascertaining the source from whence it came, and to his astonishment, there in plain view, cropping out in bold relief on the side of the mountain stood the ledge, not so wide as the Wallace, but richer by thousands of dollars to the ton. They had not time to ascertain the exact width of this new find, but we are assured by Mr. Cole that it is no mean rival of either the Tiger or the McCrackin in size, and will discount either in richness. They brought in 100 pounds or more of the ore, which assays away up into the thousands. In fact, it is not necessary to assay it at all. Even the unpracticed eye of the novice in silver mining must be dull indeed not to recognize in this ore the genuine horn silver permeating the whole mass, besides chlorides all over and through it in every direction. Some of the specimens that have been exposed to the atmosphere for ages are oxydized to such a degree that the silver is nearly all in that state, leaving the residue of rock full of cells like honeycomb, thus giving a very good idea of the proportion of metal to that of rock according to bulk.

Idaho.

SOUTH MOUNTAIN DISTRICT.

Cor. Owyhee *Avalanche*, July 9: Having been here but a few hours, and these made up of drizzly weather, I am incompetent to the formation of a correct opinion as to the prospects of business, condition of the camp and other topics requiring extended time for investigation. While matters are not seemingly as lively here as they were a month ago, there is a hopeful feeling that the summer will not pass away without witnessing the inauguration of an additional movement on the part of capitalists from abroad looking to the more extended development of the South Mountain mines. The mines that are now being worked are turning out well, and are steadily improving in developments, furnishing a groundwork for future operations, not at all calculated to disparage. Some of the bullion recently turned out at the furnace here has assayed as high as $670.

As the mines are worked downward the percentage of lead decreases and the gold and silver development improves. Many of the ledges are opening up splendidly in rich rock, and perhaps the only discouraging feature is the appearance in some quarters of considerable quantities of zinc, or, as it is termed by the miners "black jack," which is a disturbing element in connection with smelting operations.

Mr. Hastings, a gentleman quite familiar with mining matters here, informs me that the prospects are quite flattering. He has a force of men at work at the Golden Monarch, where the shaft is in over 200 ft, and nearing a ledge 60 ft in width, which is known to be rich in splendid carbonate ore and galena from one side to the other.

Montana.

Mining Items.—Helena *Independent*, July 1: Our reporter interviewed a gentleman yesterday who had just arrived from the southern portion of Deer Lodge county, and from him gathered the following facts:

There are a dozen men working in and about Highland gulch this season. They are working over old ground, with rather favorable results.

The Moose Creek mines, a couple of miles west of Highland, are paying very well. Some colored men who are working on a bar on Moose creek, or rather a tributary of that stream near its confluence, are said to be making from $12 to $15 per day to the hand.

The old diggings in the marsh, worked for many years by Pony Falconer, are paying better than ever, and all the claims in that vicinity are paying fair wages.

Messrs. Tranor & Co., are putting in a bed-rock flume near the saw mill, and have most excellent prospects, with a good bed of gravel, but the small supply of water afforded by Moose creek, together with the fact that the bed of the stream has but little fall, renders mining slow and somewhat expensive. It is believed that the Moose Creek mines will furnish steady employment to quite a number of men for several years. The mines are not what is termed rich, but pay good wages.

The arastras belonging to J. E Dickey and Lepine, Marceau & Co., have been idle all the season, the owners thinking they could make more money out of their placer mines.

One of the owners of the Canadian lode, which has been worked with profit for a number of years, until within the past few months, says that work will be prosecuted upon it the coming fall and winter.

The Dixie lode is now the sole property of Mr. J. E. Dickey. He became discouraged a few days ago and shut down work upon it, but it is reported that he will shortly resume operations upon a scale more extensive than before.

There has been no work done this spring on the Day & Harvey lode, but it is valuable property, and will be worked as soon as the placer mining season closes.

The last mentioned mine is silver bearing rock, and very rich. The two former carry free gold, but the ore is of low grade, though very abundant and easily reduced.

Oregon.

Cinnabar.—Oregon *Sentinel*, July 10: Mr. M. Caton yesterday showed us a small phial containing about a pound of quicksilver, which he informed us had been taken from 15 pounds of cinnabar from the Hodges claim in the Meadows' district. The ledge is now at the depth of 23 ft, 3 inches wide; if it shall increase in width in the same proportion as it has so far, and continue as rich as the above, we have no doubt but that it will prove a source of profit to its owners.

Utah.

Boulder Springs.—Correspondence Salt Lake *Tribune*, July 8: Having heard glowing accounts from the new mining district at Boulder Springs, situated about 25 miles from this settlement, I concluded to pay a visit to the new discoveries, and by personal observation satisfy myself as to the correctness of the statements made in regard to them. I have just returned from a week's trip, during which period I visited nearly every mine and prospect in the district, and I will, with your permission, lay before your readers the result of my observations. Boulder Springs is one of the principal localities from whence is derived the supply of charcoal used by the smelting furnaces at Stockton, Sandy and other places. The vicinity is thickly timbered with pinyon pine, cedar, maple and mountain mahogany, and on this account, in connection with the abundant supply of grass for their cattle, the coal burners have made it their headquarters. Early in the spring of the present year, Mr. Charles Neilson, while engaged in cutting timber on what is now called Mountain Chief hill, picked up a piece of rock which upon examination proved to be rich with galena. Mr. Neilson located this ledge under the title of Rambling Boy in the names of himself and associates, and work was at once commenced upon it and continued until the party ran out of provisions. The shaft is now about 6 ft deep and shows as pretty a prospect as was ever struck in the Territory. The ore is galena and carbonate, and at present assays from 15 to 20 ounces of silver and 60 to 75 per cent. lead. Since the location of the Rambling Boy, the discoverer, Mr. Neilson, has located another claim, known as the Boulder Springs, where, with about 2 days' work, with pick and shovel only (no powder having been used), a breast of rich galena, about 5 ft in width, has been exposed, which is precisely of the same character as that in the Rambling Boy, and the mine is undoubtedly on the same ledge, which can be traced for about a quarter of a mile.

Mining Patents.

During the past month patents have been issued for the following mining claims in California: Amador county—E. H. McClure and others, Hercules quartz mine. Nevada county—George C. Turner, Homestake quartz mine. Placer county—Michael McBride, Secret Canon quartz mine; Charles Brown, placer mine; S. N. Hosmer and G. C. Lewis, quartz and placer mine.

Colorado—Park county, Assgrea Hall and George W. Bunk, tunnel lodes Nos. 1 and 2; James A. Thatcher, Compromise mine; J. Thatcher, Alps, Hoosier, Juniata and Silver Star lodes; George E. Pease, placer mine; Edward H. Henderson and S. B. Morgan, Pulaski lode; J. W. Hall, Comet and Adriatic lodes; John Q. Hart, Phillips lode; Boulder county, David Evans, Evans' lode; C. L. Seaton, Seaton Extension lode; E. W. Rogers, Junction lode. Montgomery and Madison counties, P. P. James and others, placer mine.

Nevada—Story and Lyon counties, Green gold and silver manufacturing company; Green lode, Esmeralda county, Jacob Groth; East Garibaldi lode, Albert Mack; Sonora lode, Wm. H. Hall; Lady Jane lode, Roop county, L. Goodwin and J. B. Winters; Ida Nos. 1 and 2 claims.

Oregon—Baker county, James Tallman and others, placer; Wm. L. Sutton and others, placer; James Lynn and Thos. C. Looner, placer; Robt. Ketchen, placer. Union county, Wm. H. Thompson, placer. Grant county, J. P. Cleaver and others, Kraft & Co.'s placer.

Utah—Salt Lake county, James W. Cummings and others, Beemis & Hyatt lode; Tooele county, Marcus Daly, Red Pine mine; A. Wall and others, Mahogany No. 2 mine.

During the first six months of 1875 the recorded sales in the San Francisco Stock and Exchange Board, the Pacific Stock Exchange Board and the California Board aggregated $175,000,000. The sales in the San Francisco during this period aggregated $124,985,255. During a corresponding period in 1874 the sales in the San Francisco aggregated $105,583,560.

General News Items.

A desperate attempt was made to rob an Adams express messenger at Long Point, Illinois, on the Vandalia railway, on Thursday night of last week. The engine and car was cut loose and the engineer killed. The messenger barricaded the doors and kept the robbers at bay until help arrived.

Advices from Klamath county report the Hoopa tribe of Indians in revolt. They have already murdered a carpenter employed at the Florence mine and demand that the miners shall leave. Gen. Schofield has ordered a detachment of soldiers to the scene.

The Centennial Exhibition will continue six months, commencing April 19, 1876, and closing October 19. It is thought the average daily attendance will be 50,000. At this rate the aggregate attendance during the six months will be about 8,000,000.

The Atlantic cotton mills, at Lawrence, Mass., which gave employment to 1,250 operators, shut down last week for eight weeks' suspension, and may be a longer time, if the present stock of manufactured goods is not marketed.

An attempt was made the night of the 4th inst., to blow up the store of Willard & Falk, in Plymouth, Amador county, with giant powder, but the villain who made the attempt failed, by not using quite enough powder.

Specials from Paris report that the country between Villefranche and Macon has been laid waste by floods to the extent of forty kilometres. The wheat and vine crops in many places have been utterly destroyed.

Malietoa has been chosen as king of the Navigator islands, and Col. Steinberger who visited the islands as special commissioner of the United States, has been appointed Premier.

The Cunard steamer *Scythia*, which sailed from Liverpool on the 10th inst. for New York, came in contact with a whale off Roche's point, and lost a blade of her propellor.

During the recent storm in the harbor of Valparaiso, Chile, 40 boys belonging to the training ship, between 20 and 30 sailors, and from 12 to 15 boatmen were drowned.

An official telegram in the Paris *Moniteur* corrects exaggerations as to the number of people drowned in Toulouse, and states that so far only 216 bodies have been found.

The Vallejo *Independent* has changed hands. It will be independent in politics no longer, but will henceforth advocate Democratic principles.

Orangemen celebrated the anniversary of the battle of the Boyne, the 12th inst., in various sections of the Union and the Canadas.

By the recent earthquake in Colombia, 5,000 lives were lost in Cucuta alone, and a number of small cities in the vicinity are in ruins.

Mr. Hawley, local editor of the Los Angeles *Star*, who was stabbed by a young hoodlum in that city on the 6th inst., is recovering.

The English radicals protest against allowing the Prince of Wales cash to pay the expense of his proposed trip to India.

A new steamer line to Vancouver island will be inaugurated by the P. M. S. S. Co., on the 1st of August next.

The Western Union Co. intend replacing the telegraph cable which connects Martinez with Benicia by a new one.

It is reported that a whale one hundred feet in length, was killed between Monterey and Santa Cruz recently.

The mutineers of the schooner *Jefferson Borden* have arrived in Boston and will be tried immediately.

The jury have found young Granice guilty of murder in the first degree—penalty, imprisonment for life.

A fire destroyed the hotel at White Sulphur Springs, Napa county, on the morning of the 7th inst.

A grand farewell meeting to Moody and Sankey took place in London last Monday evening.

The forces of Alfonso have lately been gaining some very decided advantages over the Carlists.

President Grant is a grandfather. Mrs. Sartoris gave birth to a fine boy on Sunday last.

The Cotton States Congress assembled in Raleigh, (N. C.,) on Tuesday last.

The American team will shoot no more matches on the other side of the water.

The weavers of Brunn, Anstria, are on a strike.

The Santa Monica land sale began on the 15th inst.

Henry Ward Beecher has had his salary increased to $100,000 per annum.

An insurrection against the Turkish tax-gatherers has occurred in Dalmatia.

Several failures are reported of business houses in New Haven, Conn.

The American rifle team are visiting points of interest in Scotland.

Crop prospects are reported excellent in Arkansas.

Better hotel accommodations are needed at Santa Cruz.

Gen. Frank Blair died on Friday, the 9th inst.

Senator Logan, of Illinois, is in this State.

Idaho Mines.

A correspondent of the *Alta*, writing from Silver City, Idaho, gives the following account of the mines and mills in that vicinity:

The principal mines are located upon two belts of miners, which are nearly parallel and about 2,000 feet apart. One is known as the Oro Fino belt, the other as the Poorman belt. The former has been opened at different places for a horizontal distance of about 4,000 feet, and the latter for a distance of about 3,500 feet. Between these belts, so called, are several parallel veins, on which are located the War Eagle, Illinois, Central, Empire, Panper and other mines of note.

Commencing at the north end of the Oro Fino belt, the first mine met with is the Oro Fino mine. This mine is prominent as being the first location made, and is the discovery claim of the camp. It embraces 700 feet in length along the vein, and is worked to a depth of 350 feet, on an ore vein from two and a half to four feet in thickness.

The next mine south on this belt is the Ida Ellmore, which contains also 700 feet in length. This mine has a main shaft 1,250 feet deep, which is supplied with fine hoisting works, with a fifty horse-power engine. The ore has been stoped out down to the 550-foot level. Below this point, to the bottom of the shaft, the vein has been opened up by drift and put in condition for yielding ore in larger quantities—the vein having widened gradually, until it is five to eight feet wide in the bottom.

The next mine south is the Golden Chariot. This mine is 760 feet in length, and is opened by two shafts, the most northerly one, or "Golden Chariot shaft," being 1,050 feet deep, and the other, or "Minnesota shaft," 900 feet deep. At this part of the ledge the vein is from two to four feet wide. At the 8th, 9th and 10th levels they have a good body of ore exposed, which, with the hoisting facilities of two shafts, will soon yield largely.

The next mine south is the South Chariot, which is 600 feet in length. This mine is opened by a shaft 1,000 feet deep, sunk near the southern boundary of the claim. They have good ore in the 7th, 8th, 9th and 10th levels. The mine is well opened, and is in shape to continue to produce its thirty to fifty tons per day. The vein is from three to four feet in width.

The next mine on this belt is the Mahogany, which covers 900 feet on the vein. It is opened by a shaft about 1,000 feet deep, sunk near the north boundary of the claim. The ore has been stoped out down to the 7th level. The 8th, 9th and 10th levels have been opened up from the shaft for a distance of 500 feet in good ore, and winzes have been sunk from the 9th to the 10th levels, which show good ore the entire distance, and giving to the mine excellent ventilation. The reserves of ore exposed in this mine contain some 15,000 tons that will work from $40 to $70 per ton. The vein is strong and full four feet wide in the bottom.

In all the mines on the Oro Fino belt the vein becomes stronger as depth is attained, while the quality of the ore seems to improve. We have here, as your readers will observe, a single vein of ore, opened up for a distance of three-fourths of a mile, and of a character that ensures its permanence and continued richness in depth. It seems to be a true fissure vein, the bottom of which can never be reached.

Leaving the Oro Fino belt, and passing westerly toward the Poorman belt, the first mine encountered is the War Eagle, which is located upon one of the several parallel veins lying between the two prominent belts, of which we made mention above. The War Eagle comprises 1,000 feet in length on this vein and is opened by a shaft 700 feet deep. The ground is worked out down to the fourth level, and a portion has been removed also from the sixth level. On the seventh level the vein is opened by a drift to the north 430 feet in length and one to the south 200 feet long; the eighth level being opened by drifts to a somewhat less extent. The reserves of ore exposed contain about 6,000 tons that will work about $30 per ton. The vein is from two to four feet in width and shows strength and permanency in the bottom.

Passing on northwesterly we come to the Illinois Central, located upon another vein. This mine embraces 1,000 feet of the vein and is opened by a shaft 400 feet deep. The ground is stoped out down to the 100-foot level. Below this point the ore body is shown by drifts to be 250 feet in length and consists of ore that will mill from $50 to $60 per ton. The vein is from two and a half to four feet in width and is strong and of the best quality in the bottom. Passing thence southwesterly we come to the Empire mine, located upon still another vein, and occupying 600 feet of its length. The vein is here opened by a shaft 600 feet in depth, at a depth of about 400 feet. A drift run west 60 feet cuts a blind ledge from two and a half to three and a half feet wide, the ore of which is good milling ore, and, unlike most ore in this district, is chiefly valuable for its gold. The main vein of the mine is from two to four feet wide and is very rich in placos, but is not uniformly as favorable ground to work as the west or blind vein. Going thence westerly we reach the Poorman vein or "belt" as it is here called. This vein has been opened in many places for a distance of from one-half to three-fourths of a mile. Beginning at the north end, as in the case of the Oro Fino belt, the first mine is the Poorman, a rather full account of the early history of which I gave in my letter of June 1st. This mine is at present the centre of attention here, as they have made some new developments which cause great importance to be attached to the results of the next few weeks' work. When the management once grasped the idea that the dyke which divides the vein did not cut off the ore to the south, as was first supposed, they made preparations to open up the mine on a vast scale. A shaft has been sunk in the east wall a distance of about 700 feet, and while work has been progressing on the shaft a drift has been run on the vein from the outside, a distance of 350 feet to a point opposite the shaft, where it is 380 feet below the surface. The last 300 feet of this drift is in very fine ore the whole width of the drift and of unknown extent above and below its level. The shaft extends some 300 feet still below the level of this drift, but as it is in the wall rock, it has not been explored. The vein cross-cuts are now being run from the shaft to the vein at four different points, one opposite the drift and three below it. These cross-cuts will very soon solve the problem as to the extent and value of the bonanza which the drift has exposed. Hence, the excitement here among those who are familiar with the great richness of this mine in former days, and who think that the time is not far distant when a still greater excitement will occur than that which took place in '65 and '66. There are 1,000 tons of ore on the dump that have been taken out of this drift. A few days' more work will connect the shaft and drift, when ventilation will be secured, and the mine be in a shape to produce 50 to 75 tons per day of ore that will average at least $100 per ton. The ore from this mine is now being hauled to the Leonard mill, which is nearly finished, and which will have a capacity of 15 tons per day. I am informed that they have arrangements made to lease another mill of a capacity of 30 tons per day.

The first mine south of the Poorman is the South Poorman, comprising 1,600 feet in length. They have commenced development by sinking two shafts on the vein; they are about fifty feet deep each. The most northerly of these shafts is near the south boundary of the Poorman, and has already struck the rich ore which is exposed by the drift in the Poorman, showing that the bonanza, that is opened for 300 feet in this drift, extends at least 500 feet southwesterly at a somewhat lower level, making the present known length of the bonanza 800 feet. The ground in the South Poorman is favorably situated for working the mine.

Next south of the last mine named is the Silver Cord mine. This mine comprises 800 feet of the vein, and is opened by a shaft 380 feet deep, from which three levels have been opened up for distances of 90 feet, 335 feet and 585 feet respectively. Above the third level there is about 800 tons of ore exposed that will mill about $50 per ton. Below the third level a winze has been sunk 110 feet in good ore, that will mill $75 per ton, the vein averaging two and a half feet in width.

Mills.

There are five mills in the camp containing sixty-five stamps and ample pan capacity; also three arrastras with amalgamating pans, presenting altogether ample facilities for treating 150 tons per day. These mills are all running night and day on the ore from the different mines, and are shipping a large quantity of bullion.

This camp offers superior advantages to many mining districts for working the mines and treating the ores, notwithstanding its distance from the base of mining machinery supplies, as it has a lasting abundance of that great boon of the miner—good and cheap timber for the mines and inexhaustible quantities of the best of steam fuel.

Have We Diamond Mines?

As a matter of local interest, the Idaho *Avalanche* gives the following extracts from a letter of recent date written by Wm. W. Habersham, formerly of Silver City, Idaho, and published in the New York *South:*

"In 1864-5 I resided in the Territory of Idaho, being engaged in quartz mining. In 1868 I discovered and located a quartz ledge, which was supposed to be an extension to the celebrated 'Poorman gold and silver quartz ledge,' and secured by purchase and otherwise eighteen hundred feet of ground. In sinking a shaft on this ledge, I discovered near the surface of the mountain, imbedded in ferruginous sand, overlapped and underlayed by dark blue clay or mud, nodules of various sizes, ranging from that of a small pea to the size and shape of a pigeon's egg, which when broken open were found to contain a remarkably hard and brilliant substance, more brilliant and harder than crystallized quartz. These nodules were incrusted by clay of the color of crude gutta percha, (light drab) and could only be broken by using an 8½ lb. sledge hammer, driven with great force.

"I have been informed by a Norwegian miner that my description of the strata in which the nodules were found, answers exactly to that in which most of the finest diamonds are found in Brazil—with the one exception that in Brazil they are found in the same strata in the beds of rivers, whereas in Idaho I found them on the side of a hill, the top of which contained marine shells—and which must have been at some remote time the bottom of an inland sea."

Mr. Habersham is now a resident of Brunswick, Georgia, where his brother, Hon. John B. Habersham, resides. He says that he does not wish to create a diamond excitement, but only desires to call attention to the matter, in order, if possible, to ascertain the character of the nodules, which he believes to be diamonds.

The Second Arctic Expedition.

The "second Arctic expedition," which has been announced as "going out in search of the remains of Sir John Franklin," is in reality, says the London *Standard* of June 10th, a private cruise of Mr. Allen Young, who will shortly leave England in the exploring yacht *Pandora*. This vessel, which is fast preparing for sea, will probably sail on the 23d instant. She is 480 tons burden, and 80 horse-power, and was late a despatch gun vessel. She was examined by Sir Leopold McClintock for the Polar expedition, and, being considered too small, was rejected for that service, and was afterward purchased by Mr. Allen Young for an exploring scientific cruise to Davis' strait. The Pandora will probably visit the ports in Western Greenland; thence she will proceed to Melville bay, and pass Smith sound. Thence she will continue her cruise on to Lancaster sound, in order to examine any opening northward or westward, until the season becomes too advanced to remain out longer, as it is not Mr. Young's intention to winter away unless compelled to do so. In anticipation, however, of such a contingency, the ship will be provisioned for eighteen months, and supplied with traveling tents, sledges, and all other necessary equipment, and the officers and crew will also be prepared for a winter's sojourn. The *Pandora* has been thoroughly overhauled by Messrs. Day and Summers, of Northam, and fortified both internally and externally. She has been doubled with four-inch planks, and her bows have been cased with iron. She has also been divided into three water tight compartments, and beams have been inserted below. Her rudder post and stern have, as well, been strengthened with all possible care. On Wednesday last she made a very satisfactory trial trip. The speed she gained was 8½ knots per hour when going under "easy steam." The boilers, engines, propeller—indeed all her machinery—have been thoroughly put into working order. Mr. Allen Young will be in command of the ship, and Lieutenant Lillingston second in command. There will also be on board a staff of scientific officers.

Natural Gas for Fuel.—We find the following item in the *American Manufacturer*, but do not know whether to credit it as original or not, as several items from our own journal appear in the same issue without credit: It is well known by our readers that Messrs. Rogers & Burchfield have been using natural gas exclusively at their works at Leechburg in iron making and under their boilers, but is not so generally known what they are doing in that direction at their works at Apollo. Some time ago they bored for gas just below these latter works, and succeeded in getting a sufficient quantity, at a depth of 1,200 to 1,300 feet, but the contractor drilled a little deeper and struck salt water, which shut off the gas. They then commenced to drill another well, just above their works, which is now down about 700 feet, and will be sunk 1,300 feet if necessary. Meanwhile, they have adopted a plan of pumping the salt water out of the other well in such a way as to utilize both the gas and the water. We will try to describe the apparatus: Two pipes of different size have been put in the well, one inside the other. The small pipe is closed at the lower end, but has a number of half-inch holes in its circumference, near the bottom; a gas cap fits on the top of both pipes, the large pipe having vent through two holes in the circumference of the cap and the small one through a hole in the top; through which hole a sucker rod also works. When the sucker rod is operated the water flows out through this hole, that surrounding the pipe flowing into it through the half-inch holes near its lower end, filling the vacuum created by the pumps. Pumping has been commenced, and the theory is that when the water surrounding this pipe becomes exhausted, the gas will take its place and rush out of the holes in the side of the cap, at the top. Salt will be manufactured from the water that will be continually pumped through this pipe. Thus we will have the spectacle of a gas well and salt well in one.

Belting and Gearing.—As regards the transmission of power, the Americans, says a French writer, aim at achieving two things which are correlative—the lightest possible weight and the highest possible speed. Hence the universal substitution of belting for gearing, and the general adoption of light shafting and small pulleys, which are conspicuous features of their system of transmitting power. The first mover is usually a gear, but after that all transmission is obtained by belting. The belting is a little study in itself, but it will suffice to say here that belts of the latest improved pattern run for wonderful lengths of time without piecing. The ease and durability of the system would astonish the advocates of gearing. The light shafting and small pulleys in general use are said to save twenty-five per cent. of the power. The shafting is run twice as fast, and hence the pulleys can be smaller, yet the fly-wheel of a powerful engine may be large. The pulleys are cast, but it is expected that wrought pulleys much lighter will soon come into general use. Hollow shafting is finding much favor. The reduced price at which steel is now being produced will no doubt soon lead to the introduction of that metal for pulleys. The less amount of metal required for their construction would result in an important saving of power in a large establishment.

The Sumner Mine.

The big mill connected with this mine has now been running several weeks and no difficulty is experienced in supplying it with ore of a comparative high grade. Although there have been few misgivings, the successful inauguration of this great reviving enterprise is felt both as a relief and satisfaction. Every day now adds to the certainty of great mining industries springing up at Kernville and vicinity to stimulate, in no slight degree, the settlement and agricultural development of the great Tulare valley.

The Sumner mine is on the west side of the north fork of Kern river, a few miles below the point where it breaks forth from an almost inaccessible canon of the Sierra Nevada. Kernville lies between it and the river. The position of the land claimed by the Sumner mining company—in length about two miles—is in the immediate vicinity, running parallel with the river, and the croppings are three or four hundred feet above it.

So little, comparatively, has yet been done in the exploration of this mine, that it is impossible to say with certainty what is the width of the fissure, but it will probably average about one hundred feet. This is not entirely filled with gold bearing vein matter. On the east or foot wall there is a seam or selvage of clay such as is seen probably in no other mine on the Pacific coast except the Comstock. In places it is fourteen feet in thickness and sends off branches that find their way through the quartz above it. There is clay on the west wall also, but in no unusual quantity. The west wall is granite and the eastern slate, a formation that is believed to be eminently favorable.

The mine is being opened in four places. Near the north end of the company's claim are two shafts and adit levels with complete pumping and hoisting works, from which the mill is supplied. About half a mile or a little more to the south, at a favorable point for the purpose, a large tunnel is being run that will strike the lead at right angles in a distance of about six hundred feet. South of this nearly a mile a large and well timbered shaft has been put down to the depth of one hundred feet. It is on the eastern or foot wall, following which to the north a drift has been extended six hundred feet to an air shaft. In several places along this drift transverse cuts have been made to the west wall, and a body of quartz averaging forty feet in width disclosed of about the same value for milling purposes as the one that has hitherto been worked from the northern part of the mine.

The greatest depth that has yet been reached is at the main shaft where the principal hoisting and pumping works are, and whence the mill is chiefly supplied. But this is insignificant—not more than one hundred and seventy-five feet. This shaft descends under the incline of the west wall, and is quite as substantial and thorough a work, together with all its appliances, as any of a similar kind on the Comstock. From the bottom drifts are being extended north and south, and above ore is taken out in the usual manner. The best ore is found in the vicinity of the west wall, and this part of the lead, of a width varying from three to thirty feet, may be styled rich. It is on ore from this part of the vein that the mill is being run. The body of ore left standing on the east side is low grade, but not so low but that it may be profitably worked. It is held in reserve for some future occasion. There is an immense quantity of it. It may be taken out and milled at a trifling expense and is a kind of reserve fund of immense value.

It is difficult to understand the peculiarities of so large a vein as this. The galleries and other works with which it has been penetrated and intersected already form quite a labyrinthian and perplexing system to the stranger. The design apparently is to find and follow all the rich ore channels, leaving for the present the low grade ores as a support to the mine.

But the visitor is surprised at the quantity of good ore the mine, even in its present state of development, is capable of producing. It is worked on the most approved and perfect system. Every labor-saving appliance that ingenuity can devise is made use of. In especial the timber is substantial and thorough.

At the insignificant depth that has been reached on this mine, nothing can be positively said about it more than that the indications are of the most favorable kind. The shaft must go down at least four hundred feet further before its true character and value can be determined. That it will be extensive and productive may be considered certain, and that it may develop into the best gold mine in the world is not improbable.—*Visalia Delta.*

The Holleran Coal Mine.—We have mentioned several times the prospecting operations of E. Holleran, who for some time has been engaged in digging for coal on his ranch, eight miles northeast of this city. Mr. Holleran discovered a coal bed in a gulch which was laid bare by the floods of last winter, and in the spring commenced sinking a shaft a short distance therefrom, which is now down fifty-two feet. A ledge eleven feet in thickness, with fire clay walls above and below, and closely resembling the formation in the Monte Diablo mines has been penetrated. Several experts and experienced miners who have visited the shaft have expressed the belief that a valuable mine will be developed. A company has been formed for the purpose of carrying on further prospecting operations, and it is the intention to commence work next week and prosecute it vigorously.—*Petaluma Argus.*

Good Health.

Typhoid Fever—Its Cause and How to Avoid It.

It being conceded by every sensible person that good health is paramount to all other human blessings, we take frequent occasion to tranefer to our colnmns practical information tending to promote and preserve the blessing so essential to all. From the *Herald of Health*, for April, we condense the following:

The range of what are called preventable diseases ie now known to be very wide, and all such diaeaeea it ahonld be the first dnty of man to prevent. Much of thie is not only preventable disease, but ia diseaee that is called into existence only by the act or by the neglect of men; and it ie not too mooh too esy thet there hea never been a case of typhoid fever that waa not almost directly caneed by the ignorance or by the criminal neglect of some person whoee doty it should have been to prevont it. Snch disease never comea without cauee; and its cause ie never anything else than organic poiaoning, arieing from organic decaying matter or from the spread of the infection directly from a patient soffering from the disease.

Typhoid fever hae many names, all of which are enggeetive of ite origin. It is celled "drain fever," "sewer fever," "cesspoul fever," "foul well fever," "nightsoil fever," etc.; and it is never caused except hy the introdnction into the system of the germ of the diseese—which can originate only through the operation of neglected wastee, or by commnnication throngh the lunge ur stomach by meane of foul air or water, or from germs arieing from the excreta of typhoid patients. So far as ite contagion ie ooncerned, ample ventilation of the eick room and the immediate removal or disinfection of the fecea are ample preventivee. It is not contagiuos, as emallpox is, but is spread by the action of germe which infect the locality of the patient, and extend more or less widely according to the precantione used to confine it. There is not neceesarily the least danger that the disease will ottack even the constant attendant of the patient, if proper care ie taken. With the hooeeholder himeelf reets the entire responsibility of the origin of every case breaking ont in the houeehold. Thie ie a responsibility for which the community should hold him strictly accountable.

It may be assumed, without hesitation, that, whenever a pronounced case of typhoid breake ont in an ieolated country houee, or when any form of low fever occnrs, though it may fail to assnme a distinct typhoid character, there ie in that house, or about it, or in connection with its eupply of drinking water, eome accumnlation of neglected filth, some pile of rotten vegetables in the cellar, eome overflow from a barnyard, some spot of earth satnrated with the alops of the kitchen or some other form of impurity, to which the origin of the diseaee may be distinctly traced.

The *spread* of typhoid is very generally occaaioned by germs contained in the bowel discharge of fever patients; but the disease is conatantly originating iteelf where no snch cause exists, and every first attack is a plain indication that either at home or in eome house at which the patient has visited, one or two things has occnrred: (1) There has been an exhalation of poieonous organic gasee from a kitohen yard or from a neglected cellar, or from some other eonrce of bad air, which hse entered the lungs and planted there the germa of the diseaee; or (2) either in the food or in the drink of the patient, these germs, originating in the eame organic pntresoence, have found their way to the stomach.

In either case the *blood* ia attacked; the subject may have been efficiently robust and vigorone, or efficiently unsusceptible to infection, to have avoided a eerious or fatal illness; but in every inetance the danger haa heen incurred, and, when incurred, the danger muet be the same as in taking any other form of slow poison. This is not theory, but eimply a well established fact, demonetrated by long, careful and frequently repeated investigatiou.

This being the case, it lies directly within the province of every farmer to remove, while it is yet time, any source of infection to whioh hie house may be liable. Vegetables in any considerable amount should not he kept in the houee cellar, and at least once a week the floor of the cellar ehould he ewept and every shred of waste vegetables removed. Even when thie ie done, the cellar ehould be ventilated by a window or other small opening toward the quarter least expoeed to cold winde (and in aummer on every eide); the privy, if a privy ie need, ehonld he well away from the house, and especially far from the well, unless its contente are received in a tight box and entirely absorbed by dry earth or ashes, and even then freqnently removed; the chamber elope of the house aho ld never, under any circumstance, be thrown int the privy vault, nor into a porous cesepool, from which they can leach into the ground and through the ground for a long distance into the well, or into and around the fonndation of the house. The same diepoeal of the lignid wastes of the kitchen is desirable, but not eo absolutely important. It ie, however, important that thie ehould be led by an impermeable drain to a point well away from the houee and from the well; ewill and all manner of nondescript refuse material, snoh as ie sloughed off hy every houeehold in the ordinary course of ite living, should be removed at least daily from the near vicinity of the dwelling, and the vessels in which it accumulates shoold be frequently cleanaed and aired; manure heape should not be left to ferment and send off their exhalations at a point whence frequent winds waft them toward and into the dwelling, nor should the barnyard he allowed to drain (either over the surface or through a porous soil) toward the house or well.

If all these points are well attended to, and if the ordinary rulee of cleanlinees be observed in the houeehold, the membere of the family may be considered aa safe against attacks of typhoid fever.

Anæsthetizing During Sleep.—Prof. Dolbean describea at much length in the *Annals de Hygiene* hie varions experimente to ascertain whether a peraon can he anæsthetized during aleep. He mentions the case of three patients, who, while sleeping, were readily aroused by applying emall quantities of chloroform at no great distance from the nostrile. In another series of experiments, made on eeven patiente, ten drops of chloroform were poured on a napkin folded in four, which was gradually brought into the vicinity of the air passeges, so that all air inspired had traversed it. In all these cases the patients were aoddenly aroused from their sleep, some immediately and only one after the eleventh inspiration. A third group of cases coneisted of twenty-nine patiente. It was fonnd thet in ten out of thie number, that is in more than a third, complete anæsthesia could be induced without awakening them. Dexterity in the mode of procedure seemed to have eomething to do with the proportion thue obtained, for this increaeed progressively with the number of cases experimented upon.

Poisoned by a Hat.—A etrange caee of poisoning is reported from Stettin. A gentleman had bonght a hat in a shop there, and after having worn it one or two daye, was tronhled with unbearable headache. At the same time little ulcere formed upon hie forehead, hie eyee were inflamed, and the whole upper part of hie hesd was much ewollen. It wae evident that these symptoms were caused by the hat, and upon examination by a chemist, it wae found that the brown leather in the inside of the hat was colored with a poisonoue aniline dye. It appears that inflammation is nnavoidable when thie dye ie in contact with any part uf the ekin. Since the noxions qualities of so many of theee dyes are eo generally known it ie very careless, to eay the least, in manufacturers to make or use them before aecertaining that they may be applied without riek to health.

Crazed by a Blow.—A few days since a young mau named Michael Cavarley, about eighteen yeare of age, was struck on the neck by a friend while ekylarking in a saloon on Broadway. The blow occasioned considerable pain at the time, but no serioue reenlts were apprehended. The yonng man resumed work the next day, but toward evening wae compelled tu quit, hie miud becoming suddenly affected in a strange manner. He hae since become a raving maniac, and it is feared that he will have to be committed to the Insane Asylnm. What makes the matter more sad ie that an aged mother is dependent on the young man for her support.

Useful Information.

Steel Pens—How Made.—Steel pene, which are chiefly mannfactured at Birmingham, England, made from the best steel, which is firet rolled into narrow strips of the required width and thickness. These are then cleaned by the actiou of some dilute acid, and cnt by means of a pnnch worked by a screw press into flat blank pieces of the reqnired size. The name of the maker ia then stamped on eaoh pen, after which the blank is ourved into a nib, or a cylinder if a barrel pen ie required. Up to thie stage the ateel is worked in a eoft etate; the pene are now hardened hy being heated and cooled suddenly by immereion in oil, after which they are tempered to the required degree of elasticity, polished by heing placed with fine sand or some other polieh material in a revolving cask, and the nib ground to a fine point on a grindstone, or emery wheel. After thie the slit ie out by a chisel worked by a ecrew press, and the pens made ready for eale hy being colored and varnished. The manufacture ie chiefly carried on hy women, men being employed only to repair the toole. It is eetimated that 100,000,000 pens are manufactured annually at Birmingham. The principal demand for steel peua in the United Statee, and many countriee of Europe, ie enpplied from this source.

England Looking to America for Her Iron.—The profitable exportation of iron to England from one of the South-rn States has already been announced. Aud now American iron ore advices from New York make the intereeting announcement that an Englieh company has recently secured lands in the Kanawha valley, in West Virginia, with a view to the utilization of the loosl iron oree.

Wire Fencing.—A wire feuciug consietiug of two wiree twisted together, and armed at intervals with eharp barbs or points, is attracting some attention. The barns keep away cattle, and the twisting of the wires aots as a spring that compensatee for the contraction and expansion that sometimes proves so disastrous to the life of suoh fences.

Rosewoun.—It has puzzled many people to decide why the dark wood so highly valued for furniture ehould be called rosewood. Its color certainly doee not look like a rose, eo we must look for some other reason. Upon asking, we are told that when the tree is firet cut the freeh wood possessee a very strong, rose-like fragrance; hence the name. There are half a dozen or more kinds of rosewood treee. The varietiee are found in South America and the East Indiee and neighboring ielande. Sometimee the trees grow so large that planks four feet broad and ten in length can be cut from one of them. These broad planks are principally used to make tops of pienofortes. When growing in the forest, the rosewood tree is remarkable for its heauty, but anch is ita value in manufacturee ae an ornamental wood, that some of the foreets where it once grew abundantly now have scarcely a single specimen. In Madras, the government haa prudently had great plantations of this tree eet out, in order to keep up the sopply.—*British Trade Journal.*

A Mineral Paste.—A French chemist preparee a mineral compound of paste, which is said to be superior to hydraulic lime for uniting etune and receiving the aotion of water. It becomee ae hard as stone, ie unchangeable by the air, and is proof against the action of acide. It ie made by mixing together nineteen pounde of eulphur and forty-two poonde of pulverized etoneware and glaee; this mixture is exposed to a gentle heat, which melte the eulphur, and then the maee is etirred until it beoomes thoroughly homogeneous, when it ie run into molds and allowed to oool. It melte at abont 120° Cent., and may he re-employed without loes of any of ite qualities whenever it is desirable to change the form of an apparatue, hy melting at a gentle heat and operating ae with asphalt.

A Use For Bedbugs.—A oorrespondent uf the *Scientific American* eays: "If nice fat bedbugs are placed in a saturated solution of nitrate of potaeh in water, and exposed to the air for several days in an open veeeel, there will be no apparent ohange in the bngs; but there will be in the odor, for now it is ae delicate and delicious as before it wae rank and disgueting. No doubt the odoroue principle conld be easily eeparated, perhaps by digesting with alcohol or ether; and if neatly hottled and labeled, it would yield a large profit to practical perfumers. The odor is unlike that of any other perfume I have ever smelt, and no one would euspect ite low origin. Thie is one use for the *cimex*; there may he others."

Copper Alloy that will Adhere to Glass.—The following alloy of copper will attach itself firmly to surfaces of metal, glaee or porcelain: Tweuty to thirty parte uf finely blended copper (made hy reduction of oxide of copper with hydrogen or precipitation from solution of its sulphate with zinc) are made into a paste with oil of vitriol. To this seventy parts of mercury are added and well triturated. The acid is then waehed ont with boiling water and the compound allowed to cool. In ten or twelve houre, it becomee anfficiently hard to receive a brilliant polieh and to ecratch the surface of tin or gold. When heated it is plastic, but does not contract on cooling.

Curious Fact.—Friction impedes the progrese of the railway train, and yet it is only through friction that it makes any progress. Thia apparent paradox ie explained when we remember that hy reason of the frictional bite of the drivers upon the track, they draw the train. The bearinge of the wheel upon the raile are a mere line where they oome in contact, iron and iron, yet thie elight and almoet imperceptible hold is sufficient to move hundrede of tons of dead weight with the speed of the wind.

A Living Raft.—The leaves of the gigantic water lily known ae the *Victoria Regia*, in the Botanic Garden at Ghent, having attained a remarkably large eize, Mr. Van Hulle, the chief gardener, recently undertook to determine their buoyant power. One leaf easily supported a child, and did not sink under a man. Mr. Van Hulle then heaped bricke over its entire area and found that, before the leaf became aubmerged a weight of 761 lhs wae floated.

Chiming Clock.—A large olock, striking the hnurs, aud playing the Cambridge ohimes, hae jnst heen placed in the parish church at Syston, Leicestershire. The movement is a good epecimen of mechanical skill, having all the latest improvements, inclnding Denison'e double three-legged gravity escapement. Mr. Smith of Derby, hae carried out the work.

A Profitless Speculation.—It is said that the great and costly St. Lonis bridge, dedicated with such a flourish of trumpete a year ago, ae a speculation, is proving a failure. It don't earn enough to begin to pay the interest on the bonde, the first and second issues of which the amount of $9,000,000,000 were negotiated in London, aud there ie talk of a foreclosure.

Shoeing Vicious Horses.—In Guernsey it appeare that etherized vapor is used to tame vicious horees during the operation of shoeing, and with favorable results.

To cut glaes to any ehape without a diamond, hold it qnite level under water, and, with a pair of strong sciseors, clip it away by small hits from the edges.

A putty of etarch and chloride of zino hardens quickly, and laats, ae a stopper of holes in metals, for months.

Domestic Economy.

The Value of Eggs for Daily Food.

Wonld it not be wise to aubetitute more eggs for meat in our daily diet? About one-third of the weight of an egg is solid nutriment. This is more then can he said of meat. There are no bones or tough piecee that have to be laid aside. A good egg is made np of ten parts shell, sixty parts white and thirty parts yolk. The white of en egg conteine eighty-six per cent. water, the yolk fifty-two per cent. The average of an egg is about two ouncee. Practicelly an egg is animal food, aud yet there is none of the disagreeable work of the hntcher neceeeary to obtain it. The vegeturians uf England nee eggs freely, and many of theee men are eighty and ninety years old, and have been remarkably free from illnese. Eggs are best when cooked four minntes. This takes away the animal taste that is offeneive to some, hnt does not eo harden the white or yelk ae to make them hard to digeet. An egg if cooked very hard is difficult of digestion, exoept by those with stout stomache; snoh eggs ehould be eaten with bread and maetioated very finely. An egg epread ou toest is fit for a king, if kinge deeerve any better food than anyhody else, whioh is douhtful. Fried eggs are leee wholesome than boiled onee. An egg dropped into hot water is not only a clean and wholeeome but a delicious moreel. Moet people epoil the taste of their eggs by adding pepper and salt. A little aweet butter ie the best dreesing. Eggs contain much phoephorone, which is supposed to he usefnl to those who use their hrains much.—*Poultry Review.*

Arranging Furniture.—In arranging furniture about a room, hear in mind that it is not neceeeary to push every article primly out to the sidee, so that sofas and chaire look ae if they were glued to the wall. Pull them out; put a eofa across one corner; stand the big easy chair in the light, with a little table close by, handy for sewing or books; leave a chair or two in front of the sofa; and in general so dispose the articles that the room shall not appear ae if its ownere never entered it save on oeremonial occasions. Whether a room is pleasing and cozy or not doee not depend npon the elegance or costlinees of ita fittings. The simpleet furniture, if tastefully orranged as regarde color and poeition, often looks hetter than the handsomest prodocts of the oabinet maker's skill.

Carving.—Fifty years ago the art of oarving wsa regarded by the most polished society in England and in this country as the indispensable accomplishment of every lady who had to preside at the head of her table. It waa a reflection upon her fitneee for that poet to eay that she managed the oarving knife with little skill, or was ignorant of the ohoice parts of each dish. Fsshion has ohanged all that, and the office of carving is now assigned chiefly to gentlemeu; but there is no reasou why ladies shonld not know all the niceties of the art, and be able, when oiroumetances require to preside with eaee and skill at the head of the table. A good carving knife, fork and steel reuders thie office a pleasure to the accomplished carver.

How to Take Care of Furs.—Ladies, it has been remarked, as a general rule, imagine the care of putting away fura is all that is required; they think they can wear them when and where they pleaee, provided they expend a few pence for camphor when they lay them aside. This idea ehoold be correoted. More harm is done to furs by wearing them a week after the weather has become warm, than during a whole oold eeason. When they are put aeide they ehould he brushed the right way with a eoft brueh, an old linen handkerchief folded emoothly over them, and a piece of gum camphor kept in the hox all the time, to scare Intruders in the shape of moths.

Celery Salad.—Chop one medium sized head of cabbage and three bunches of celery very fine. Take one teacup of vinegar, a lnmp of butter the eize of an egg, one teaspoonful of mustard, one of cayenne pepper and two of sugar, and the yolke of two eggs. Mix well and beat, stirring constantly until it thickens. When oold, add two tablespoonfnls of nich eweet cream and pour over your ealad.

Tapioca Tarts.—Soak four tablespoonfnls of tapioca over night in water sufficient to cover. Add one pint of oold water and simmer gently until clear and thick, stirring in two tablespoonfnls of white sugar mixed with one tablespoonful uf lemon juice. If not eweet enough add more sugar. Lemon extract can be used instead of juice. Fill paste orusts, sprinkle crimson sugar over and bake.

Orange Pie.—Grate the peel of one fresh orange; take the pulp and juice of two large oranges; add to them one cup of sugar and the beaten yolk of three eggs; mix one cnp of milk with the whitee of the eggs beaten to a stiff froth. Bake in pnff paste.

To Cleanse a Crape Shawl.—Wash it in warm ends made of white soap dissolved, rub the spots gently eo ae not to injure the texture, riuse in blue water and twice in lukewarm water, aud pin to dry.

German Batter Cake.—A Tomales oorrespondent enquiree for a good receipt for German batter cake. Who can furnish it?

TABLE OF CONTENTS.

GENERAL EDITORIALS.—Signaling Apparatus for Railroad Traine; Improved Chisel Tooth Saw, 33. General News Itams, 37. Blasting by Electricity; Tempering Mining Picks; Prospect-holes and Shafts; Notices of Recent Patents, 40. Short Lectures on Patents; Ryder's American Fruit Drier; Machine for Removing Broken Drills from Holes; A "Thatched Cottage," 41. Patents and Inventions, 45.

ILLUSTRATIONS.—Hoe & Co.'s Improved Chisel Tooth Saw, 33. A Thatched Cottage; Apparatus for Removing Broken Drills from Holes; Ryder's American Fruit Drier, 41.

CORRESPONDENCE.—Drift Mining in Plumas and Sierra Counties; Mining at Bingham, Utah, 34.

SCIENTIFIC PROGRESS.—Solar Heat—A Popular Fallacy; The Missing Link—Perhaps; Straightening Tall Chimneys; Scientific Premium; Preservation of Metallic Sodium; A New Use of the Sand Blast; Discovery of the Phylloxera Remedy; Magnets for Electro-Motors; How does a Spider Make its Web? Recording Speech Automatically, 35.

MECHANICAL PROGRESS.—Re-Carbonizing of Steel; Hydraulic Riveting Machine; Artificial Riveting Machine; Artificial Hardening of Sandstone; Lining Boilers with Copper; A Novel Mechanical Appliance; The first Planing Machine, 35.

MINING STOCK MARKET.—Sales at the San Francisco Stock Board; Noticee of Assessments; Meetings and Dividends; Review of the Stock Market for the Week, 36.

MINING SUMMARY from the various counties in California, Nevada, Arizona, Oregon, Montana, Idaho and Utah, 36-37.

GOOD HEALTH.—Typhoid Fever—Cause, and How to Avoid It; Anesthetizing During Sleep; Poisoned by a Hat; Crazed by a Blow, 39.

USEFUL INFORMATION.—Steel Pens—How Made; England Looking to America for Her Iron; Wire Fencing; Rosewood; A Mineral Pasts; A Use for Bedbugs; Copper Alloy that will Adhere to Glass; Curious Fact; A Living Raft; Chiming Clock; A Profitless Speculation; Shoeing Vicious Horses, 39.

DOMESTIC ECONOMY.—The Value of Eggs for Daily Food; Arranging Furniture; Carving; How to take Care of Pure; Celery Salad; Tapioca Tarts; Orange Pie; To Cleanse a Crape Shawl; German Batter Cake, 39.

MISCELLANEOUS.—Steering Balloons; The Bonanza; New Smelting Works in Colorado; Amarynth; A Mill for the Goodrich, 34. Mining Patents, 37. Idaho Mines; Have we Diamond Mines? The Second Arctic Expedition; Natural Gas for Fuel; Belting and Gearing; The Sumner Mine; The Hollsran Coal Mine, 38. Industrial Items, 45.

MR. W. C. QUINBY, business manager of the American Commercial Agency, left on the steamer *Montana*, on Thursday, for the International Exposition of Chile. Mr. Quinby represents some 150 leading firms at the Exposition, and has taken with him a large assortment of merchandise and machinery from California merchants and manufactrers. He will represent these firms at the Exposition and remain in Chile sometime afterwards, establishing agencies for the sale of California and Eastern goods. He hopes to build up a trade between the two countries, which will be of benefit to both. He is special agent and correspondent of the San Francisco *Journal of Commerce*, which paper will issue a Spanish edition, filled with California advertisements, during the continuance of the Exposition. Mr. Quinby, as an active and energetic man, seems especially well qualified to carry out the business he has undertaken. We anticipate that his visit to Chile will be of benefit to California trades and manufactures. The Exposition opens September 16th, 1875.

INDUSTRIAL FAIR AWARDS.—The Board of Managers of the tenth Industrial Fair of the Mechanics' Institute of S. F., held their first meeting at the pavilion last evening. They let the carpenter work contract to J. R. Wilcox for $3,500, and the gas-fitting contract to S. N. Gruhb, for $220. The Committee on Power and Machinery was instructed to have 120 feet additional main shafting put in place. The following privileges were awarded: Candy stand No. 1, Vogley & Bro., for $625; stand No. 2, to Geo. Haas & Co., $200; cider stande, Noe. 1 and 2, to Preble & Co., $299; newspaper and job printing, card frames and all other special advertising privileges to Dewey & Co., $1,900; restaurant privilege, to A. M. Hedburn, $1,050.

A SCHOONER built for Haywood and Harmon, of this city, was launched at Port Ludlow, W. T., last week. She is named the *Ida Schanner*, and is 225 tons measurement.

Blasting by Electricity.

One of the most useful purposes to which electricity is applied is that for blasting in mines and quarries and for submarine operations of a similar character. This novel use of the electric spark was first introduced in mines by Martyn Roberts. The first to apply it to submarine operations was Major General Pasly, who employed it in blowing up some sunken vessels on the Thames.

The advantages of blasting by this agent are numerous and important; one of the chief of which is the increased effects derivable from a given amount of powder from the fact that no pressure is removed by the vent formed through the tamping by the burning of the safety fuse. Careful estimates have shown that at the instant of discharge there is a pressure of two hundred atmospheres. In a hundredth part of a second thereafter, and before the impact can be communicated to the rocks to be ruptured, there is a decrease in the pressure of fully twenty-four per cent. by the escape of gas through the hole left by the fuse. The excess of powder thus required also calls for the drilling of holes proportionately larger, at increased expense.

Another advantage of electric blasting is dependent on the fact that the heat is not applied until the instant it is wanted, and then the explosion is instantaneous; whereas in the employment of the fuse, it frequently takes place before or after it is expected, and very often when the miner is approaching to learn the cause of delay. Every miner will remember instances of this kind. A series of blasts can be instantaneously fired by electricity, producing a much greater effect than a series of blasts with fuse, the explosions of which cannot possibly be made to act simultaneously.

As to the economy, safety and efficiency of blasting by electricity, there can be no possible doubt, when any considerable amount is to be done. Its employment in all large mines has become almost universal. The process and manipulation for this mode of blasting is easily acquired by any person of ordinary intelligence. The method of charging the hole and connecting it with the battery, is the most delicate and intricate part of the work, yet when once understood it is extremely simple, and requires nothing but care and attention.

There is absolute immunity from danger except in the case of gross carelessness, for so long as the two battery ends of the wire are disconnected from the battery it is impossible for the electric spark to start on its mission. The usual danger from tamping is of course always present, but it is in no way increased by inserting the electrical wire in the charge, which is made of copper except the half inch or so for making the connection, for which a fine platinum wire is usually employed.

Tempering Mining Picks.

There is probably no service to which steel can be put, which so effectually tests its value, as in mining picks. The tempering of a pick is a very nice piece of work and should be done with great care. In the first place a good charcoal fire is necessary; next, good steel, and then a good light hammer with a smooth-faced anvil; and lastly, a man is needed with a good keen eye, considerable experience and excellent judgment. No good pick can be turned out if any of the above essentials are wanting in the process.

A pick should never be "upset," or hammered endwise, nor raised above a full red heat. The steel should be, moreover, heated as quickly as possible, as long exposure to heat—even if that heat is not in excess—injures its texture. Many blacksmiths find great difficulty in tempering picks, because they do not choose good steel. After being heated the pick must be worked with care, special pains being taken in drawing it out, to hammer on a l sides alike, in one place as much as another, and on one side as much as another.

When ready for hardening, it should be heated in the blaze of a charcoal fire until red hot, and then plunged into cold rain water, and kept there until it is nearly cold; but if kept too long in the water or until it is quite cold, the corners are liable to fall off. Some blacksmiths use salt water; no salts of any kind should exist in the water, but the water should be cold; if the water is warm, and a little ice should be thrown in to chill it, the tempering will be all the better. Pure soft water for hardening will make a tougher pick, and one less liable to crack at the edges than where salt water is used.

An old mining partner of the writer's, who always sharpened the picks at the claim, and was quite expert at it, used to hold the pick end in the water for just exactly a certain length of time until a certain shade of color appeared. Then he did not consider it properly tempered until the point was inserted in the ground and allowed to gradually cool. The last hammering of a pick should always be given on the flat sides, across edges to the edge and then upon each side about an inch. By so doing the corners will be less liable to crack off. The same process will work well with all edge tools. Good, well proportioned and well tempered picks in mining operations, are very important, and sharpening should never be intrusted to unskillful hands. Should the careful experience of any of our readers disprove anything of the above, or suggest anything new, we should be happy to report the same.

Prospect-holes and Shafts.

Although capital is one of the principal necessities in new mining districts and in opening up new mines, it is by no means the only necessity required. People must have a pretty clear understanding that the mines to be worked are apparently worth the expected outlay, and considerable more, or they will have nothing to do with them. A good many prospectors have not rid themselves of the idea that as long as they have a few croppings of pretty good ore and a fifteen-foot "shaft" on their claim, they ought to be paid well for the property.

The mining men, or mining capitalists, are not as green by any means as the investors of fifteen years ago. They know as well, and perhaps better, what is worth developing, than the persons owning the claims. Their experts of course look out for the interests of their employers and very naturally discourage investments in entirely undeveloped property. No expert can pass judgment, favorable or otherwise, on a ledge upon which there has been no work done except to sink a shaft fifteen or twenty feet deep. He will not risk his reputation in making any assertions on the matter one way or another. Nor is he to be blamed, either, since no man, ignorant or educated, can promise to foretell anything about a mine unless he has something upon which to base calculations. If there are several shafts, drifts or tunnels, and he can examine the vein in several places, he may be able to compute the probable amount of ore, or its approximate value, but with nothing but a small hole in the ground he can form no reliable opinion.

It behooves miners, therefore, before they ask the assistance of capitalists, to develop their claims sufficiently for the capitalist or his expert to form some idea of what is for sale. No one wants to buy a pig in a bag; they want to see the pig's head at least, so as to make some kind of a guess at his weight and size. In many cases miners have waxed wroth at the apparent stupidity or neglect of capitalists, when in reality it was their own fault. If a man comes and says he has a "mine" with a shaft fifteen feet deep with ore of such and such a class, etc., the capitalist does not want to listen to him, for he knows if he went to the mine he could form no opinion of its value. But if a man says his shaft is seventy-five or one hundred feet deep, his tunnel one hundred or two hundred feet long, his drifts and winzes of respectable size and his claim in order, the intending purchaser will listen to him and examine his property.

During the quicksilver excitement within the past year many cases of this kind have occurred, and many a prospector was disappointed at the rebuffs he met in trying to dispose of his claim. While the capitalists have perhaps much to answer for, they ought not to be blamed for turning up their noses at mere prospect holes, especially when cinnabar was supposed to be at the bottom of them.

The remedy for this lies in the miner's own hands. They must either take prospect holes prices for prospect holes, or develop them into mines to get mine values. It will be said they are unable to do this but they must not then blame the men of money for not paying as much for a piece of ground with a hole in it from which dirt can be shoveled to the surface with a long handled shovel, as they would for a mine with a deep shaft and some chance to determine its value. Don't wait for capital. If your mine is good, work at it, put it in order, and the capital will come in time.

Progress at the Sutro Tunnel.

The following is the report of progress in the Sutro tunnel, for week ending July 8, 1875:

Number of feet in tunnel, July 1	9 938
Number of feet driven during week	41
Distance in, July 8	9,979

Details of work performed are as follows, heading being 8x10 feet:

Holes drilled	173
Holes blasted	193
Average depth	6.24 feet
Powder consumed	359 lbs
Exploders consumed	201

ROCK.—Andesite, the hardest rock yet encountered, but blasting tolerably well.

WATER.—Sixty-nine miner's inches flowing. None in face.

REMARKS.—Lost twenty four hours in celebration of July 4th and twenty-four hours on account of defective electric wire, besides several more spent in attempting to repair and make wire efficient, nearly two and one-half days in all, clear loss of time. Everything now working smoothly again.

[Signed] A. SUTRO, Gen. Supt.

AT the Chollar-Potosi mine the preparations for the erection of the immense hoisting works and machinery, to be used in sinking this shaft, is making very favorable headway, and the whole will be put in readiness for future operations at the very earliest moment possible.

Notices of Recent Patents.

Among the patents recently obtained through Dewey & Co.'s SCIENTIFIC PRESS American and Foreign Patent Agency, the following are worthy of mention:

HAY PRESS.—John Dugan, San Francisco. This invention is an improvement in horizontal baling presses, and in the means of operating them, so that great power can be had in pressing a single bale and after the bale is finished to return the followers to their original position without delay. The body of the press is set on low wheels so as to be easily moved and give room enough for a man to enter beneath the press to tie the bale after it is pressed. Within the body two followers are fitted, which are moved to and from the center of the press. Three doors are fitted to the top of the press, and when the followers are separated so that they stand at opposite ends of the box, hay is thrown in until the press is full. If it is necessary to tramp it, the work can be easily done by one man moving from one end to the other until the box is full. The doors are then closed and secured, and power is applied to force the followers toward each other, thus compressing the hay towards the center of the press. When the bale has been formed, the strings are easily passed down through the vertical slots in the faces of the followers, and passing through the slots in the bottom of the press, can be tied from beneath. A side door is then opened to remove the finished bale and the followers drawn back to the ends of the box to admit another bale. In order to operate the followers the inventor provides a mechanism which is constructed as follows: Across the lower part of the body two shafts are extended turning in suitable boxes, and to these shafts, where they project beyond the sides of the press, ropes or chains are attached. These ropes are led over the pulleys near the end of the press, thence over pulleys just above the shafts, and from these pulleys the chains pass over pulleys which are secured to the ends of the bars of the followers, these bars projecting through slots in the sides of the box. From these pulleys the chains extend to where they are secured to the frame. The chains work in pairs, one pair upon each side serving to operate each follower, and it will be seen that by rotating the shafts the chains will be wound upon them and the followers drawn toward each other. In order to operate these shafts simultaneously and in the proper direction, pinions are fixed to the ends of each and a spur wheel is mounted upon a shaft in a line just above, so that when the wheel is revolved it will turn these and the shafts. The drum which receives the rope for applying power is secured to the side of the gear wheel, and when the power is attached to the rope the gears and shafts can be revolved. In order to return the followers to the ends of the press after a bale is finished, the inventor attaches a rope to the middle of each of the followers at the back and lead them thence through the ends of the press and over suitable pulleys. When the horse is driven back after having pressed a bale, these ropes are so attached that the followers will be simultaneously drawn back to the ends of the press. Suitable guides steady the followers in their movements.

CAR COUPLING.—A. V. Anderson, Virginia City, Nev. This invention relates to certain improved attachments to be applied to the ordinary link and pin coupling, which is used for connecting two cars of a railway train together, and the object of the attachment is to provide for automatically handling the link pin from the roof of the car, so as to obviate the necessity of any one going between the cars to guide the link and drop the pin. By this arrangement the coupling is operated entirely by a person standing on the roof of the car and entirely out of the way of harm.

AERIAL TOY.—Peter B. Fernandez, San Francisco, Cal. This little toy consists of a propellor of considerable size, mounted upon a shaft at one end of a horizontal arm, which is supported at some point in its length, so as to be revolved about its vertical axis by means of the impetus given to it by the rotation of the propellor. A suitable case is provided to hold the mechanism for rotating the propellor and a counter-balance may be mounted at the opposite end of the arm. The toy as made by the inventor has a representation of a balloon having a netting and car, so that by operating the mechanism the balloon and car are set in motion.

PREPARING COCOANUT.—Alexander P. Ashbourne, Oakland, Cal. This invention relates to an improved process for the preparation of cocoanut for domestic uses, and by this process the inventor is enabled to so perfectly prepare the article that it will keep fresh for many years.

THE Ophir mine is to be shut down about the 20th of the present month for the purpose of retimbering about 300 feet of the shaft, and the putting in of a new gallows frame. This will take some time, and the present increase in the amount of ore extracted is to keep the mills going while the mine is shut down.

THE Belcher air shaft will soon be completed to the 1300-foot level, and is doing most excellent work in ventilating the lower levels of the mine.

Short Lectures on Patents.

No. 11.—By J. L. Boone, of Dewey & Co's. Mining and Scientific Press Patent Agency.

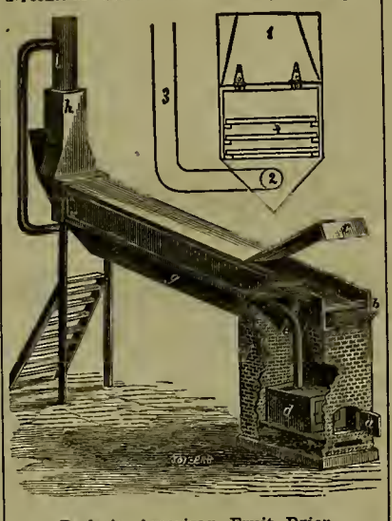
The Patented Article.

It is a provision of Patent Law that an invention, to be patented, must not have been in public use or on public sale for more than two years prior to the application for a patent, and has been held by the courts, and is now a permanent rule of Patent Law, that an inventor can make, use and sell his invention for two years, and then apply for and obtain a valid patent for it, notwithstanding such use. But he must not continue the manufacture, sale and use of the invention more than two years before applying for a patent, or the patent when obtained can be avoided. If it can be shown in any suit which involves the validity of a patent that the use and sale prior to the application was continued even one day over two years, the patent will fall. "A public use has been defined to be a use in public, and a single well authenticated instance of a use in public, whether by the inventor or any one else, constitutes a legal public use." This preliminary use of an invention is intended for the benefit of the inventor, for it is no more than right to allow him sufficient time and opportunity to thoroughly test the value and utility of his invention before he goes to the expense of applying for a patent. But few inventors take advantage of this provision of the law. They know too well that if they do so, many contingencies may arise which will cause them trouble and expense both in obtaining their patents and in sustaining them after they are obtained.

If an inventor manufactures and sells his invention before he applies for a patent, he is not entitled to mark the manufactured machines or articles with the words "Patent applied for," yet if he should do so I do not know of any harm that could come to him for so doing. It would only be a deception of the public which could in no case do any harm and might be a great benefit to the inventor by deterring others from manufacturing the articles. Neither has a caveator the right to mark the invented articles with the words "Patent applied for," because a caveat is not an application for a patent. He could, however, with full propriety, mark the articles or machines with the words, "Invention Secured" or "Right Secured," because a caveat is supposed to secure the rights of the inventor while he is testing his invention, and these words in all probability would answer every purpose quite as well as the words, "Patent applied for." After a patent has been applied for, and before it is obtained, it is usual for the inventor to mark each article or machine that he manufactures with the words "Patent applied for," but it is entirely optional with him whether he shall do so or not. It is better to do so, as it notifies the public that the inventor has taken the proper steps to secure his patent, and that any one who makes and sells the invention is liable to encounter trouble when the patent issues, as the patentee has a right to prosecute the user of a machine that infringes his patent whether the machine was made before or after the issue of a patent unless he gave permission to the manufacturer to make and use it, in which case the permission would be regarded as a special license, which would remain with the machine even after the patent was issued. After an inventor has obtained his patent, the law expressly declares that it shall be his duty, and the duty of his "assigns and legal representatives, and of all persons making or vending any patented article for or under them, to give efficient notice to the public that the same is patented, either by fixing thereon the word 'patented,' together with the day and year the patent was granted, or when, from the character of the article, this cannot be done, by fixing to it or to the package wherein one or more of them is enclosed a label containing the like notice, and in any suit for infringement by the party failing so to mark, no damages shall be recovered by the plaintiff, except on proof that the defendant was duly notified and continued after such notice to make use or vend the article so patented." In other words the law leaves it to the discretion of the patentee whether he will mark each article with the word "patented" and the date of the patent, or whether he will omit the marking and take the chance of discovering infringers and notifying them personally that they are infringing. In the latter case no damages could be obtained for what the infringer done before he received a notice from the patentee, while in the former case the marking of the articles is a public notice, and no other notice need be given. The better policy is to mark each article or machine before it leaves the hands of the manufacturer. The inventor is then better able to keep track of his machines and detect infringements. Most manufacturers, besides marking each article with the date of the patent under which they are manufactured, number them consecutively. This is an excellent plan, because it establishes the identity of each machine or article, so that it can be recognized from infringements. It is a public offense for any person to affix to or mark upon anything made, used, or sold by him for which he has not obtained a patent the word "patented," or any word of like import, with the intention of imitating an article which is patented, or for the purpose of deceiving the public into the belief that the article is patented. The penalty for such an offense is a fine of not less than one hundred dollars with costs, and one-half of the penalty will go to the person who sues for it. After a patent expires the inventor or manufacturer of the article for which the patent was granted has no right to mark them with the words "patented," but he must cease marking them altogether or he will be liable to the law in the penalty above mentioned for false marking. Richardson had a patent on a leather splitting machine, which he called during the life of the patent, "Richardson's Patent Union Leather Splitting Machine," but it was held that after his patent expired he had no further right to use the word "patent" in the name of the machine, because it tended to deceive the public.

Those parts of a machine which are not covered by the claims in a patent can be varied at pleasure by the patentee or manufacturer without affecting the patented part or parts. For instance, if A secures a patent on an "improvement in wagon wheels," and the claim in the patent covers only the method of securing the spokes in the hub of the wheel, he can apply his invention to any kind of a wheel, and he can use any kind of spokes and felloes that he pleases without departing from the spirit of the patent so long as he does not infringe the patent of another and retains the feature covered by his claim; and this is the case even if he has described in his specification one particular kind or style of wheel, and afterwards applies his invention to an entirely different wheel. The description of the old parts of a machine in a specification serves only to illustrate and explain the operation of the invented part and its connection with an entire machine.

Even the patented part, which is covered by the claims, can be varied if the features or functions which render it novel and patentable are retained. The law provides that a patent shall cover all devices which are equivalent to the parts claimed in a similar application of them, and the inventor can employ in the manufacture of the machines or articles any known mechanical equivalent of what he has claimed in the patent. "When a party has discovered a result as well as the machinery which pro-



Ryder's American Fruit Drier.

duces it, and introduces it in a practical form to his fellow men, he is the inventor, not merely of the mechanism, but of the force which operates through the mechanical medium. He has a right to assert and establish his property, not only in the formal device for which mechanical ingenuity can at once, as soon as the principle is known, imagine a thousand substitutes, but also in the essential principle which his machine was the first to embody and announce to mankind." This is the law plainly stated, and if such were not the case but few patents would be worth the paper they are printed upon.

Ryder's American Fruit Drier.

Some time since we gave a description of Ryder's American fruit drier, which has since, however, been greatly improved. The improvements can be seen by reference to the accompanying engraving: *a* is the door to the furnace; *b*, door for entering trays; c, fall door for covering the top of furnace and end; *d*, is the stove, entirely inside the furnace; e is the pipe from stove entering the improved hot air chamber; *f*, is the furnace, which is made of narrow tongue and grooved flooring, lined with zinc, or it can be made stationary of brick; *g* is the improved additional V-shaped hot air chamber through which the pipe lays, and is lined with zinc. The wooden fine, *h*, opens below into the hot air chamber to carry off the moisture, aided by the draft of smoke; *i* shows the pipe coming out of the upper end of the drier, as shown at 2, and entering the pipe flue at *l*. Fig. 1 shows the fall door which closes the upper end of the drier, and the dotted lines show the form of fine, as at *h*. Fig 3 shows the pipe as at *i*. Fig 4 shows trays at upper end. In drying cut fruits, such as apples, peaches and pears, the true principle is to subject them to a current of dry heated air, so as to dry the cut surface quickly, which prevents discolroation and makes an artificial skin or covering, and hermetically seals, so to speak, the cells which yield glucose or fruit sugar. It is claimed that the correct principles are practically applied in combination with a perfected mechanical arrangement in this drier, by which a current of dry heated air—automatically created—is made to pass underneath and around the fruit on the trays and then pass over them, carrying the moisture arising from the fruit out of the machine, without interfering with or passing through the trays above, the strongest heat being concentrated upon each tray when it first enters the drier. The machine has had practical tests on different kinds of fruits. The "factory drier" is four feet wide and twenty feet long, with three lines of trays on castors, and a capacity of from 350 to 400 pounds of dried fruit per day. A machine two feet by twelve with one line of trays, has a capacity of from forty to sixty pounds. J. M. Keeler & Co., 330 Sansome street, will furnish additional particulars to those desiring them.

Machine for Removing Broken Drills From Holes.

The apparatus shown in the accompanying engraving is an invention recently patented through the agency connected with this office, by John W. Platt, of Mineral City, Nevada, and is intended for removing stubs and broken pieces of drills from holes. We mentioned this device a short time since in the Press, and now give an illustration of it, by which it can be more clearly understood.

The operating mechanism is enclosed and protected by a case, *D*. Two gripping jaws

Apparatus for Removing Broken Drills from Holes.

are so curved as to form cylindrical sections, with roughened inner faces, as shown. The ends of these jaws are tapered to a blunt apex, and they are scarfed to an edge also, this being for the purpose of making it easy to work the jaws down through the rock and dirt that may be in the hole surrounding the stub. The sides of the jaws taper toward each other at the top, and unite so as to form a transverse cylindrical head. This head is fitted into a hole, *b*, bored transversely through the lower end of the stem, and a slot opens downward from the hole to allow the sides of the jaws to pass in. The stem, *C*, passes up through a cylindrical sleeve, or case, *D*, within which it is protected, and the upper end of the stem has a screw cut upon it, so that the handle or elongated nut can be turned up or down as desired. A stationary handle is fixed to the top of the stem, and by this is held while the nut is being turned.

This device is operated as follows: If a drill becomes broken in the hole the nut is turned back, and the elasticity of the sides of the jaws causes them to spread apart and draw out of the case until they are sufficiently well opened to pass down upon each side of the drill. The stem is now twisted from side to side by means of its handles and the jaws will be worked down upon each side of the broken stub so as clasp it. Now, by turning the nut or handle, the cylindrical case will be forced down over the jaws, thus forcing them together and causing them to compress the steel firmly, so that the whole can be withdrawn, the operation not occupying more than a minute or two, even in holes three or four feet deep.

If the jaws should become broken or injured it will be only necessary to remove the handle and nut so as to allow the stem to be slipped out, when the head will easily slide from its socket, and can be replaced by another.

The agents of this device in San Francisco, are Fleishman, Sichel & Co., 37 and 39 Battery street, and in Virginia City, Nev., Platt & Storer are agents, who may be addressed for further information. The device has been in use in several mines for some little time, and we are informed has given great satisfaction.

THE

Mechanics' Fair Daily

—OF THE—

TENTH INDUSTRIAL EXHIBITION

[Circulation Free]

Will be a superior publication, and contain all

Official Information

During the Exhibition, commencing Aug. 17th, 1875.

Its Illustrations

Will furnish accurate views of

New Inventions and Machinery.

The volume will give a substantial and readable

Record of the Fair,

Quite valuable for reference and preservation, in addition to a goodly variety of other reading matter, daily, embracing

Graphic Paragraphs and Humorous Incidents,

Making altogether a paper eagerly sought for (both in and out of the Pavilion) by nearly a

Quarter of a Million of Readers!

During the term of the Exhibition—a circulation reaching a greater number of different individuals than that of any publication yet issued. We shall make a specialty of inserting

Attractive Advertisements,

Representing the leading firms in nearly

Every Branch of Trade and Industry

On this coast, upon favorable terms, soliciting such as we believe will be most benefited by advertising in a well conducted, enterprising and everywise meritorious journal. We contemplate

An Advance Edition of Ten Thousand Copies

Of the first number to be circulated gratuitously

All Over the Pacific Coast

In advance of the opening of the Fair.

This beautifully illustrated sheet, issued upon such an occasion will receive close attention, and its contents—both reading and advertising being original—will be closely scanned throughout.

The Immense Pavilion

Has been enlarged for the coming Fair. An unusually large amount of space for exhibits has already been engaged. Stimulated by the list of premiums offered this year the exhibition will doubtless be a

Grand Success.

Orders for advertising, sent in early, will receive careful attention.

The undersigned publishers of the Mining and Scientific Press have successfully issued a popular daily in the Mechanics' Fair during six Industrial Exhibitions since 1864, and we are now confident of making the coming volume surpass all its predecessors in its standard of value as a reading journal of art and information and a medium of first-class business announcements.

We have been awarded by the managers of the Exhibition, the

Exclusive Publishing and Advertising Privileges

Of the Tenth Industrial Exhibition, and are determined to accomplish a work creditible to the Mechanics' Institute, to Our Patrons, and to Ourselves.

DEWEY & CO.,

Publishers and Patent Agents, No. 224 Sansome Street, S. E. Cor. of California, S. F.

Tenth Industrial Exhibition of the Mechanics' Institute, S. F., 1875.

PRELIMINARY ANNOUNCEMENT.

The Board of Managers of the Tenth Industrial Exhibition have the pleasure of announcing that an Industrial Exhibition will be held, under the auspices of the Mechanics' Institute, in the city of San Francisco, to be opened on Tuesday, the 17th of August, 1875, at 11 A. M., and to continue open at least one month thereafter.

In making this public announcement, the Managers desire that those who intend to exhibit should send in their applications for space as early as possible, so as to avoid the necessity of exclnding, as has been the case heretofore, the many desirable exhibitors who are unusually tardy in making applications.

The forthcoming Industrial Exhibition will be the tenth held under the auspices of the Mechanics' Institute, and the Managers are justified in saying that it will undoubtedly surpass in completeness of detail and general arrangement any heretofore held.

The last Exhibition was attended by 700,000 visitors, attracted hither by the fame of these Industrial Fairs, and for the purpose of investigation, business and pleasure.

All the available exhibiting space was applied for several weeks before the day of opening, and the Managers were compelled to deny admission to many desirable exhibits.

The Board of Managers desire particularly that the arts, the industries and natural products of the country should be well represented at the forthcoming exhibition, and no pains will be spared to make these classes of exhibits a special feature there.

The Exhibition will be held in the building constructed for that purpose in 1874, but it will be materially enlarged and improved in many details for the Exhibition of 1875.

The space under roof will exceed 180,000 square feet, or about four and a half acres, exclusive of the Horticultural Garden, which will occupy 24,500 square feet additional.

The location of the Exhibition Building, on Eighth street, between Market and Mission streets, cannot be surpassed for convenience and accessibility, and can be approached from every part of the city by means of the various lines of street railroads, any of which bring visitors within two blocks of the entrance gate.

The utmost care has been exercised in providing for ample ventilation and light, and during the evening the building is brilliantly illuminated by over 5,000 gas lights.

The promenade avenues are broad, and 3,000 seats are provided for the comfort of visitors, for whose convenience there is also an excellent restaurant, under the management of a first-class restaurateur.

Every afternoon and evening the best orchestra the city can supply will discourse excellent music under the direction of an accomplished leader.

The building is always well attended by visitors, and during the last Exhibition over 29,000 were daily admitted for a number of days, and under no similar circumstances can the manufacturer, the mechanic, the inventor, producer or business man so advantageously place himself before the people of the Pacific Coast.

Persons desiring to obtain information, or to make application for space, should address "Managers of Tenth Industrial Exhibition, San Francisco, California," or make personal application as below.

It is expected that the various transportation companies will convey goods intended in good faith for exhibition, at half the usual rates.

Exhibitors from abroad, if they have no agent or consignee in San Francisco, can consign goods and mark the same to the "Manager of the Tenth Industrial Exhibition, 17 Post street, San Francisco," and they will be stored, if they arrive before the day of opening, free of expense; but no charges or expenses for freight or forwarding, etc., will be paid by the Managers.

In order to secure space, application should be made on or before July 20th, 1875.

Blanks will be furnished on application.

Premiums will be awarded as follows, viz: 16 gold medals, 50 silver medals, Society Diplomas, Certificates of Merit and Special Premiums, as the Board may determine.

Blanks for space can be obtained at the Mechanics' Institute on application by letter or otherwise; and any information will be given, by applying to any member of the Board of Managers, as below:

A. S. HALLIDIE.....113 Pine street.
JAMES C. PATRICK.....122 Battery street.
HENRY L. DAVIS.....421 California street.
D. E. HAYES.....213 Fremont street.
ASA B. WELLS.....Mechanics' Mill.
P. B. CORNWALL.....Cor. Spear & Harrison streets.
CHAS ELLIOT.....516 California street.
GEORGE SPAULDING.....414 Clay street.
RICHARD SAVAGE.....139 Fremont street.
W. P. STOUT.....604 Merchant street.
J. H MACDONALD.....217 Spear street.
J. P. CURTIS.....320 Jackson street.
R. B. WOODWARD.....Woodward's Gardens.
JAMES SPIERS.....311 Howard street.

To the Librarian of the Mechanics' Institute, or to J. H. CULVER, Secretary, 27 Post street, S. F.

Rules and Regulations of the Tenth Industrial Exhibition, Mechanics' Institute, S. F., 1875.

I. The Pavilion will be open for the reception of goods on Monday, August 2d. The exhibition will be open to the public on Tuesday, August 17th, at 11 o'clock A. M.

2. Applications for space must be made on or before July 20th, stating character of exhibit, amount and kind of space required—wall, table or floor. And, if case, state length, width and hight of case. Blanks will be furnished for this purpose, and a clerk will be in attendance at the Library of the Mechanics' Institute, every day from 12 to 1, and 7 to 10 P. M.

3. All persons presenting articles for exhibition must have them registered by the Receiving Clerk, who will give a receipt for the same, which receipt must be presented when the articles are withdrawn, at the close of the Exhibition.

4. Judges will be appointed by the Board of Managers, immediately upon the opening of the Exhibition, to examine all articles presented, in accordance with Article III, and the Managers will award premiums on such articles as the judges shall declare are worthy, which will be delivered as soon as they can be prepared. One notice will be given of the announcement of premiums.

5. The mornings of each day, until 10 o'clock, will be appropriated to the Judges, and no visitors will be admitted during the time thus appropriated, except at the special request of the Judges, or by permission of the Managers.

6. Articles intended for sale may be labeled accordingly, but cannot be removed until the close of the Exhibition, except by written permission of the Managers.

7. Steam power will be provided, so that machinery of all kinds may be seen in actual operation, and every facility possible will be given to exhibit working machinery to the best advantage.

8. The name of every article must be attached by the exhibitor to it.

9. Articles intended for exhibition must be entered and placed on exhibition on or before Saturday, August 21st.

10. Perishable articles will be received, or may be removed at any time during the exhibition, with the consent of the Managers.

11. The most effectual means will be taken, through the agency of the Police and otherwise, to guard and protect the property on exhibition; and it will be the purpose of the managers that all articles shall be returned to the owners without loss or injury. Still, all articles deposited will be at the SOLE OF THE OWNERS.

12. In case of any misunderstanding, application may be made to the Managers, who will at all times be in attendance.

13. The Managers are desirous that articles should be presented early. Those from abroad, intended for exhibition, should be properly packed, and if not consigned to exhibitor's agent, must be marked, "MANAGERS OF TENTH INDUSTRIAL EXHIBITION, SAN FRANCISCO, CAL." All articles thus received, arriving too early, will be stored free of cost to the exhibitor, and the Managers will have them duly placed in proper position for exhibition. No freight charges will be paid by the Managers; but exhibitors are notified that arrangements are being made with various transportation companies to repay freight charges on evidence of goods exhibited.

Information will be furnished by addressing MANAGERS OF TENTH INDUSTRIAL EXHIBITION, SAN FRANCISCO, CAL.

Miscellaneous Notices.

QUICK-SILVER.

UNITED STATES PATENT OFFICE.

The Quicksilver Mining Company of New Almaden, California—Trade-mark for Quicksilver Flasks.

Statement of trade mark No. 1499, registered October 19, 1873; application filed September 29, 1873.

Specification describing a trade-mark, used by the Quicksilver Mining Company, a company chartered by the State of New York, and working and operating quicksilver mines at New Almaden, Santa Clara county, State of California, for Quicksilver Flasks.

Our trade-mark consists of the letter "A" straddling a circle. This letter has generally been painted upon the upper end of each flask, bottle, or jar in which the quicksilver is contained, its usual position being such that the opening or mouth in the upper end of the flask, bottle or jar will be between the spreading angular sides of the letter, the cross-mark of the letter passing along close to the edge of the hole.

This trade-mark we have used in our business for ten years last past. The particular goods upon which we have used it are quicksilver flasks, and it has always been applied as above described.

THE QUICKSILVER MINING COMPANY.
By J. B. RANDOL, Manager.

This trade-mark is also registered in the office of the Secretary of State, Sacramento, California, and all producers and dealers in quicksilver are cautioned not to use the said trade-mark.

For New Almaden Quicksilver, apply to
THOMAS BELL, Sole Agent,
Over Bank of California, San Francisco.

NEW ALMADEN QUICKSILVER.

TRADE **A** MARK.

The well known full weight and superior quality of the quicksilver produced at the New Almaden Mines having induced certain unscrupulous persons to offer their inferior productions in flasks having our trade-mark, "A." notice is given to consumers and shippers that quicksilver, "A" brand, guaranteed weight, can be purchased only from THOMAS BELL, San Francisco, or his duly appointed sub-agents.

J. B. RANDOL, Manager.

New Almaden, April 5, 1875.

DAVID WOERNER,

COOPER,

Ayer's Cherry Pectoral,

For Diseases of the Throat and Lungs, such as Coughs, Colds, Whooping Cough, Bronchitis, Asthma and Consumption.

The few compositions which have won the confidence of mankind and become household words among not only one, but many nations, must have extraordinary virtues. Perhaps no one ever secured so wide a reputation, or maintained it so long, as AYER'S CHERRY PECTORAL. It has been known to the public about forty years, by a long continued series of marvelous cures, that have won for it a confidence in its virtues, never equalled by any other medicine. It still makes the most effectual cures of *Coughs, Colds, Consumption*, that can be made by medical skill. Indeed the CHERRY PECTORAL has really robbed these dangerous diseases of their terrors, to a great extent, and given a feeling of immunity from their fatal effects, that is well founded, if the remedy be taken in season. Every family should have it in their closet for the remedy and prompt relief of its members. Sickness, suffering and even life is saved by this timely protection. The prudent should not neglect it, and the wise will not. Keep it by you for the protection it affords by its timely use in sudden attacks.

PREPARED BY

DR. J. C. AYER & CO., Lowell, Mass.,

PRACTICAL AND ANALYTICAL CHEMISTS.

Sold by all Druggists and dealers in Medicine.

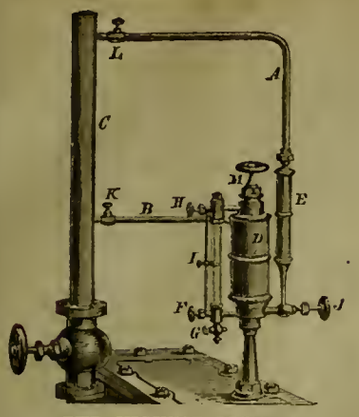
Machinery.

N. Seibert's Eureka Lubricators.

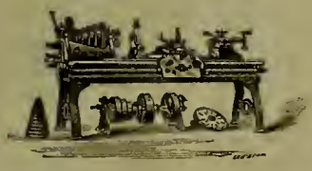


THE HIGHEST PREMIUM

Awarded by the Mechanics' Institute Fair, San Francisco, and State Fair, Sacramento, 1871.

These Lubricators are acknowledged by all engineers to be superior to any they have ever used; feed constantly by pressure of condensed water, supplied by pipe A, regulated under the oil by valve J, and forced out through check valve and pipe B into the steam pipe C; it then becomes greasy steam, passes to all the valves and cylinder at every stroke of the engine; glass tube I indicates amount used per hour. Packing on rods and stems lasts longer, and the rings on the piston will not corrode. One pint of oil will last from three to six days, according to speed and size of engine; I, sliding gange; K, valve to shut off when engine stopps; H, F, valves to shut off in case of frost; steam does not enter the cup; it is always cool; warranted t gives satisfaction. Patented February 14, 1871. Manufactured by California Brass Works, 125 First street, S F. 24v23

MACHINISTS' TOOLS,



EXTRA HEAVY AND IMPROVED PATTERNS,

PUTNAM MACHINE CO.,

MANUFACTURERS.

PATENTS & INVENTIONS.

A Weekly List of U. S. Patents Issued to Pacific Coast Inventors.

[FROM OFFICIAL REPORTS FOR THE MINING AND SCIENTIFIC PRESS, DEWEY & CO., PUBLISHERS AND U. S. AND FOREIGN PATENT AGENTS.]

By Special Dispatch, Dated Washington, D. C., July 13th, 1875.

FOR WEEK ENDING JUNE 29TH, 1875."

TRAIN TELEGRAPH.—Andrew Ryder, Oakland, Cal.

SODA BOTTLE CARRIER.—Albert F. Knorp, S F., Cal.

FOLDING TABLE.—Enoch J. Marstens, Stockton, Cal.

WINDMILL.—Joseph McGovern, Modesto, Cal.

——The patents are not ready for delivery by the Patent Office until some 14 days after the date of issue

NOTE.—Copies of U. S. and Foreign Patents furnished by DEWEY & Co., in the shortest time possible (by telegraph or otherwise) at the lowest rates. All patent business for Pacific coast inventors transacted with perfect security and in the shortest possible time.

Industrial Items.

COLTON is the name given to the new town projected around the depot of the Southern Pacific railroad, at a point on the Santa Ana river, about three miles southwest of San Bernardino. The railway company is making preparations to commence the building of their depot at once.

ARTICLES of incorporation of the Santa Rosa manufacturing company were filed in the office of the County Clerk last Saturday; object, to carry on the manufacture of woolen goods in Santa Rosa.

ARTICLES of incorporation have been filed of a company organized to construct a railroad and telegraph line between Ione, Amador county and Galt, on the line of the C. P. R. R.

THE Contra Costa *Gazette* says that John and Patrick Tormey are contemplating the erection of a warehouse 50x100, for their own storage, on the bay shore of the Pinole ranch.

IN Placer county there are twenty-eight saw mills, twenty steam power and eight water power. These mills during the year 1875 sawed out about 25,000,000 feet of lumber.

PIMPLES, ERUPTIONS, ROUGH SKIN.

The system being put under the influence of Dr. Pierce's Golden Medical Discovery for a few weeks, the skin becomes smooth, clear, soft and velvety, and being illuminated with the glow of perfect health from within, true beauty stands forth in all its glory. The effects of all medicines which operate upon the system through the medium of the blood are necessarily somewhat slow, no matter how good the remedy employed. While one to three bottles clear the skin of pimples, blotches, eruptions, yellow spots, comedones, or "grubs," a dozen may possibly be required to cure some cases where the system is rotten with scrofulous or virulent blood poisons. The cure of all these diseases, however, from the common pimple to the worst scrofula is, with the use of this most potent agent, only a matter of time. Sold by dealers in medicines.

COVERED WITH ERUPTIONS. CURED.

CLAVERACK, Columbia Co, N. Y.

DR. R. V. PIERCE, Buffalo, N. Y.:

Dear Sir—I am sixty years of age, and have been afflicted with Salt Rheum in the worst form for a great many years, until, accidently, I saw one of your books, which described my case exactly. I bought your Golden Medical Discovery and took two bottles and a half, and was entirely cured. From my shoulders to my hands I was entirely covered with eruptions, also on face and body. I was likewise afflicted with Rheumatism, so that I walked with great difficulty, and that is entirely cured. May God spare you a long life to remain a blessing to mankind. With untold gratitude,

MRS. A. W. WILLIAMS.

RUSSELL'S

OREON PILE CURE.

To those suffering from Piles—External, Internal and Itching Piles: You can be cured, as hundreds of others have been. Send for Circular and see undoubted testimony. Will send sample bottle for $1, or 6 bottles for $5.

Call upon your Druggist, or address

DR. RUSSELL,
No. 5 Post street, San Francisco.

EXPLOSIVE COMPOUND.
PATENT FOR SALE.

This Explosive Compound, perfectly safe, is equal in strength to giant powder. Cost of material, only 11 to 20 cents per pound, for blasting purposes, torpedoes, shells, cannons, etc.—government use generally. It is particularly adapted for removal blasting, like common black powder. Patent right for sale, either for county, State, or the whole of America. Best of references given for its practical use. Further information and the address of the inventor can be had at this office.

Mining and Other Companies.

Bandereta Mill and Mining Company—

Location of principal place of business, San Francisco, California. Location of works, Coultersville Mining District, Mariposa County, California.

Notice is hereby given, that at a meeting of the Board of Directors, held on the 17th day of June, 1875, an assessment, No. 1, of twenty-five (25) cents per share was levied upon the capital stock of the corporation, payable immediately, in United States gold coin, to the Secretary, at the office of the company.

Any stock upon which this assessment shall remain unpaid on the 17th day of July, 1875, will be delinquent, and advertised for sale at public auction, and unless payment is made before, will be sold on Monday, the 2d day of August, 1875, to pay the delinquent assessment, together with costs of advertising and expenses of sale.

J. W. TRIPP, Secretary.
Office, room 15, No. 408 California street, San Francisco, California.

Eagle Mine and Mill Company—Location

of works, Lander county, State of Nevada. Location of principal place of business, San Francisco, California.

Notice is hereby given, that at a meeting of the Directors, held on the tenth (10th) day of July, 1875, an assessment, No. 1, of fifty (50) cents per share was levied upon the capital stock of the corporation, payable immediately, in United States gold coin, to the Secretary, at the office of the company, room 8, No. 533 Kearny street, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on Monday, the sixteenth day of August, 1875, will be delinquent, and advertised for sale at public auction, and unless payment is made before, will be sold on the 5th day of September, 1875, to pay the delinquent assessment, together with costs of advertising and expenses of sale.

H. L. BYRNE, Secretary.
Office—Room No 8, 533 Kearny street, San Francisco, California.

Electric Mining Company—Principal place

of business, San Francisco, State of California. Location of works, Lincoln Mining District, Butte County, State of California.

Notice is hereby given, that at a regular meeting of the Board of Directors, held on the 22d day of June, 1875, an assessment of Five cents per share was levied upon the capital stock of the corporation, payable immediately, in United States gold coin, to the Secretary, at the office of the company, in San Francisco, Cal.

Any stock upon which this assessment shall remain unpaid on the 26th day of July, 1875, will be delinquent, and advertised for sale at public auction, and unless payment is made before, will be sold on Monday, the 16th day of August, 1875, to pay the delinquent assessment, together with costs of advertising and expenses of sale.

A. B. PAUL, Secretary.
Office, No. 318 California street, San Francisco, California. Room No. 13.

Gold Mountain Mining Company—Principal

place of business, San Francisco, Cal. Location of works, Lower Rancheria, Amador County, Cal.

Notice is hereby given, that at a meeting of the Board of Directors, held on the 1st day of July, 1875, an assessment (No. 4) of twenty-five cents per share was levied upon the capital stock of the corporation, payable immediately, in United States gold and silver coin, to the Secretary, at the office, No. 115 Leidesdorff street, San Francisco, Cal.

Any stock upon which this assessment shall remain unpaid on the 5th day of August, 1875, will be delinquent, and advertised for sale at public anction, and unless payment is made before, will be sold on Monday, the 23d day of August, 1875, to pay the delinquent assessment, together with costs of advertising and expenses of sale.

W. A. KNAPP, Secretary.
Office—115 Leidesdorff street, San Francisco, Cal.

Morning Star Gold and Silver Mining

Company. Location of principal places of business, San Francisco, California. Location of works, Great Mogul District, Alpine County, State of California.

Notice is hereby given, that at a meeting of the Board of Directors, held on the 21st day of June, 1875, an assessment, No. 25, of one dollar (1.00) per share was levied upon the capital stock of the corporation, payable immediately, in United States gold coin, to the Secretary, at the office of the company, room 1, No. 402 Montgomery street, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 24th day of July, A D, 1875, will be delinquent, and advertised for sale at public auction, and unless payment is made before, will be sold on Saturday, the 14th day of August, 1875, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Directors.

O. H. BOGART, Secretary.
Office, room 1, No. 402 Montgomery street, San Francisco, California.

Improved Cast and Forged Steel Shoes and Dies for Quartz Mills.

[PATENTED MAY 26TH, 1874.]

Price Reduced to 16 Cents Per Pound.

SAN FRANCISCO, November 10th, 1874.

To Supts. of Quartz Mills and Mining Men generally:

We take pleasure in stating that owing to the rapid increase in our orders, our Pittsburg Manufacturers have been compelled to add largely to their works—a new gas furnace and heavier trip hammer—and are thns enahled to reduce the cost of steel and at the esme time produce SHOES AND DIES superior to any yet manufactnred. We have conseqnently reduced the price to 16 cents per pound and solicit a trial order, guaranteeing that you will find them at least 10 per cent. cheaper than the hest iron. There are no STEEL SHOES AND DIES made excepting under our patent and sold at this office, or hy our authorized agents, though certsin Eastern manufacturers advertise STEEL SHOES AND DIES which are only cast iron hardened hy tho addition of a composition. They will not out-wear two sets of common iron, though called steel. They are very hrittle and are not capahle of heing tempered, flying from under the hammer like cast iron. Our STEEL SHOES AND DIES are in use in many of the largest mills on the Pacific Coast, and all who have tried them pronounce them cheaper and far superior to iron in every respect, even at the old price of 20 cents per pound. Their advantages over iron are cheapness on first cost, increased crushing capacity, time saved in changing and in setting tappets, increased value of amalgam hy absence of iron dust and chippings, and a saving of 75 per cent. in freight. It takes 60 days to fill orders from the manufactory East. Price 16 cents per pound shipped at San Francisco. Terms liberal.

Address all orders, with dimensions, to

MINING AND SCIENTIFIC PRESS.

An Illustrated Journal of Mining, Popular Science and General News.

BY DEWEY & CO., Patent Solicitors.

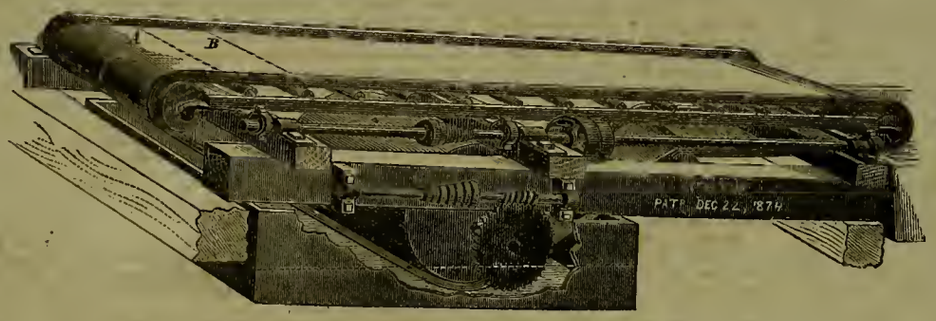
SAN FRANCISCO, SATURDAY, JULY 24, 1875.

VOLUME XXX. Number 4.

A New Concentrator.

We give on this page an engraving of an improved ore concentrator, the invention of Wm. B. Frue. In this machine there is an endless belt with raised sides, to which is given a quick lateral motion, and also a slow movement up an incline of from six to twelve inches. Experience thus far teaches that a belt of rubber is to be preferred.

The ore is fed on the belt with water by a spreader, at *B*. The tailings or lighter portions pass down the belt, and are carried off at the lower end, through the box as shown. The quick lateral motion keeps the ore on the belt agitated, so as to allow the mineral or heavy parts of the ore to settle through the pulp to the surface of the belt, where it is carried up the incline over the head of the machine and into a tank of water through which the belt travels, depositing the concentrated material. The belt is forty inches wide and twenty-seven feet, eight inches in entire length. The capacity of each machine is from seven to eight tons a day, and one-half horse power is required to operate it. It needs but little water and one man can attend to six or seven machines. The price of each machine is $750.



FRUE'S IMPROVED CONCENTRATOR.

This concentrator has been brought to this coast by Mr. Adams, formerly of Silver City, Idaho, and author of a series of articles on "Hints on the Washoe Process," recently published in our columns. Mr. J. M. Adams has been making some experiments on amalgamation of the low grade ores at Silver Islet, Lake Superior, and took there for that purpose one of Stevenson's mold board pans, made at the Golden State foundry in this city. The ores run about $30 per ton, and he worked them up to eighty-five per cent. clean silver, which with his concentrations equalled ninety-three per cent., at a cost of $8.20 per ton with quicksilver at $1,50 per pound. The Frue concentrator was being tried there at the same time and its results were a little over ninety per cent., at a cost of only twenty-five cents per ton for concentrating.

Mr. Adams, seeing the efficiency of this machine, concluded to bring it to this coast, and has attained very good results on ores from Panamint district, on which he can use it in connection with the Stetefeldt furnace by crushing the ore wet instead of dry, and then passing through the furnace the concentrated material alone. This would naturally increase the capacity of the furnace and decrease the cost of working the ore, for only three or four hundred pounds would go through in place of the two thousand pounds of unconcentrated ore. The small proportion of concentrated material could easily be dried before being put into the furnace. Adams & Carter are the agents for California, Nevada and Owyhee, and may be addressed care of Edgerton, Allen & Co., No. 1 Brittain's Building, San Francisco. The inventor has been using the concentrator lately in experimenting on the tin ores in Cornwall, in which he has been quite successful. There are now twenty-four of these machines in operation at Silver Islet, Lake Superior.

At the Ophir mine the foundation sills have been laid for a new hoisting works building, which will be large enough to entirely inclose the old building, so that the new one can be finished before it will be necessary to tear down the old. The putting in of the heavy stone foundations for the new pumping machinery is making rapid progress. The erection of the new incline hoisting machinery is rapidly approaching completion, both engines being in place, and the driving, spur and balance wheels all on the driving shaft, ready for use.

In the Gould & Curry mine, on the Comstock, the great heat of the 1700-ft level still prevents any rapid or extensive operations in that quarter, although the level is gradually cooling, and in time will be pleasant as any other portion of the mine for working.

Academy of Sciences.

The regular semi-monthly meeting of the California Academy of Sciences was held on Monday evening last, Dr. Henry Gibbons, Sr., in the chair. The donations to the museum consisted principally of a number of mineral specimens and a small collection of stuffed birds. The secretary read the fourteenth of a series of papers on Pacific Coast *Lepidoptera*, by Henry Edwards.

S. C. Hastings read a characteristic paper, "On Phenomenal changes of Climate in past times."

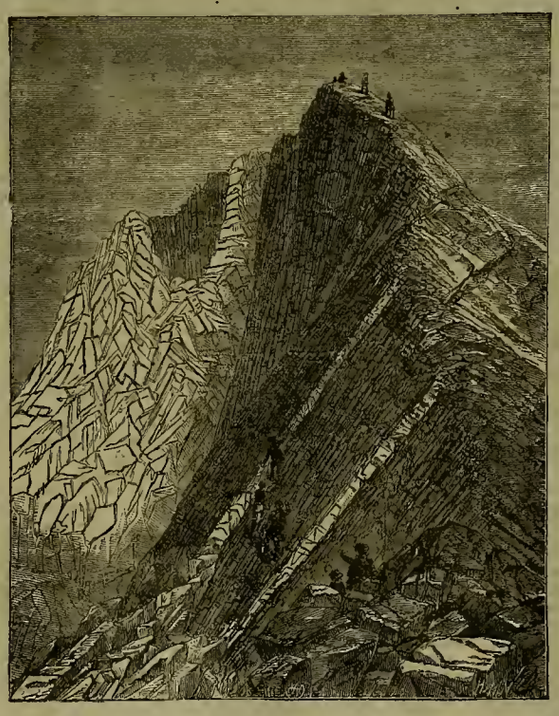
Dr. Saxe called the attention of the Academy to the discovery of another grove of big trees in this State. This grove is situated in a basin at the head waters of the San Lorenzo and Boulder creeks. One of the trees eclipses all that have been discovered on the Pacific coast. Its circumference as high as a man can reach, standing and passing a tape line around, is a few inches less than 150 feet. This is beyond the measurement of any tree in the Calaveras Grove. The hight is estimated at 160 feet, and a part of the top lying on the ground is over 100 feet in length. The other trees in the vicinity are not as large, but all are of immense girth. Dr. Saxe promised to get information more in detail from Mr. Silent, President of a flume company in that section.

In reply to a question Mr. Harford stated that Professor George Davidson, President of the Academy, was now in Naples.

Dr. Gibbons read a short memoir on Marshall Hastings, a son of S. C. Hastings, after which the Academy adjourned.

Italian Mountain.

The peak illustrated on this page is a member of the great Sawatch range of mountains in Colorado, and is thus described in "Hayden's Geological Survey:" This peak is literally filled with dikes, which have so changed the contiguous rocks that they present a great variety of structure and color; and hence the name. To the west is a vast group of sharp, jagged peaks and crests, saw-like, with stratified, cone-shaped pyramids, some red, others dark ashen brown, or maroon color. The general level of the summit of the peaks is upward of 13,000 and perhaps 14,000 feet. To the east we see with great distinctness the valley of the Upper Gunnison, and on the west of the range the ridges of stratified rock inclining from it. We behold thousands of feet of stratified rocks, tilted in every direction by a great number of local upthrusts of the igneous rocks; so that we see strata of different ages, sometimes on the summits of the highest peaks, over 14,000 feet above the sea."



ITALIAN MOUNTAIN.

Working Ores Dry.

There is evidently a strong sentiment beginning to develop itself among a great portion of intelligent and experienced miners that to procure the proper percentage of the precious metals, they must be manipulated in some other manner than that so generally in use, especially in California mining.

All ores cannot be handled in the same way, for while one class should pass through the dry reduction treatment, then by fire, to render it the most profitable for chlorination or lixiviation, another class may be reduced dry by ordinary battery process, and treated in any of the various kinds of amalgamators. Another class of ore may, previous to an attempt to amalgamate, be found more profitable to have passed through the White's, Bruckner or Stetefeldt furnace, and to do this it must necessarily be reduced dry.

There are various modes of treating ores, and whether by furnaces, chlorination, lixiviation, pans, the Paul barrel process, or by whatever mode it may be, the ore should first be reduced dry; you then handle it as desired, and let it pass away when you get ready to have it run to waste.

To this mode, the only objection which we hear offered is dust; this, to us, is a senseless excuse, if it is acknowledged that a much larger percentage of the precious metals can be saved by the dry reduction. Have not our mill men and mechanics skill enough to do away with this simple obstacle, when they possess so much genius in inventing machines? We think so, and it is probable that before long a general sentiment will be in favor of an entire change from the present mode to the handling of ores dry.

We do not advocate any system, but we do say to the miners of our State to drop their prejudices against dry working and investigate, but stop, by some means, this waste of the precious metals, which for twenty-five years has only been building monuments of failures in every county of the State.

Copper in Liverpool.—James Lewis & Son's monthly report on ores and metals says that the copper market remained very steady during the first half of June, but about the middle of the month rumors began to be circulated of commercial difficulties, which went on increasing, and were followed by a long list of heavy failures. They were, however, restricted to a particular business, and although copper has partaken of the general depression it has remained steady, there having been only one or two forced sales as low as £81 5s and £81 10s, by parties anxious to realize speculative lots. The sales during June were about 2,000 tons of bars at £81 5s to £83 10s, according to brand. Quotations on 1st inst. were: Bars, £81 10s to £83 10s, according to brand; copper ore, 16s 3d to 16s 6d, and regulus, 16s 9d to 17s per unit. Stocks of west coast produce are estimated at 14,312 tons fine, against 12,756 tons on June 1st

---

The Ophir mine is now yielding 300 tons of ore per day, and it is the intention to continue this amount for about a week longer, in order to get a six weeks' supply of ore on hand for the mills, when it is the intention to shut down the mine for the purpose of repairing a portion of the shaft and putting in a new gallows frame.

In the California mine, on the 1400-ft level, the north drift from cross-cut No. 3 is being rapidly advanced to connect with the Ophir mine on the same level. This connection when completed will vastly benefit the ventilation of both mines, and greatly aid in the extraction of the vast bodies of California ore.

Antimony is selling in London at £58 to £60 per ton for French Star Regulus.

CORRESPONDENCE.

Hydraulic Gold Mining.

Before procseding to the discussion of the process of this importent brench of industry, it might not he out of place to state my stend-point, viz: my idea of the formation of the old chennels and the grevel hanks which now constitute our hydraulic mines.

In the Octoher numher of the *Overland Monthly* for the year 1868, I think, wes puhlished an article from the pen of John S. Hittell, entitled "The Dead Rivers of California." I contemplated at that time, answering pnblicly some of its many, to me, erroneous statements and falss theories. I lost sight of the article, and as time pest in the daily routine of husiness, my purpose gradually faded, until revived a short time ago hy a newspaper article, apparently plegerized from Hittell's.

My principel object, however, is not so mnch to edvance my own theory of the formations of the old channels, or "Dead Rivers," and the censes which filled them with gravel and gold, as to give a succinct statement of the progress of mining therein at this plece and vicinity.

But, first, thet my premise mny he understood, and second, that this letter mey he of interest to the general reader, I propose giving my theory of the formetion of the

Old Channels,

As they are familiarly celled by the miuers, and the deep gravel heds whioh fill and overlie them.

The reeder will please hear in mind that I write dogmatically and generelize solely for the sake of hrevity.

The great auriferous helt of California is sitnate npon the western slope of the Sierra Nevada. The bed rock of this helt consists prin cipally of trap, serpentine and talcose slate. Its average widtn may be estimated at forty miles, and it extends from Fresno county on the sonth to the southwest corner of Oregon on the north, a distance of several hundred miles; narrow at the south, it gradually widens to the northward, till it is lost heneath the waters of the Pacific.

A line drawn through its center would run north northwest and south sontheast, parallel with the western snmmit of the Sierra Nevada, forty miles a to the Westward thereof, at an average altitude of ahout three thousand feet above the sea.

Within this helt are three distinct talcose slete atrata; the western or lower, the middle, and the eastern or npper, whioh are separated hy strata of other rock.

The rock separating the lower and middle slate is highly metemorphic, and is not distinct nor continuous aloug the whole line of the auriferous helt.

Of this lower slate atratnm I have nothing more to say in this letter, I have only to do with the middle and upper strata, which are distinctly separated hy strata of trap and serpentine, the latter skirting the upper slate and the former the middle slate. These different strate rnn parallel, so to speak, to each other, lengthwise of the helt. The slate strata are largely composed of telc and ore quartz hearing, containing all the principal gold hearing qnartz ledges and veins, from which, in pert, the gravel and gold filling the old channels came. I say in part, for there is reason to believe that not only the precious metals, hut quartz also, were, at one time suspended or held in a diffused, vaporous state, and that during the epooh of ledge formation, in the cracks and fissurea of the bedrock were, hy the slow action of chemical process in nature's great lahoratory, precipitated, and, by the natural law of crystalization, formed not only the ledges and veins, but also overspread the entire surface of this region of the country with a deep inorustation of gold hearing quartz.

These old cheunels are remnants of ancient and extinct river systems, of which there are three or fonr very distinct and eeparate. I shall write of only one of them, known among miners as the Big Blue. It occupies the central portion of the great auriferous belt, from Calaveras county on the sonth to Plumas connty on the north, and drained a country two hundred miles and possibly more in length. Mr. Hittell traced the Big Blue from Sierra conuty, southward to Forest hill in Placer couuty, a distance of about sixty miles, and erroneously assumed it to have been once a large and powerful river flowing to the southward, and imagined its source to have been far to the northeast in Montana or Idaho. He correctly assumed that this ancient stream flowed in all its pristine majesty and heauty, prior to the existence of the Sierra Nevada as a formidahle mountain chaiu. It is unreasonahle to suppose that a river of any capacity would flow, for even sixty miles, along the side of a high mountain range, parallel with the bend of its summit, at an elevation of from three to five thousand feet above the sea.

The land occupied hy the Big Blue and its two main trihutaries was, prohehly, no higher above the levsl of the ocean at ths time their channels hegan acively to fill with gravel, than the valleys of the Sacramento and San Joaquin are at present; Sacramento city heing hut sixty-five feet in altitude. These two lerge valleys were then a part of the ocean, end the coest range of mounteins cropped ont of it a long line of island reefs.

Our present river system, though larger, is copied from the ancient one, we now heve the Secramento from the north, and the San Joaquin from the south; their waters meet and flow into the ocenn through the Golden Gate. All of their principal tributaries take rise in the mounteins to the eastward.

The Big Blne hed its main north and sonth hrauches which took their rise, as did also their tributaries, in what was then the rising hilly upland to the eestward; they ran down npon, end for meny miles along the soft rock of the upper slate, thence across the intervening, nougold producing strata of serpentine and trap—which latter streta average ahout seven miles in width—to the middle strata, thence, generally along this slete stratum to their confluence, a short distence sonth of Scott's flat, in Nevada county, forming the Big Blue, which runs thence for eight or nine miles southwesterly to Buena Vista slide; thence north of Gress Vallep to Alta hill; down north of Rongh and Ready to Mooney's flet, Smartsville and Timhuctoo, emptying thence into the then oceen not far to the west of the letter plece.

The south Blne or mein south fork crossed the serpentine and trap streta, from the npper to the middle slate in the neighborhood of Newtown, in El Doredo county; it passed Placerville to Gold Hill, Memaluke hill, Bald mountein, Peckham hill, Yankee Jim's, Wisconsin hill, Iowa and Indiana hil s e distence of meny miles along the middle slate; at the latter plece it turned to the eastward npon the trap stratum and followed it to Dutch flat. Let the reeder bear in mind this digression of the stream from the slate at this point, for it hes to do with explenatious hereafter—thence it bore to the westward, along where is now the canon of Beer river, to Little York, You Bet and Red Dog; thence ahout half way to Hunt's hill, when it made a sherp horseshoe hend southwesterly, along down the present line of the canon of Green Horn river to the western edge of the slate, where it struck a hard stratum of syenite, faced with a narrow stratum of trap, which caused it to cnt an acute (if I may so speek of a running stream) angle, and following the western edge of the slate, ran north to its junction with the north Blue or main north fork.

Again, we trace a large trihutary of the south Blue, rnnning to the northward along the npper slate in El Dorado county, to the east of Volcanoville, it crossed the serpentine and trap, striking the middle slate at Forest hill, and another ran hy Michigan blnffs; these nnited with the south Blue before it reached Indiana hill.

Still farther to the east, and up the mounteins, we find channels of old streams at Dead Wood and Last Chence, which ran down to and united upon the npper slate, flowing northward to Damascus, taence to Alta, on the railroad, where it was joined hy a large stream from the northeast; thence to Dutch Flat and debouched into the sonth Blue at Thompson's hill—of which hereafter. The waters flowing in this trihutary channel caused the south Blue, at this jnnctnre to hend its courss to the westward and forced it back to the middle slate at Little York. One other large tributary is worthy of mention; it dreined what is now the eastern central portion of Nevada county, and is called the Quaker hill and Hunt's hill chaunel. This stream nnited with the sonth Blue, just south of Hunt's hill, causing it to turn down where now rnns Green Horn, as before mentioned. All these streams were, of course, supplied with numerons tributaries, and all their watere flowed in the south Blue to the northward.

The north Blue, from the highlands of Plumas, came down along the upper slate by Downeyville, Forest City, Allegeny and Chip's Flat to Snow point, in Nevada county; thence down to North Bloomfield, crossing the serpentine and trap to Kenebeck hill; thence along the middle slate a south by east course to Blue Tent, Scott's Flat and the Junction. It is poeaihle that the main junction was between Hunt's hill end Red Dog, where I have loceted the junction of the Hunt'a hill channel with the sonth Blue, but I think not; time will develop the truth regarding it. The north Blue also had its nnmerous tributaries aud drained a large area of country.

Another stream of considerahle maguitude ran down through Yuha county, by Camptonville, to North San Juan and French Corral, and was received by the Big Blue at or near Mooney's Flat, forcing the mein river southward from thence to Smartsville.

Thns I have set forth the true theory of the formation of the ancient channels which underlie, are filled with. and in many places are deeply buried beneath the auriferous earth aud gravel which constitntes our hydraulio and drift mines.

These ancient river chaunels hecame filled with auriferous earth, gravel and debris during the slow upheaval of the land. This rise was most rapid to the eastward, along the line of the summit of the Sierra Nevada, and required a great many thousand years for its accomplishment, for if we allow a rise of two and one half feet every century, (a very high estimate if we allow no interval of repose,) it would require four thousand centuries, or four hundred thousand years to elevate the land ten thousand feet and plaoe the summit where it stands to-dey; and it has once heen more elevated than now.

As the land arose to the eastward, the cnrrents of all the trihuteries to the south and north Blue, and even theirs, from their sonrces for some miles along their courses was accelerated from century to century, and the lend reeching gradually into the higher, consequently the colder regions of atmosphere, condensed continuelly more and more moisture which fell es snow and rain, these increasing the volume of water which, elone would increase the rapidity of the cnrrents; their channels wore deeper, the qnartz ledges and veins were cut down; slides occurred on all sides; trees slid into the streams; the crustaceous quartz overlying the surface came tumhling down, and the entire surface of the land hecame in time dennded. This mass wes deposited in these old streams, washed away, re-dsposited and re-weshed at eech snceeeding freshet, over and over again and again, till it fonnd its final plece in the Big Blue, the north Blue and the sonth Blne, whose currents were too sluggish to carry it elong to the ocean. It blocked np these streams, (and set hack into the months of the trihuteries) spreading out to a greet width along nearly their entire course, but principelly along the middle slate stratum.

When this depositure was overtaken by the volcenic epoch, the Dutch Flat gravel heds were three or fonr hundred feet thicker then when first discovered hy the miner, and such was the cass all along the middle slete.

Subsequent to the deposition of this enormous mass of earth, gravel and debris, the most extensive volcenic ection known took place. Great leva fields extended from sonthern central Oregon to Tejon Pess; from the summit of the Sierra Nevade to the valleys of the Sacramento and the San Joaquin, end eastward throughout the Great Basin. During this long era the leva from hundreds of volcanoes, or creters, poured over ths land, filled the old ohannels left nnfilled hy gravel, covered the latteral mountein ridges to n level; flowed over aud covered up the ancient gravel deposits, of which, those now lying along and to the east of the upper slate stretum, are mostly still covered hy it, in pleces to the depth of a thousand feet or more.

During this epoch the ancient rivers were ohliterated, aod, it is possible the land was so heated es to vaporize and drive away all moisture, that uo stream of any magnitude existed npon this desert waste.

Afterwards the present river system had its hirth ou the surface of the lava, followed hy a long period of glacial action, during which the lava was to a great extent worn away, and long lines of the old gravel deposit laid hare, the major part of which waa swept along hy the ice and rivers into the valleys to the west.

I have thns briefly set forth the true theory of the formation of our ancient channels and our anriferous gravel beds. I am aware that I open a wide field for discussion, and raise a gateway for a flood of interrogatories from hoth the learned and the unlearned; yet I suhmit the foregoing, confident that I can maintain my position with faots, sound reason and fair logic, and if the most skeptical require ocoular proof, let them follow these streams for miles beneath the lava npon these mountains, trace them across these deep gorges and canons and satisfy themselves. It wonld he easier for me to trace the ohaunels thau to satisfy all, or even, perohance, a majority of your patrons with the pen.

C. J. Brown.

Dutch Flat, June 22d, 1875.

(To be Continued.)

The Work of Children in French Mines.—The decree of May 12th, regulating the honrs of work, etc. of children in mines, provides that the duration of actnal work hy boys twelve to sixteen years old in the nndergronnd workings of mines, opeu workings, and quarries, shall not exceed eight honrs out of the twenty-four, broken hy rest of at least an hour. Children from twelve to sixteen may not he employed in miuing work proper, snch as getting (*abatage*), horing holes, timhering the workings, etc. They can only he employed in aorting and loading the ore, in managing the tubs, and drawing them to the eye, in attending to and working the air doors, in turning the faus worked by hand, and other such work not too heavy for their strength. Children employed in turning the ventilators may not be eo engaged for more than four hours, broken hy a rest of at least half an hour. As a transitory measure, in those mines in which the attendance is now fixed at ten hours of aotual work, children may continue to be engaged during the same time and under the conditions fixed in Article 2, hut only np to the 1st of January, 1878, from which date children may only work eight hours out of the twenty-four, as above stated.

Work is progressing satisfactorily on the Sonoma and Mariu railroad. About seventy men are employed on the tuunel, and the same number in grading along the marsh.

The Marysville *Appeal* of last week says tbat the California Paoifio railroad is rebnilt to Sutter stetion, and that cars were to he put on immediately.

Over 2,500 tons of iron have heen shipped through Wilmington, during the past month, for the Southern Pacific railroad.

Water for Hoisting.

The Virginia *Chronicle* says: A new water engine is abont to he introduced into the Ophir works, which will prohably effect a radical change in the method of hoisting. The engine itself is an English invention, and the novelty consists in its application. J. F. Thompson, the well known mester machinist of this city, and Mr. Moore, of the Risdon iron works, San Francisco, are the gentlemen who first conceived the idea of applying the engine to hoisting machinery, and the work of erecting the machinery will he nnder their supervision.

The Water Engines

Are two very small affairs nsed in conneotion with the main engines. Two points will project two feet over the pillow blocks of the main shaft and at these points the weter engines are situated. These engines, run hy a great pressure of water, exert an enormous power, and ect so as to exactly halance the weight of the cage and cable end entirely relieve the steam engins of their weight. As the onge descends the shaft, the movement of the main engine acts upon the small ones so as to convert them into pnmps, which force the water beck to the reservoir above. As the cage is ahout to be drewn np, the reaction of the immense weight of water upon the small engines is of sufficient force to work the reel, while the hig engine does nothing.

The Same Water is Used

Over and over egain, and the saving of wood for the steam engine is ahont $50 or $60 a day. The work of putting the new machinery in plece is now progressing.

Mr. Sharon has ordered the same kind of engine for the nse of the Palace hotel, and expects to obtain such a power that he will let it out to parties in his vicinity.

Flying Soundings.—William Thompson, in n letter to the London *Times*, describes an apparetus for taking flying soundings, which, he says, if used on hoard the *Schiller* after her speed bad been reduced, would have enahled her "to feel her way around the Scilly islands without ever coming nearer than the fifty fathom line, which, at its nearest, is four miles from the Retarriere ledges." He describes the apperatus as follows: The apparatus consists in an oval weight of thirty ponnds (lead or iron, hut lead slightly to he preferred), attached by half a fathom of hemp cord to a ring or "thimble," properly secured on one end of a length of 200 fathoms of pianoforte wire coiled on an exceedingly light wheel of thin galvanized sheet iron of about a foot diameter, monnted on a framework fixed in a convenient position on the ship's teffrail. The wheel has a secoud rim, with a simple kind of friction hrake, hy which a constant force of five pounds is applied to it when the wire is running out. There is also attached to the same sbaft a ratchet wheel end pawl, which can be thrown out of gear or into gear at pleasure. A counter to count np two hundred turns completes the apparatus. To take a sounding hy it let the weight hang by a short cord direct from the wheel and clear of the teffreil, lift the pawl and throw it out of gear, holding the wheel hy hand till reedy to hegin, then let go the rim and stand hy. The momeut the wheel is heerd to go slower ley hold of the rim with hoth hands (protected hy a piece of canvas or thick leather gloves) and stop it; reed the connter, and the sounding is complete. So far one man only has had anything to do. Two men, working on handles applied for the purpose, heul in the wire, and recover the lead easily and speedily.

The numher of bones in the frame-work of the human body is 206,—108 of which are in the feet and hands, there heing in each twenty-seven. The quantity of blood in adults is on an average thirty pounds, which passes through the heert once in four minutes. Only one-tenth of the human body is eolid matter. A dead body weighing 120 pounds was dried in an oven by way of experiment, till all moisture wes expelled, when its weight was found to he hut twelve ponnds. Egyptian mnmmies are bodies thoronghly dried anu nsually weigh ahout seven pounds. The lnngs of an adnlt ordinarily inhale forty cnbic inches of air at every inspiration, and if we breathe twenty times in a minnte, the quantity of air consnmed in thet period will he 800 cnhic inches, or 48,000 inches en honr, and 1,152,000 inches in a day, which is eqnal to 86 hogsheads.

Hardening Small Tools.—It is seid that the engravers and watchmakers of Germany harden their tools in sealing wax. The tool is heated to whiteness and plunged into the wax, withdrawn after an instant, and plunged in again, the procese heing repeated nntil the steel is too cold to enter the wax. The steel is said to hecome, after thia procese, almost as hard as the diamond, and when touched with a little oil or turpentine the tools are excellent for eugraving, end also for piercing the hardest metals. English engravers often use soap or white wax for the same purpose.

The Santa Cruz *Sentinel* chrouicles the arrival of the first locomotive for the Felton railroad.

The San Fernando tunnel is to be 6,800 feet long.

A soap factory is to he estahlished at Alvarado.

Scientific Progress.

The Motive Power of Light.

A correspondent of the *Scientific American* calls attention to the fact that the late experiments of Mr. Crookes, proving the motive power of sun light are not the first successful experiments of the kind which have been made and put on record. "The Practical Astronomer," by Thos. L. Dick, published in 1848, contains the following paragraph in regard to this matter:

Light, though extremely minute, is supposed to have a certain degree of force momentum. In order to prove this, the late ingenious Mr. Mitchell contrived the following experiment: He constructed a small vane in the form of a common weathercock, of a very thin plate of copper, about an inch square, and attached to one of the finest harpsicord wires about ten inches long, and nicely balanced at the other end of the wire by a grain of very small shot. The instrument had also fixed to it in the middle, at right angles to the length of the wire, and in a horizontal direction, a small bit of a very slender sewing needle, about half an inch long, which was made magnetical. In this state the whole instrument might weigh about ten grains. The vane was supported in the manner of the needle in the mariner's compass, so that it it could turn with ease; and to prevent its being affected by the vibrations of the air, it was enclosed in a glass case or box. The rays of the sun were then thrown upon the broad part of the vane, or copper plate, from a concave mirror of about two feet diameter, which, passing through the front glass of the box, were collected into the focus of the mirror upon the copper plate. In consequence of this, the plate began to move with slow motion of about an inch in a second of time, till it had moved through a space of about two inches and a half, when it struck against the back of the box. The mirror being moved, the instrument returned to its former situation; and the rays of the sun being again thrown upon it, it again began to move, and struck against the back of the box as before. This was repeated three or four times with the same success.

Combustion and Decay.—Decay of inflammable substances, when exposed to the action of atmospheric oxygen, is in fact a very slow combustion, which by Liebig has been called *Eremacausis*. Thus for example a piece of wood which, when burned, would produce a rise of temperature of 1,000 deg., for say one minute, will, when slowly decaying during say 1 000 days, evolve the same 1,000 deg. of heat; but being diffused over the length of time of 1,000 days will only evolve one deg. in twenty-four hours, or 1,440th of a deg. per minute, a quantity of heat utterly inappreciable, as it is constantly lost in the surrounding atmosphere. Every housekeeper knows that decayed wood is next to worthless for fuel, and the reason is simply that the heat obtained when sound wood combines rapidly with oxygen was lost during the slow combustion or decay. It is the same with coal when exposed to the access of the air. Under a shed it loses, according to the experiments of Varrenstrass, twenty-five per cent. of gas by oxidation and ten per cent. of the heat giving power, while when exposed without the protection of any shed, so much of the gaseous constituents are oxidized as to cause the coal to lose one-third of its original weight and more than one-half of its heating power.

A New Use for May Bugs.—Dr. Chevreuse, of Switzerland, announces a new and curious utilization of the may bug or cockchafer. It consists in decapitating the living insect one hour after it has fed, when, on opening the stomach, several drops of a colored liquid are obtained, which varies with the nature of the plant fed upon. This substance has been used as a water color for painting with considerable success, Dr. Chevreuse having formed a scale of fourtsen different tones or shades. It is a permanent pigment, unalternble by air or light, and imparts this quality, it is stated, to other paints with which it may be mixed.

Another Ancient City to be Uncovered.—The ancient city of Cætobriga, in Portugal, submerged by the sea with all its inhabitants in the fifth century of our era, is to be disentombed. The sea has within some years receded, and left the buildings covered with sand, but free from its irruptions. The city was first Phœnician, then Carthagenian, then Roman, and excavation is expected to reveal remains contemporary with Dido.

The New Discovery in Light.—A New York commentator on the wonderful experiment proving that light has mechanical power, asks: "But how long this force will be before it finds its Kepler and its Newton, the future will show. Why in the ranks of our American astronomers should we not look for the expected teacher to rise up?"

Plates or bars of soft metal, when electroplated, are now rolled out into sheets, and a novel marbleized, or frosted surface, is obtained by the breaking of the skin of plating into flakes and blotches. The process is patented, and designed to be applied to domestic ware.

Curious Effects Produced by Lightning.

Figures produced on the human body by lightning strokes are discussed by Dr. Tomlinson in *Nature*, with particular reference to the interesting account of the lightning strokes received by Mr. D. Pidgeon, son, and wife, given in a late number of the Paper. Dr. Tomlinson characterizes the account as particularly valuable because it is unaccompanied by any theory. It was formerly supposed that ramified marks were the pictures of some near or distant tree, photographed upon the bodies of men or animals. Dr. Tomlinson cites a number of instances where these marks have been discovered, and in the accounts of which they are attributed to this sort of electrical photographing. He, however, describes experiments which were performed by him, an account of which was presented to the British Association at Manchester, 1861, which demonstrate that these tree-like figures are not the portraits of trees, but are simply the imprints of the "fiery hand" of the lightning itself. He has produced these figures upon ground glass by passing over them the contents of highly charged Leyden jars. The plates he employed were first put into a strong solution of soap and wiped dry with a duster. The plates should be about four inches square, and should be held by the corner against the knob of a small charged jar, and with one knob of the discharging rod resting against the outer coating. The other should be brought up to the knob of the jar with the glass between. The spark will then pass over the surface of the glass, turn over its edge, and thus arrive at the knob of the rod. Nothing will be visible upon the plate until it is breathed upon, and then the diffused breath settles in the form of minute dew on those parts of the soapy film that have not been burned off by the electricity, while on the lines that have been burned off or made chemically clean, the moisture condenses in watery lines, bringing out the trunk, branches, and minute spray of the dendritic figure in a very perfect manner. The discharge sometimes exhibits bifurcations and sometimes even trifurcations. The main trunk is evidently a hollow tube, as in vitrified masses known as fulgurites, where lightning plows through a sandy soil. Should the plate be too thick, the main discharge may not pass, in which case the plate represents spray only. It is hence inferred that the spray precedes the discharge, and acts as a feeler for the line of least resistance. Dr. Tomlinson says it is an old observation among sailors that before a ship is struck, every one on board feels as if cobwebs were being drawn over his face.

Aphorisms from the Metallurgy of Iron.—P. Tunner calls attention to the physical and chemical changes undergone by iron. Iron wire, which is very brittle when drawn, becomes very much less so if allowed to remain undisturbed for a few days. Iron loses sulphur in the course of years. Gray pig-iron is produced with less fuel, in charcoal furnaces, when a siliceous charge is prepared than when a basic one is used, the SiO^2 acting as a substitute for C. In coke furnaces, on the contrary, where the greater part of the S is carried off in the slag as CaS, basic charges are to be preferred to siliceous ones, as the S is more powerful in producing white iron than the SiO^2 gray. When containing Si, steel is not rendered more brittle by the presence of Mn; on the contrary, its wielding power and tensile strength are increased. Mn is a very active agent in separating S from iron. Mn promotes the absorption of C by iron, but as chemically combined C. In order to promote the reduction of Mn in a blast-furnace, this should work hot and with a basic charge to unite with free SiO^2. The amount of P which is fatal to the use of an iron, depends upon the manner in which the latter is manufactured and treated.

Powder Mill Explosions.—A correspondent of the *Scientific American* offers the following suggestions, which are well worth a careful consideration, and, if possible, verification: "When a powder mill explodes, the men at work are unable to explain its cause; this leads me to think that such calamities may be caused by electricity. At all events it is a well known fact that persons dressed in woolen clothing for the body and leather shoes for the feet can, when the air is dry, by moving and twisting their bodies so their clothing will rub against them, produce from their finger ends a spark of electricity sufficient to ignite a gas jet. Can it be that the men who work in powder mills, dressed as above described, in preparing for their work, create so much electricity in their bodies that, when their hands come in proximity with any metal, a spark is given off, which, even if insufficient in tension to explode the powder, may ignite some inflammable gas generated from the chemicals? The powder is exploded, the mill goes up, and the people cry 'spontaneous combustion.'"

A New Idea in Telegraphy.—Telegrams, by a device founded on the idea of the Jacquard loom, may now be committed to a roll of paper, punched with holes instead of letters, and dispatched automatically. The punched roll delivers its message to the instrument without attendance, and the message is printed at the other end of the line at the same time. The advantage claimed for this system is a gain of time, and the liberty to send messages when the line is in the most favorable condition without the assistance of the operator.

Mechanical Progress.

The Burning of Wet Fuel.

Every one knows that blacksmiths burn wet coal dust, and in this way obtain a great heat; but every one does not know that in Northern Germany and Holland almost everybody burns wet coal in the stoves used for heating rooms, experience proving the advantage of this, as by wetting the particular kind of coal dust used there, it takes together in a cake, and the loss of heat by the evaporation of the water is more than compensated for by the solid form the pulverized fuel obtains in consequence of this evaporation. The semi-bituminous coal of this kind comes chiefly from the rich coal mines in Rhenish Prussia, near the river Rahr, one of the tributaries of the Rhine. Similar to coarse sand, with here and there some pebbles, this coal is found in the trade in the pulverulent form, with very few solid pieces, as it has a tendency to crumble into powder. This powdered coal is almost unfit to be burned when dry, as it falls down heavily between the burning parts, closes all openings, and thus smothers the draft, while a large portion falls through the grate unburned.

In localities where this coal is abundant, it is used wet under steam boilers. Of course its use requires experienced hands, so as to keep up the steam, the principal point being to feed the surface of the grate in sections, and not to cover the whole burning surface simultaneously with fresh wet fuel.

There are, however, instances where other kinds of wet fuel may be used with advantage, such as spent tan or sawdust. This has been proved within a few years, thanks to the skill of the firemen or stokers. The furnaces used for this purpose differ from the ordinary ones only in having a brick arch turned above the grates; in others having cone grates with special arrangement and proportions of air space; and with excellent results in a furnace having an overhead brick arch, with a grate so proportioned that a considerable amount of fuel could fall into the ash pit and burn there, and the separate ovens, two or more in number, so arranged that the products of active combustion in one furnace should be mingled *en route* to the boilers, with the products of distillation and with moisture expelled from the fuel, in a similar adjacent oven or furnace, which fuel was at the same time drying under the heat radiated from the furnace walls and arch, and received from the fire in the ash pit, thus dessicating preparatory to subsequent combustion. The latter requisite of preliminary dessication, is secured also by a system of alternate firing of the separate fuel holes in the same oven.

The ordinary furnace used for our ordinary dry coal or wood, and for the wet pulverulent German coal, is unfit for this kind of fuel, as when it is placed on a fire the low dry portions are burned up before there is time to make the upper wet portions dry enough to become combustible.

Withdrawing the grates from under the boiler, and securing a reservoir and radiator of heat by throwing over them a brick arch gives a form of furnace known either as a Morrison or a Crockett furnace, in which wet fuel has been burned with partial success; and when the grates are so set that some of the fuel may fall into the ash pit as it dries, and there burn, the conditions become those of the second case to be described.

Prof. Thurston, of the Stevens Institute, Hoboken, N. J., recently read a paper before the American Society of Civil Engineers, in which he gave an account of his experiments in regard to the efficiency of this fuel when used on a large scale. The first example of a furnace burning wet tan, of which the efficiency was determined by him, was of the kind known as the Thompson furnace, which embodies all the favorable conditions described in the preceding paragraph.—*Manufacturer and Builder.*

Iron Manufacture.—The history of the growth of the iron manufacture in the United States within the last fifty years exhibits a remarkable progress. From a production of 54,000 tons in 1810, it had become 165,000 tons in 1830, 347,000 tons in 1840, and 600,000 tons in in 1850, as near as can be estimated. In 1860, it had reached 919,870; in 1870, 1,865,000; and in 1872, 2,880,070 tons; while the diminished production of 1873, 2,695,434 tons, shows already the effect of the depression under which the iron interest of the country still suffers. Of the production of 1873, very nearly one-half was made in Penasylvania, and not less than 1,249,673 tons with anthracite, while the total amount of charcoal-made pig iron was only 524,127 tons, to which are to be added 50,000 tons of malleable iron made by the direct process in biomaries. The importation of foreign iron and steel for 1872, was 795,655 tons; for 1873, 371,164 tons; and for 1874, less than 200,000 tons. From the figures for 1872 and 1873, we may conclude that the consumption in the United States was then equal to about 3,500,000 tons of iron yearly.—*Harper's Magazine for June.*

A western railroad is now paying $120, gold coin, per ton for English steel rails, in fulfillment of an old contract. The price of American steel rails is now $75. The former figure was the price of English rails before American competition, born and nurtured by protective duties, brought the price down.

Wrought Iron Philosophically Considered.

Dr. Anderson, in his lecture on "Tools" lately delivered at Manchester, England, said: When we think of any sort of material beyond the working treatment of their mechanical properties, we seem to be in another world. Take, for example, a piece of common wrought iron. It seems to us as of the earth earthy, but if we are closely questioned in regard to the reason for its various properties, we find that we scarcely know anything. Tracing it from the ore through its various stages until it is in the hands of the smith is comparatively easy. We know the natural law that governs the elasticity, the limit of its elasticity, its ultimate strength; that it can be welded; that it is ductile, and can be drawn out into a fine wire; that it is malleable, and can be spread out into a sheet, or worked round from the sheet into a goblet, and may be gathered back again, if by so doing it served any useful purpose; but when we think of the marvellous changes which have taken place amongst its molecules during the operation, we are lost in wonderland. To many minds the piece of cold iron seems to be a solid; under the pressure of the testing machine it is shown to be an unstable fluid. When the smith has the misfortune to leave a piece too long in the fire it vanishes; it has found evil companions, and gone off under an assumed name and a new character. When a piece of iron is broken and carefully examined under a microscope, we can see that it is composed of fine crystals; but these crystals, we are told, are composed of innumerable molecules, which are not to be seen by the microscope, being smaller than the human mind can imagine; still, the smith feels himself under their influence. In homely words he speaks of the iron being "red-short" or "cold-short," without thinking that he is on the threshold of some of the impenetrable secrets of nature. The steel maker can take advantage of the molecular properties. With heat he can push them asunder and infuse amongst them the subtle vapor of carbon, and the iron becomes steel, highly improved in most of its mechanical properties, and with an increase of strength and elasticity. It may be inferred that each iron molecule is a little world in itself, surrounded with a thin wrapping of infinite space, no single molecule being in actual contact with any other molecule. We have reached the limit of sub-division, so far as the engineer dare venture. The investigating philosopher, however, ventures much further with his speculations; he tries vainly to penetrate into the supposed ultimate atoms of matter of which the molecules are composed, but further we need not follow. Suffice to say that a piece of common wrought iron is altogether a mystery, and teaches man the lesson of humility.

Ericsson's Solar Engine.

The grand way in which machinery of human invention supplements the beneficence of the Almighty Maker is seen throughout history in the outcoming, from time to time, of some new and vast discovery for utilizing some hitherto useless material. Loadstone, steam, gas, etc., were not new elements, but by new applications of them, the globe was circumnavigated, enginery equal to the manual strength of the human race was created, and night was almost abolished. One of the gravest debates of late years in the British Parliament was had upon scientific reports of the probable time when coal would be exhausted in Britain. So, much trouble has been borrowed from the reflection that increase of numbers is so rapid and the habitable parts of the planet so small. But, if not literally, yet substantially, the old woman's answer is good, that when the known world is full, a fresh Columbus will discover a new one. Thus, Captain Ericsson has constructed an engine to be driven by sun-power, which, if successful, would evoke an illimitable motive power in precisely those regions of the globe where the strength of animals and men is least available. He thinks, for example, that in cloudless Upper Egypt, there may grow a mighty manufacturing nation, while, in effect, the tropics will become the place of labor of the world, and the temperate regions the homes and schools; the cheapness and facility of transportation keeping up their rate of progress.

The wonderful engine is not yet patented, nor its details disclosed. We, however, could spare space at present for but a few hints. The motor is substantially a steam engine driven by heat derived from polarized sunshine, each ten square feet of which yields 33,000 foot-pounds, equal to one horse power, of minimum avails, after all losses and allowances, upon practical experiment. He curiously reckons the stupendous waste of sun-power by selecting out several strips of land making altogether 8,000 miles long, one mile in width, equal to 223,000,000,000 square feet, of which mere chalk-mark on the earth's surface the power wasted would drive more than two thousand millions of one-horse power engines.—*American Manufacturer.*

The Most Powerful Gun Yet.—The construction of a gun weighing 100 tons has been begun by Sir William Armstrong, in England. This gun is to be a muzzle loader, seventeen inch bore, and if successful will be the most powerful weapon ever constructed. Naval armaments are still in a transition state. It is asserted in England that the moment an eighty ton gun is fairly afloat, in a ship built to carry it and use it, the fate of sea going armor clad vessels of the present type is sealed.

MINING SUMMARY.

THE following is mostly condensed from journals published in the interior, in proximity to the mines mentioned

California.

ALAMEDA.

COAL.—The *Independent*, of Jnly 17th, publishes a letter from Capt. Wm. Grey, concerning a visit to the Black Hawk coal mine. We extract therefrom tha following: On Sunday, the 20th inst., in compsny with friends from Ssn Jose and Santa Clara, I had the plessnra of visiting the Black Hawk coal mine, situated about two and a half or three miles in a northeastern direction from Niles ststion. We entered tho tunnel, and I was well satisfied with tha black slate in it. I wonld say that the rock was well defined for coal. We came out of the tunnel and ascended to the snmmit of the mountain, a distance of 700 ft, and there enterad an inclined shaft. The shaft is 100 ft deep, with water in the hottom. I find the vein is 4 ft wide with 2 good wslls well defined. I fiud seams of pure coal in tha vein, and all the vein impregnated with coal. It is bituminons coal and the best that I have ever seen ou the coast. The vein pitches from north to south at an angle of 51 degrees, and its conrse is from east to west. Then wa laft thst mine, and weut in a southwest direction ahont 1 mile, and thera entered another mine called the Cumberlsnd, whera they hsd a tannel in the side of the mountain. That mine also has a fine show to make a good coal miua. Aa well aa oue csu judge, the veins are abont 300 ft apart, aud runniug psrallel with each other. I think the prospect is good, and I am well satisfied it is a coal region.

THE TASAJARA COAL MINE.—Livermore *Enterprise*, July 17: On Sunday last we visited the newly discovered coal mine at the head of Tasajara vallay. It is located in one of the fineat apots, about 2 miles above J. Johnson's ranch, we ever saw. The shaft was but 12 or 14 ft deep, and ahout 6 ft wida by 6½ ft in depth. From the hanging to the foot wall a series of almost solid stratas of coal appeared, running from east to west and pitching to the north at an angle of ahout 42 degrees. The upper half is interlined with a soft blue or slate colored rock, and the lower half has one seam of coal about 18 inches in thicknesa. Tha coal is of a hard glosay kind, and has much the appearauca of tha Cumberland. It has been used by the blacksmith at the mine and with great success. It makea an excellent srticle of coke, and welds finely.

AMADOR.

THE MINES.—*Ledger*, July 17: The Gover, near Dayton, we are informed, is looking remarkahly promisiug, witb a large and well developed ledge at tha 700-ft level. Experts who have recently examined the mine, give it as their opinion from careful observation, that the entire mass of ore below the 500-ft level, will pay by ordinary mill process not less than ten dollars per ton. When a steady motive power shall be furnished to the Gover, its receipta will he satisfactory to tha owners. The ditch from the Amador canal to supply the Gover with water power is now being pushed forward, and will soou be completed.

GOLN mountain may he regarded as a valuable mine. The ledge as far aa sunk upon, will average 12 ft iu width and good judgea inform us tha ore will mill over $10 per tou. In this mine an immense body of pay ore lies near tha aurface, easy of access, and which can he taken from the mine and crushed in the mill attached to tna mina, at a cost not to axcead $2 per ton. The mill will be furniahed with water power from the Amador canal, through tha branch ditch now beiag constructed.

THE Kennedy still improves as work pro gresaes, and is preseuting a very fine appearance. The hody of ore in the deepeat level is very large and very rich, and contiuues so, as far as the workmen have drifted uorth. Everything ahout the miue is very enoonraging.

WORK has been resumed on the Good Hope mine adjoining town and we hope will steadily proceed to a development of the mine.

THE uew mill of the Volunteer mine is nearly r adv for crushing. It will be run by water and employ 10 stamps. The ore in the Volunteer is repreaented as being very rich.

KEYSTONE.—*Foothills Ensign*, July 16: This mine, one of the oldest in the State, never looked more prosperous than now. At no period of its history hsa there been so largc a quantity of ore in aight, and the ore of so good a quality.

THE new mill for the Quartz Mountain mine, near Drytown, ia fast approaching completion. It is expected that it will be ready for work in two weeks. The branch ditcb, however, from the Amador caual to the works, a distanco of fourteeu miles, will take considerable lahor to complete.

THE large sulphurets works, near the Lincoln mine, are nearly completed. Mr. Garland expects to get to work next week. Tbe old works, we believe, will be shut down wheu the uew mill is iu ruuning order, there not heing enough sulphurats to keap both going. The mill will he capahle of workiug four tons per day.

BUTTE.

ELECTRIC.—Oroville *Mercury*, July 16: The Electric mine, near Enterpriae, has its mill in ruuning order. It ia crnahing rock that will pay. The Panl prooess is nsed at this mill and is doing wonders in the way of saving gold. It has beeu tried with the grestest of success on rock from the Forbestowu miues.

FROM a communicstion from Forbestown we lesrn that the mines in thst plsce snrpass anything before known. The company are now engaged in getting mschinery by maans of which all the gold may be saved. At present a large psrt of it is lost, it baing very light. Our correspondent adds, "The company has as valuable deposits and ledges of gold ore, and in such large quantities that thay have as good a honsnza as any iu this State; a 100 ton mill will mske no imprassion on their ora bodies for years to oome. Some of thair tailings taken ont of tha creek a considerable distanoe below the mill contain twelva dollars to the ton. Thus their ore is richer than they ever dresmed of, aud thay find that thay hava wasted enough to pnt np splendid works. They don't intend to waste any more if msohinery oan be got that will save it."

THE HEWITT claim, just on the edge of town, continues to turn out the usual amount of gold. Every thing ia in the best of running order. Good flumes, plenty of wster, and a mountsin of gravel full of gold, no wonder it keeps one man busy packing gold dust to tha express office. This is a closa corporation—so close, in fact, thst it is impossible for us to find out the receipts, but they are knowu to he very large, mora so the past six months than ever before.

CALAVERAS.

SAN BRUNO.—*Citizen*, July 17: Reports from tha Sau Bruno mine at Mosquito continna to be of the most cheering nsture. Very rioh rock has been atruck in the 300-foot west level, the ledga showing fnlly two feet ia width. The work of atoping from the east level is going stesdily on, the ore extracted being all high grada.

BIG YIELD.—Sixty-ona tons of quartz, taken from Lewis & Fairchild's mine, near Leavitt's ranch, Mosqnito district, yielded $2,670—an average of about $44 per ton. The rock came from a depth of about 70 feet, and there is plenty more of the same quality iu sight. It waa crushed in Garland's mill.

AN IMMENSE ledge has heen developed in the 1,000-ft level in the Gwin mine. The vein shows 20 feet in width, and it ia all fair milling ore. Sinking for the 1100-ft level is progressiug rapidly. An abnndance of rook ia being taken out to keep the batteries in constant motion.

CONTRA COSTA.

NEW COAL MINE.—Antioch *Ledger*, July 17: A few weeka siuce we noticed the fact that Mr. Richard Mills, of Somersville, had leased the Corcoran ranch for a term of years, with the intention of developing a ooal mine, on which oonsiderable time and capital have heen expended heretofore. On Monday last Mr. Mills aent tha firat load to Antioch. The quality will be nearly the aame as that of the Central at a similar depth. Mr. Milla ia at present sending in ona six horae tesm daily, but will shortly increase the force of men and teams.

EL DORADO.

THE MOUNT PLEASANT.—*Republican*, July 17: This miue, located near Grizzly Flat, owned hy O. D. Lambard, is at present far the moat promising qnartz mine in the county. Mr. Lambard hss faith in it, aa is ahown in the fact that np to the present time he haa invested ahout $100,000 in it, and now expects a speedy return. He has had a 10-stamp mill erected, which started up last week, snd the first clean-up will probably be made on Saturday of this week. A large amount of rock, which assays wall, lies upon the dump, and there is said to be an endless quantity more in sight.

INYO.

IMPORTANT SALE.—Panamint *News*, July 14: J. J. Dolan, Superintendent of the Panamint Consolidated mining oompany, has recently purohased 3 of the best mines ia the Lookout district—the Keystone, Minuie-Etty and Mountain View. The consideratiou is $60,000, $2,000 of which is paid down, the balance ($58,000) to be paid in 6 moutha, the purchaser to he permitted to enter upon aud prospect the ground in the iuterim hetween the first and last payments. This is helieved to be, by those competent to judge, a very valuable property. The ledges are large, are traoeable for long distances and contain argentiferous or carbonate ores of a very high grade, assaying from $100 to $1,100 per ton iu silver and 40 to 50 per cent. in lead. The district is situated ahont 10 miles east from Darwin and 25 from Panamint.

LOS ANGELES.

NEW MINING DISTRICT.—*Express*, July 17: We have frequently made allusion to the receipt here, from a new miuing district, of specimens of ore, which, on heing assayed, proved to be very rich. A company was organized on the strength of these asaays, and Mr. Gaertner, the assayer and mine expert, procured an outfit and proceedad to the locality of the discovery. It proves to be about forty miles from here iu a northeasterly direction. The route taken is up the Tejnnga canon, theuce across a wide valley, and up in the range of mountains to the east of the Sierra Madre. It is a most difficult place to reach, and its accessibility is obstructed aa well by rugged and precipitous steepa as a dense growth which is almost impenetrable. Mr. Gaertner, who returned from the mines thia morning, asaures us that the district ia a very promising one. He says that at the point where the Charlotte mine is located he traced one lead for four miles, and another for two aud a half miles. He also fouud six distinct veins runuiug parallel with each other. He says the whole country gives evideuces of metallic wealth, sud tha bad rock, in every direction, is composed of quartz. He found that a nnmber of locations had been made there before, and one, made by an Anahaim company, is still being held. He farther assnres us that in a small bottom, two and a half miles from the Charlotte location, ha found placer diggings, covering a space of perhaps 160 acres in size. The gold is cosrse, and if there were water available, the diggings would pay well.

NAPA.

QUICKSILVER SHIPMENT.—Russian River *Flag*, Jnly 17: The Redington quicksilver mining company shipped during the month of June 675 flasks of quicksilver.

NEVADA.

NEW YORK HILL.—*Foothill Tidings*, July 17: A cloud which has for sometime threatened the fair fame of this mina, in the shape of a snit for a portion of the ground claimed by the compsny, has this week heen cleared away. The case, after several postponements, came up for trial in the Distriot Court and was decided on Weduesday last; tha jury bringing in a verdict for the defendaut. The following is the latest officisl informatiou from the mine: There ara 15 stamps running, capabla of reducing 30 tons in 24 hours. The main shsft is below tha 2d level 39 ft, ledge large snd of good quality. The east drift from the 2d lavel is in 78 ft, ledge small, with indications that it may enlarga as it advances. The stopes are looking better than ever between Nos. 1 and 2, west side. The ledge averages ovar 18 inches, with the most excellent pay rock. The raise is up 138 ft from the tnnnal, ledge large and good pay. The winza ia down 29 ft from the upper tunnel, and the superintendent soon expecta to strika the ledge here. During the week 60 tons of ore wara raised, 60 reduced, and there remains on the dump 302 tons.

EUREKA.—Iu addition to the work iu the cross-cut on the 13th level, which is now harder ground than usual, and in Eureka No. 2, Superintendent Watt ia having a shaft sunk on the Roanuise ground, which is now down nearly 30 ft and tha gronnd is said to ha better than waa expected.

THE V Fluma is now completed to aloug the slope of Banner mountain and is to ha fiuished to the Town Talk Houae, between here and Nevada City, by the firat of August. Here the work will rest for a time, as the finme company haa the contract for anpplying ties and timbers for the R. R., to be used between here and Nevada and they will he delivered at that point.

MR. FBYER assurea us there is no such word as fail in tha matter of his enlarged works for treating ores by his new process. From two to thrae months will he raquired to complete the larga establishment, hut in the meantima tasta will be made of small lots of ora from any part of tha country.

FINE SPECIMENS.—Grass Valley *Union*, Jnly 17: Supt. Snydar brought np from the New York Hill miue yeaterday, another lot of specimens. Thay came from all parts of the miue; tha maiu shaft, the stopes above the aecond level, and from the extreme end of the drift running toward the former workings of tha old company. All of the rock was very rich in free gold, bnt that taken from the main shaft, forty feet below the second level, not only ahowed gold in abuudance, hnt was mora heavily oharged with galena and anlphureta than any whioh has heretofore heen taken from the mine.

PLACER.

SANGUINE OF A GOOD CLEAN-UP.—*Argus*, Jnly 17: The Aubnrn gravel mining and ditch company are rnnning day and night, and with their fine water power are making the hills tremble and the gravel disappear at a fearful rata, whila the honldera at the ssme time are flying in all directions. The oompany ia saaguina of the largest clean-up ever made in this connty according to the number of inches of water nsed.

THE St. Patrick mill claaned np on the 8th of Jnly for a month's run, of which there were only twenty days actual running time, the reaalt proving satisfactory oousidering that after the mishapa to the old boiler, only the power of a common donkey was at command for hoisting in the miue, necessitating a reductiou of the common working force. The delay in putting the donkey np, with the good time that every one was bound to have about the time honored Fourth of July, caused a still greater reduction of the working time for the month. The total hollion product shipped in bars was 643¾ onnces; of which 244 onnces was the yield from 87 tons of rook taken from the 440-ft level, and 301¾ ouuces from 283 tona rock from the 312 and 360-ft levels. A new hoiler haa heen set np at the Crater mine hoistiug works, promising suffioient power for a still more ancoesafnl working of the mine.

IN FULL BLAST.—*Herald*, July 17: The Aubnrn gravel mine is running in fnll hlast. In eight fnll days' rnu they piped off, at the lowest estimate, 10,000 yards of gravel, and expect to run off that much more this week. As they get fairly into Grizzly hill they find the gravel bed deeper, and the extent of the hill even more extenaive than they had calculated. The amalgam in the slnice aud underenrrents is thickening up, and every indication promises an exceeding rich clean-up.

PLUMAS.

NORTH FORK.—*National*, July 17: The North Fork mining company cleaned np on Saturday last, after a run of twenty-three days, and took out 600 ounces. They have suspended work for a few days in order to ohange the pipe over to tha west side of the hill, aud as soon as thst job is complated they will commenca piping again. Everything promises well, as in this rnn they washed top dirt, being some 20 ft above bedrock. The tunuel claims are paying well. In one drift, working five men, they clesn up from seven to twelve ounces per day.

MR. R. L. HOBART will commence crushing quartz from his ledge in Argentiue in a few days. He will use the nine-stamp mill which formerly belonged to Judge Moora.

THE contractors for the ditch work of the Giant gravel miniug company, Mr. A. J. Gould, superintandent, commenced work on Mondsy last.

PIERSON, WINTERS & Oo. are still driviug their tunnel into the hill, this side of Nelson, snd getting blue gravel aud good pay. They hava not got bedrock.

A MOST flattering gravel strike hss recently heen made by Smith, Anstin & Oo., near Butterfly valley. Their claim promises to be one of the richast gravel mines in tha county.

SANTA BARBARA.

QUICKSILVER.—*Index*, July 10: The first shipment, consisting of 29 flasks of quicksilver, from the Los Prietos mines, passed down Ststa street to the wharf lsst Mondsy. A fair heginniug.

SAN BENITO.

QUICKSILVER DISCOVERY.—Hollister *Enterprise*, July 17: Exceedingly rich and promising discoveries of ciunabsr hsva lately heen msda in the Coast range, adjoining the Stayton mining company's property, on the northwest. The ownera are R. G. Stayton, Dr. Crapiu, R. M. Shackelford, J. L. Murphy and T. L. Baldwin. Cousiderahle work has alresdy beeu doue in the way of cutting tnunels, sinking shsfts, etc. Tha company has bean incorporatad under the title of the "Consolidated Wonder oompany" and it is the intentiou to vigoronsly prosacute the work of development. Seven looations have been mada and so far aa prospected, all look well. One discovary—the "Doctor'a Wonder"—is said to be the moat flattering aurfaca proapect aver found in Califoruia. The vein is 60 ft wide, and some of tha hest qnality of ore has heen takeu ont from a depth of a few inohes. From preseut indications this hids fair to be one of the bast quicksilver minea of tha State. These mines are all in San Benito connty, aad only abont 10 milea distant from Hollister—a nice prospect for au increase of revenua.

IRON ORE.—A Mr. Thompson and others have recently discovered an immense body of iron ore, near the summit of the Gavilan mountains ahout 10 miles sontheast of Hollister. The croppings are traceable for aeveral milea. Specimans from these mines were assayed at San Francisco and Santa Olara, yielding 89 per cent. iron. The metal haa beeu pronounced by experts to he the very best yet fonnd on tha Americau Continent—equal to the finest of Switzerland.

SAN DIEGO.

THE HUBBARN.—*Union*, Jnly 15: We are indebted to Assessor Shaffer for a very rich specimen of qnartz from tha Hnbbard miue, of Bannar district. We learn that the company now have a tunnel in 300 ft, where there is a vain 4 ft wide streaked with just snoh ore as the specimen referred to. They propose to erect a mill to be rnn hy water power, and operatious will go forward immediately.

SISKIYOU.

QUARTZ INTERESTS.—Yreka *Union*, July 17: The quartz interests on this aide of the county are at preseut decidedly auimated. The Eliza mill will he started up next week on rock from that company's ledge, aud the prospects are that it will pay well.

THE workmen at the Clark & Cornish ledge hava been engaged in taking out rock for some weeks past, and have now aome sixty tous on the dump. The rock of this company will be taken to the Eliza mill for crushing. The proprietora of the mine are talking ahout huilding a mill this fall. Their rock ia very rich.

THE four-atsmp mill at the Adelaide ledge, on Humbug, ownad hy Warreu and others, is now being removed and put up on Greeuhorn, to work the rock of a ledge owned by Messrs. Abhot, Edgerton, Warren aud others. It is the intention to ruu the mill by steam. The rock takeu from the ledge has every evidence of being very rich, and the owners inteud to give it a thorough trial.

SONOMA.

MINING ITEMS.—Rassian River *Flag*, Jnly 17: T. N. Wand, of San Francisco, has honght a controlling interest in the Excelsior, and proposes to put meu at work at an early day—perhaps this week. Some alterations will be made in the condensera of the farnace, which, it ia believed, will cause the furuace to work satisfactorily.

THE Brandt miue (Cinnabar district—adjoining the Bacon), was sold laat Monday to an English company for $30,000.

CAPT. BILLY WILLIAMS, formerly Superintendent of the Opbir of Nevada, and latterly Superintendeut of the Redington, has been elected Superinteudent of the Blne Jacket gold and silver mine, near Piue Flat. Twenty men were put on the mine last Monday.

OCCIDENTAL has strack good ore—working 18 men. Geo. A. Koch is Superinteudent. The mine haa over a mile of tnnnels, and ia looking well.

LIVERMORE furnace (near Cloverdale) started up again laat waek. About 30 men at work.

A MARBLE quarry has bean discovered on the Live Oak, near Cloverdale.

TUOLUMNE.

MINING ITEMS.—*Independent*, Jnly 17: Sinking on the Lady Washington will be commenced at once. A contract has been let for 100 ft in depth. It is the intention to go down 300 ft fnrther if the indications are favorable.

TWENTY stampe ere running at the Confidence mine, ell bneily engeged in pnlverizing the 100 tone of rock on the dump. The broken up vein, in the developing shaft, givee indications of coming in eolid end rich.

Nevada.

WASHOE DISTRICT.

OPHIR.—Gold Hill *News*, Jnly 15: The ore breasts recently opened on the 1500 and 1600-ft levele are mnch better than wne expected, and promise a fine yield of good ore for the fntnre. The face of the north drift from the bottom of the northeast winze, on the 1600-ft level, ie still in good ore. No new developments have been made dnring the week by east cross-cnte Nos. 4 and 5, on the 1700-ft level.

CALIFORNIA.—Cross-cnts Nos. 5 and 6 on the 1500-ft level are eteadily advancing to the east-ward, the face of both etill in good ore. The lateral drift rnnning in the ledge on thie level hae been connected with croee-cnt No. 4, and ie now being pushed rapidly ahead to connect with croes-cut No. 5. A drift has also been started from croes-cut No. 5 to meet and connect with this leteral drift. All of theee drifts are in good ore. The ore developmente on the 1400-ft level going toward the Ophir line are much richer than wae expected, adding greatly to the value of the mine. Sinking the C. & C. shaft ie making splendid progrees. The erection of the new mill ie feet getting in shape for a swift and speedy oompletion.

CONSOLIDATED VIRGINIA.—Daily yield 600 tons of ore. The mine is looking splendidly throughout, all the levels continuing their regular yield of rich ore, without any indication whatever of exhanetion. The lateet bullion returne obteinable, which are up to the 13th of the month, showed at that time $184,003.80 in the office, to $105,998.16 at the eame date in Jnne, giving an excess for the present month over that of last month of $78,005 64, which has probably increeeed hy to-day to near $100,000. The mills are all running eteadily, and if no interference is caueed hy a slackening of the supply of water the yield will be fnlly np to, if not in excese of, that of last month.

CHOLLAR-POTOSI.—Daily yield 60 tons of ore, the aseay value of which is $26 per ton. Sinking the main incline ie making the neual good progrese. Driving the eonth proepecting drifte on hoth the 1150 and 1250-ft levele afforde no new featnres whatever. Sinking the new shaft is being preseed with all the epeed poesible, everything being done in the most thorough and snbetantial manner. Thie ehaft when completed to the point at which it will intersect the ledge, will withont doubt he the model shaft of the Comstock.

OVERMAN.—The pnmp at the 1000-ft level was etarted np yeeterday, and ie rapidly draining the water below that point. Everything ie now in fine working condition.

SOUTH CALIFORNIA.—Sinking the main shaft is going steadily forward, the bottom still in ledge matter mixed with streaks of quartz of a very fine character.

BULLION.—Cleaning ont and repairing the old incline ehaft ie being pressed ahead with all the energy poesible. The north drift from the Imperial, is eteadily advancing, the quartz and ore showing a eteady improvement and adding confidence daily to the expectations of the development of a good paying mine.

IMPERIAL-EMPIRE.—The recent connection of the worke on the 2000-ft level with the air winze from the level above, is furnishing a good draft of air, whioh is gradually cooling off the winze and drifte eo that it will not now be long before the prospecting of that level can be commenced in good earneet.

SAVAGE.—Sinking the eouth winze, below the 2100-ft level, is making eteady and favorable headway. Driving the north and south drifte on the same level hae produced no importent reenlts during the week.

CALEDONIA.—Sinking the new shaft is making the same rapid progress as heretofore. The flow of water oontinuee quite strong, bnt ie easily handled by the pnmpe. The new hoisting worke building ie nearly completed; also the foundations for the heavy hoieting and pumping machinery; in fact everything at the new works ie making all the progreee poesible.

LEO.—Good progreee is still being mane in sinking the winze below the main tnonel level. The ledge ie well defined, and the hanging wall ie smooth and unbroken. The ledge material ie of the Cometock character, and ie eteadily improving in quality as greater depth is attained.

COSMOPOLITAN.—The air connection being completed in the etopes, giving much needed ventilation, ore extraction at that point is reeumed, and the Hope mill will start np again the first of next month. The winzee below the main tunnel level are showing well in ore.

NORTH CARSON.—The face of the main drift is in a little softer material than it wae last week, and every indication showe that the main ledge is near at hand. The quartz eeams or feeders pessed through continue giving good aesays.

ORIGINAL GOLD HILL.—The south crose cuts continue in fine ore, and a good sized body of it is already developed, which can be made available as soon as proper extracting arrangemente are made.

PIOTOU.—Some very fine feeders or seame of quartz carrying metal have been paseed through of late, and the main tunnel mnst be approaching the ledge.

BELCHER.—Deily yield 500 tone of ore. The ore breeets etill promiee a goodly yield, and the openinge on the 1500-ft level are abont eufficiently advanced to begin the extraction of ore from that portion of the mine. The opening drifts of the 1600-ft level are eteedily advancing, bnt hnve not yet reached the ore vein. The air shaft ie nearly completed to the 1200-ft level. The mills are doing good work and everything ie looking bright end proeperons.

CROWN POINT.—Daily yield 500 tons of ore. The ore breaete are all looking well and yielding the nsual amount of ore. Preparatione are being made for a more complete exploration of the 1600-ft level.

JOSTICE.—The main incline is in hard rock with plenty of water. The workinge at the 400-ft level and below, in the south mine, give a fine ehowing of ore, nnd more and more of it.

NORTH CONSOLIDATED VIRGINIA.—During the week there hae been bnt a slight increase of water. The new steam hoisting and pumping machinery ordered will be along shortly.

AMAZON AND GLASGOW.—The new engine ie in place, ready to etart up. Sinking the winze in the eenth drift at the first station level ie making good progrees, the bottom still in qnertz and ore.

UTAH.—The water is drained from the shaft, and the bottom ie being cleaned end retimbered preparatory to reenme the einking. The new pumping and hoieting machinery ie jnet what was needed, and is doing ite work to perfeotion.

SOUTH COMSTOCK.—Bottom of shaft in eplendid ledge materiel, mostly quartz, giving good aeeaye. Valuable ore depoeite may be looked for at any time, ae the proper point for the same ie now being arrrived at.

NEW YORK CONSOLIDATED.—The masqn work for the foundatione of the powerfnl new hoisting and pnmping machinery, is being pnshed ahead as faet ae is compatible with snch snbetantial and permanent arrangements.

NEVADA.—Cross-cutting at the lower level in low grade ore of a very promising quality, which is expected to develop into eomething richer before the vein ie cut through.

SUCCOA.—Still driving the prospecting drifts on the 550-ft level, with some very encouraging indicatione of nre developmente ahead.

JACOA LITTLE CONSOLIDATED.—Plenty of ore is developed by the main west drifte and cross-cuts, and the work goes eteadily forward.

HALE & NOACAOSE.—Sinking the main incline hae been suspended at a point 50 ft below the 2000-ft level, for a few daye, for the purpoee of opening a etation and starting drifts for the prospecting of the mine at that point.

JULIA.—Sinking the main ehaft ie going rapidly forward; the Burleigh drille at the bottom are doing eplendid work, and greatly aiding the speed. It is now down a little over 1400 ft.

LANY WASHINGTON.—The fonodatione for the new machinery are ahout completed. The heavy caetings are being placed on the pump-bob preparatory to lowering it into place. In a day or two more everything will be in reediness for commencing the putting in of the pumps.

Arizona.

"THE OLD MINE."—*Citizen*, July 10: "The Old mine"—eupposed to be the old Tnmacacori—has recently been discovered by Henry Allen, and ite ehafts and tnnnele are now being cleaned out preparatory to further development and actual mining. Money enongh hae been put up to clean ont the old works and rnn the lower tunnel 100 ft under all the old worke, and the work is now being done under direction of Mr. Darrah. The present evidence of the extent and richnese of the mine are ample. There ie a very large dump of ore worth an average of $50 per ton, the lowest grade aeeaying $7 and the higheet $7,000. Thie dump evidently consiste in the main of the refuee ore at the time the mine was worked many yeare ago. Already, in cleaning out the mine, Mr. Darrah has found two sacke of eilver ore worth at the rate of $7,000 per ton. He finds the old drill holes to be four inchee eqnare, proving that the work wae done very many years ago. He also fonnd ekeletons in the old worke, leading to the belief that the workmen staid by the mine nntil they were murdered, and this theory ie etrengthened by the very rich ore found on the dnmp, which in caee of abandonment would very likely have been taken along. Until cleaned ont, the preeent extent of development cannot be known, bnt a number of ehafte and tunnele are plain enough. "The Old mine" is in the Oetrich monntain range and is abont seventy-five milee eouthward from Tucson. Wagons can eseily be taken within two or three miles of the mine. Wood and water are plentiful and near the worke.

Idaho.

SILVER CORN.—Owyhee *Avalanche*, July 17: The new shaft ie down 105 ft helow the 3d level, end hy eioking 10 ft further, there will be 140 ft on the incline of good etoping gronnd. The machinery moved from the old ground ie doing ite work well. The perpendicular shaft intersects the winze and the ledge 305 ft below the eurface. The distance from the old ehaft to the new ie about 250 ft, and the character of the operations thus far will necessitate the etarting of lovele and the commencement of etoping at an early day. The prospecte are very favorable. The shaft ie now in new ground, and from the proepeoting that hae been going on in that direction it ie certain that a rich ore chute exiets there. The ledge ie 16 inchee in width and although rather narrow develope a fine pay etreak from which the most promieing resnlte may be expected. The ore in considerable qnantitiee will in a few weeke be fnrwarded to the mill for crnehing.

BELLE PECK.—The point at which the ledge has recently been etrnck preeents some remarkable developmente, indicating the exietence of a very prolific mineral belt, from which nntold wealth is liable to emanate.

POOAMAN.—Three cross-cnts ere in, and a fonrth will be etarted on Monday. The ledge will be intersected in a few daye, end there is a degree of anxiety awaiting developmente. Sinking has been diecontinned for the preeent, end the operations are confined mainly to croes-cntting.

EMPIRE (Idaho).—The raise from the 6th level is completed to the 5th; ledge being in the reise from 3 to 5 ft wide, ehowing eome very fine ore. The Snperintendent expects to etrike the ledge in crose-cnt from the 5th level drift within 2 or 3 days. The 6th level ie eonth 140 ft, end showing very favorable.

THE LEONARD MILL.—R. H. Leonard hae nearly completed hie new qnartz mill, which ie located on the grounds of the old Mineer mill, about a mile and a half from town. It will have a capacity of crnshing 15 tone of ore per day, and ie eo conetrncted that the machinery can be duplicated at any time hereafter and the capacity increeeed to twice that quantity. The wood work is being pnt in for rnnning 5 stamps, and the operatione will for the present be confined to that nnmber.

Oregon.

PRONUOT OF THE VIATUE MINE.—Bedrock *Democrat*, Jnly 14: On leet Tnesday we were shown, at the banking house of J. W. Virtne, three beautiful gold bare, the result of sixteen days' rnn of the Virtue mill, from rock from the Virtue mine, which were of the value of $9,633 40. Thie mine ie improving in appearance end richneee at every lick of the pick or drill that ie strnck in it. It now furnishes employment for from 70 to 100 hends. New hoisting machinery, boilers, etc., were shipped on the 2d of thie month from San Francisco for thie mine.

Progress at the Sutro Tunnel.

The following ie the report of progrees in the Sutro tunnel, for week ending Jnly 15, 1875:

Number of feet in tunnel, July 8,.....	9,979
Number of feet driven during week.....	70
Distance in, July 15,.....	10,049

Details of work performed are ae follows, heading being 8x10 feet:

Holes drilled.....	294
Holes blasted.....	355
Aggregate depth.....	1668 feet
Average depth.....	6.35 feet
Powder consumed.....	836 lbs
Exploders consumed.....	356

ROCK.—Andesite, very hard to drill, but fair blasting.

WATER. — Qnantity flowing, forty-eight miners' inchee.

AIR.—Temperatnre at mouth, 83 deg.; at ehaft 1, 61 deg.; at shaft 2, 79 deg.; at header, 83 deg.

[Signed] A. SUTRO, Gen. Snpt.

A NEW REVENUE COTTER.—The Portland *Bulletin* says: The revenue outter, authorized by Congress, the contract for the construction of which hee been awarded to the Oregon iron worke company, at Albina, will be a novelty in her way. Having no uee for the depth of hold, which a veesel of her draft and general dimensions would possese, the plan provides for her being built eolidly np to the water line; the interior being filled up with eolid timbers, braced and bolted together to within five feet of the oar lines of the spar deck, all of whioh is to be eo closely fitted and caulked that the veeel would be dry, even though her outeide planking was entirely omitted. Throngh all thie mase of timber, the bed plate of her machinery ie to be bolted, and to a novice in the eervice of shipbuilding it would eeem ae though there will be no end to her strength. The spar deck, instead of being laid on car-linee, rounded off to a oircle, and dove tailed and fastened in the nsnal manner, will he composed of two long knees eplioed amidships, the ends resting on the eolid timber below, and bolted to the frame in the moet approved manner. The eolidity of the vessel in general will be better understood when we say thet it will take over 350,000 feet of lnmber to complete the hull, independent of the deck hamper.

A BAIDOE DESTROYEN AY FAOST.—On the 15th of February last, the iron bridge whioh epans the Olonaba river at Peterboro, near Toronto, Canada, suddenly fell and was ehivered "to atome," ae the diepatch read. An inquiry into the particulars of the occurrence reenlted in the following report:

"The hridge wae a bow-string hridge, oonetrnoted hadly—the linke far too emall, and no provieion made for contraction or expaneion—and, to sum np, the iron was of the woret kind, there being no eupervieion of the work. The oontractors did ae they pleesed. Our winter hae been exceedingly severe, and the contraction necessarilly great, and it is euppoeed that the links broke under the severe strain."

BEAR FRIGHTENED TO DEATH.—One of the black bears, introduced into the pit with other beare last week, at Woodward's Gardene, was frightened so that it died.

WOODWARD'S GARDENS embraces an Aquarium, Museum, Art Gallery, Conservatories, Tropical Houses, Menagerie, Seal Ponds and Skating Rink.

General News Items.

A DISPATCH from London nnder date of the 21st inet. seye that heavy raine have been falling in Lancashire and Yorkshire, and edjoining countiee. The river Calder has overflowed its banke for twenty miles, from Helifax to Barneley. Roede are submerged, also meny streete and honsee in Todmorden, and the Eastward bridge hee floated awny. The Don threatene to inundate the low-lying parts of Sheffield. The Ribble has risen and overflowed the country for a distance of thirty miles.

MONDAY night, of leet week, a bend of sheep belonging to Mr. Ashurst, of this city, were running along the edge of a precipice back of Mission San Jose, when the leader, by some means, lost his footing and was hnrled down the steep declivity. The rest of the flock followed to the number of 800, or, as estimated by others, 1,200 to 1,500 head. All that fell were inetantly killed.

DONALD MCLENNAN, Esq., has returned from a visit to Washington, where he was very successful in negotiating contracts for woolen goods, products of the Mission woolen mills, with the War Department. He has received contracts for blankets and woolen clothe amounting to $300,000.

THE triel of John D. Lee, the Mormon, for complicity in the Mountain Meadow meseacre is now going on at Beaver, Utah. Lee hae made a confession, but it has been rejected by the prosecution.

SECRETARY Bristow stands firm in his purpose to sell the distilleries lately seized for fraud practiced by their owners. A considerable excitement among the whiskey men is the result.

FEMALE nominees have been named for the office of Superintendent of Schools in the counties of Inyo, Butte, Marin, San Luis Obispo, Santa Barbara, Shasta and San Diego.

THIRTEEN miners and four wagons were captured last Friday, forty-five miles north of Fort Laramie, en route to the Black Hills. The miners were sent to Fort Laramie on parole.

A cloud-burst in Winnemucca valley, Nevada, the other day, flooded the ranches of George W. Hepperly and Frank Dickson, ruining their crops completely.

THE Commissioner of the Land Office has rejected the survey of the Rancho Cnyama, located in Santa Barbara county, Cal., and ordered a new survey to be made.

A SMALL bird, known as the groesbeck, is destroying the crop of potato bugs in Colorado, and that afflicted people expect a pretty good crop yet.

THE Turkish Government has ordered the Governor of Bosnia to dispatch troops against the insurgents in Herzegovina.

THE Carlist general, Dorregeray, is said to have reconstructed his army and repulsed a party of Alfonsists.

THE publishers of the Sonoma *Democrat* will commence the publication of a daily on the 25th instant.

A COUNCIL of delegates from all Presbyterian churches in Christendom is now in session in London.

THE American squadron which has been lying at Cronstadt, Russia, has sailed for home.

A GENERAL strike among the Lancashire cotton operatives is said to be imminent.

THE American team positively decline to shoot another match.

Industrial Items.

ABOUT three-fourths of a mile of the Petaluma and San Rafael narrow gauge railroad has been graded. One hundred and forty men are at work on the tunnel of the big hill, near San Rafael. It is estimated that it will take ten months to complete this tunnel.

THE Grass Valley *Union* says the railroad is progressing famously and that the tunnel between Bear river and Greenhorn is now in 105 feet and the ground is very favorable for rapid work. The Bear river bridge is being pushed ahead with all energy.

THE engineer of the San Francisco, San Mateo and Santa Cruz railroad states that he has been able to get a very favorable line both as to grade and alignment, and recommends a tunnel through the Tom Moore hill, between Pomponin creek and Pescadero.

THE yacht *Effort*, under sixteen tons, which left Fleetwood, England, May 29th, arrived at St. John's on the 19th instant, after a voyage of forty-nine days, which was remarkable for heavy weather. The crew consists of captain, mate, and two boys.

REN BLUFF is moving in the matter of a woolen mill. A steam flouring mill of great capacity is about completed, and a foundry to utilize the iron lately discovered in the neighboring county of Shasta is talked of.

THE San Bernardino *Advertiser* says that a twenty-five horse power steam mill has been ordered from the East to be located in the mountains north of Gilman's ranch.

THE English land reclamation company, whose large tract of marsh land in the vicinity of Centerville is being dug and turned over, will place 1,000 acres under cultivation next spring.

A SOAP manufactory has been established at Petaluma.

Grass Valley Mines.

The *Transcript* of last week says: We took a little run among some of the mines in this vicinity Thursday, and found most of them busily at work and doing well. The Providence, one of the largest in this district, is at the present time looking remarkably well—much better than ever before. Such rock as is coming to the surface now, proves what we have repeatedly asserted, viz: that it is one of the best mines in the county when thoroughly opened. It must be remembered the present company have only had control of it for about three years, during which time they have had to commence everything anew. New machinery, new shafts, new sulphuret works, new mill, and all their works have been put up since they came into possession of the mine. During the time, they have merely been prospecting among the mountains of quartz belonging to them. The ledge has been all sizes, from eight feet to fifty feet in width. Any of it will pay for extracting and milling, and a greater portion will yield a nice working dividend. Recently in the 600-foot level, about 250 feet south of the working incline, a body of ore has been struck which far surpasses in richness anything yet found in the mine. The ledge is eight feet wide and the rock will average one-half sulphurets. A great portion of it is fully four-fifths sulphurete and galena. This body has been run on eighty feet horizontally, and sixty feet perpendicularly, and through the whole distance the character of the rock is the same. What has been taken out while running the prospect drifts has been saved, and will be worked by the Fryer process. Old miners who have seen the rock think it is a little ahead of any sulphuret rock they ever saw. There is one thing connected with the discovery of this ore body worth mentioning. The company were running drifts in the direction of it but were only doing so out of curiosity, to see what kind of rock lay in that direction. When Godfrey, the "mining wizard" came around here, he visited the Providence, and in company with some of the employees, he walked on the surface to the southward, following the ledge. When he reached a distance of about two hundred and fifty feet from the working shaft he stopped, and told his attendants there was a body of ore underneath richer in mineral than anything they had yet seen in the mine. The owners afterwards continued their drift in that direction with as much dispatch as possible, and soon reached the point designated. The prediction of Godfrey was verified.

It is but justice to say his "guesses" have been proved true in numerous other instances here and elsewhere in the county; and old miners who have heretofore believed that "silver and lead run in leads, but gold is where you find it," now think that Godfrey can in every instance tell where it is to be found. Several shafts are being sunk about here for the purpose of testing his ability, and it will shortly be demonstrated whether it is guess work with him or whether he can really tell where mineral can be found with certainty. At all events the owners of the Providence are satisfied he told them truly.

The Nevada Mine,

Which is an extension of the Providence, and is on the opposite side of Deer creek, is no doubt an equally good mine, if it could be as thoroughly explored and developed. At present the mill only crushes "tribute" rock. The mill and hoisting works are run by water power, and ore that will pay five or ten dollars per ton can be worked with profit. We understand the ownership is about to change hands. By the investment of a little capital in further developing the mine it would become productive property.

The Wyoming

Is situated about a quarter of a mile below the Nevada on the banks of Deer creek. The company own two ledges, one of which is called the Ural, and the other the Wyoming. Rock is being taken out of the Wyoming on shares, and is crushed at the mill owned by the company. It is very low grade ore at present. Godfrey, when here, walked over the Ural and designated a point where good ore in large quantities could be found; and a shaft is now being sunk on the spot to test it. It is near the mill, and where no one supposed the ledge ran. If this prediction proves as true as it did in the Providence, the company will have a good thing. The shaft is now down forty-five feet, and drifting to strike the ledge was commenced Thursday. A few days will tell the story.

The new shaft on the Gold tunnel is being pushed ahead rapidly, and the machinery will be removed to it as soon as completed. Godfrey also passed over the Gold tunnel near where the shaft was being sunk, but he did not know it, nor could he see it. When he reached that point, however, he told those who accompanied him that there was a rich body of ore underneath. Harvey Helm, we believe, once took out very rich rock under the same spot. Of course the Superintendent did not stop sinking the shaft because Godfrey confirmed him in his belief that rich rock was underneath.

The Manzanita

Is daily improving. The gravel is growing better all the time and seems to increase in extent. There are now about sixty white men employed in hydraulicing and drifting, and more will be put on shortly. It seems the direction of the channel has now been so nearly determined that those all along the supposed line of it have perfect confidence they can strike it in a short time. When that is done gold will be taken out by the bushel daily (as it were). There is considerable prospecting for quartz going on in this vicinity, and we learn the result of crushings are encouraging.

The old Stiles ledge is being worked by a whim, and the rock looks well. Hinds & Co., are taking out rock just below the Gold Tunnel, and Mattingly is prospecting still further down the creek. Altogether the mining situation of the district looks well.

Sam. Eddy and Jesse Holcomb a short time since commenced to run a tunnel from the old American Hill claims, situated at Rogers' ranch, and which were worked out and abandoned years ago, thinking that by running from the bottom of the cut south, they might find a small body of gravel or a channel. After running about eighty feet they did strike gravel, and gravel that prospects as high as two dollars to the pan, and it is now thought they are on the regular ancient river channel—the same as found in the Manzanita. A distance of twenty feet has been run across the gravel, and no signs are yet manifest of its giving out. This is another discovery showing which way the channel runs. There is every evidence now of mines being at work in a few years for miles on the same ancient stream.

On the Rough & Ready ridge, at the head of Peck's ravine, a company called the Excelsior, have been running a tunnel for the past two years for the purpose of striking a gravel channel supposed to run along that ridge. The tunnel is now in about eight hundred feet, and it is now thought that twenty or more feet will reach the channel, as all the indications are favorable. The members of the company are Wellington, Frank Beatty, Maltman, Williams, and others. The Murchie gravel mine is supposed to be on the same channel. McCormick's ground is also supposed to be a part of it. Gold Run has been very rich and there is but little doubt the gold came from this channel running above in the ridge. The tunnel being run through Town Talk hill may cut the channel, as it must run near that vicinity.

The Cold Spring company, whose ground is located east of the Harmony company, on the Washington ridge, about one mile east of the Nebraska, have commenced to sink again on their old incline, which is about 180 feet deep, for the purpose of striking down to the bottom of the channel running through there. The ground has lain idle for some time, but since the recent discovery on the line of the old channel running around Sugar Loaf they have resolved to sink and develop what is known to be rich ground. They expect to strike the channel in about two hundred feet.

Coal for the Comstock.

The Virginia *Chronicle* says: A mineral discovery has been made within twenty miles of this city, which, if present indications are to be relied on, is only second in importance to the bonanza. In 1862 some shepherds, while drinking in the creek in El Dorado canon, a few miles beyond Devil's Gate, had their curiosity aroused by a brownish black substance, which cropped up in the bottom. They carried specimens to town, where it was declared to be a species of coal. Messrs. Kelly, Crozier and O'Brien located a claim, organized a company, and upon sinking a shaft discovered a considerable body of the mineral. In 1863 a yard was set up on the Divide, and it seemed for a time that Virginia would be freed from the heavy tax of wood. The great expense of hauling, however, soon discouraged the owners of the mine, and upon their yard being destroyed by fire, they abandoned the work.

A Live Company Organized.

The fact that coal had ever been discovered in El Dorado canon had almost passed from mind, and nothing further was done to develop the mine until April of last year, when the Virginia City coal company, composed of R. M. Daggett, President, M. Lynch, Superintendent, C. C. Stevenson and James Kelly, Trustees, was organized with a capital stock of $1,000,000. The work of sinking the shaft and running drifts for prospecting purposes was begun with vigor, and has gone forward ever since. The developments have been of such a nature that there is no reason to doubt the existence of a gigantic coal field. Three levels have been opened. The chief work has been done on the second and third. The lower level is down 180 feet, with a drift running due south 480 feet, with a cut off of 400 feet, making a sort of fork. The whole distance is through a solid mass of coal.

The Amount of Coal in Sight.

On Tuesday last a *Chronicle* reporter visited the mine and made a careful examination. The course of the vein is southeast and northwest, with a pitch of twenty feet in the 100. The width is in some places as great as fourteen feet, but lessens to about eight in others. The average width is about ten feet. (The Mount Diablo mine, which produces such vast quantities of coal, has a vein of scarcely three feet in width.) Another drift is being pushed forward with the most promising indications. On the second level there is a drift of 270 feet with an incline winze running down through the vein 380 feet to the lower level (where a length of about 700 feet has been developed) the pitch of the vein gives about 900 feet to the surface. Calculating the width of the vein at ten feet and the distance to the surface 900 feet and twenty cubic feet to the ton, it is found that 315,555 tons of coal are already secured. No diminution of the vein is shown at any point. Every drift or winze that is run tends to demonstrate that the deposit is practically inexhaustible. The company could with present facilities take out 200 tons per day, but wagon hauling is so expensive a mode of transportation that it would hardly pay. Their energies are, therefore, devoted to ascertaining definitely whether the dimensions of the deposit will justify the expense of a railroad.

A Geologist's Opinion of the Mine.

Professor Denton visited the mine in December last, and pronounced the vein inexhaustible. The coal he declared brown lignite, and from the geological character of the ground assured the superintendent that at a greater depth coal of better quality would be found. His prophecy was justified a month later, when on sinking the shaft for the purpose of opening another level, a firm black coal was struck. Water drove the workmen out, however, and the company have determined to prospect the upper works thoroughly before going deeper. The *Chronicle* reporter bore off with him a section of a tree turned into coal which had been taken from the sump. It is hard, black and lustrous. Colonel Lewis, the coal expert, has also been at the mine, and his decision as to the extent and prospects of the deposit agree with those of Professor Denton. Professor Frank Stewart also made an examination and endorsed the opinions of the other scientists.

A Second Vein Discovered.

In making the excavations for the hoisting works another vein was discovered. Boring is now going on 1,500 feet to the south, in the hope of striking this new deposit. Last week at a depth of 100 feet a vein two feet in thickness was passed through. We are informed that to-day, at a depth of 200 feet another vein has been entered. Down the creek about three-quarters of a mile from the hoisting works, croppings of still another vein have been discovered. All this points to the existence of a vast, continuous coal bed.

No satisfactory test of the value of the coal has yet been made. The Douglass mill was run for two months upon it. The grates were wood burners and unsuited to the coal, a ton of which, notwithstanding this disadvantage, proved, according to Mr. Stevenson, the owner of the mill, to be equal to a cord and a quarter of wood. The high price of hauling more than made up the difference in cost, however, and a return to wood was made. At the mine the hoisting works are run with the coal, and the engineer considers it excellent fuel. A scientific test is shortly to be made.

A Narrow Gauge Road to be Built.

When the owners are perfectly satisfied that the extent of the mine will justify the outlay, a narrow gauge railroad will be constructed. The grade of El Dorado canon is well suited for a railroad, being very even, and very little grading would be necessary. It is estimated that a narrow gauge from the mine to Virginia could be built for $200,000. The rolling stock of such a road would be a small item, as the company would not at first aim at other business than transporting their own coal. If desirable, the line can be run through Silver City, engage in bringing wood to the city, and in time branches for the transportation of ore to the mills could be built. The coal could be landed here at $2 per ton first cost, when the railroad was finished.

Economical Consideration.

The vast importance of this coal deposit to the mining interests of Nevada cannot be overestimated. The sources of wood supply are very limited, and are rapidly being exhausted. Mackey, Fair, Flood & O'Brien have secured a supply for ten or a dozen years, but if cheap coal could be dropped at their mines and mills they would naturally much prefer turning their forests into square timber instead of burning the wood for fuel. The supply of Yerington, Bliss & Co. cannot last three years longer, and all the other sources whence wood can be drawn are either too far away or disappearing under the constant drain. The development of this coal deposit will therefore be an unmixed benefit, as no interest will be damaged seriously by the substitution of coal for wood. Were it otherwise the cheaper fuel must force its way. However much opposed mill men and mine owners might be to the change, a ton of coal, equal to a cord and a half of wood in heating capacity and one-half cheaper, would need no stronger arguments.

This great cheapening of fuel must also greatly increase the production of the precious metals, as the low grade ores which will not now pay for the working may then be crushed with profit.

The discovery of this coal mine bears out a principle that most old miners have faith in—that where nature places the precious metals there will always be found the necessary materials to reduce them to a useful state. It is more than probable that within two years coal trains will be running into Virginia City.

THE Consolidated Virginia mine, which paid its usual monthly dividend of $1,080,000 a few days since, yielded during the past month a little in excess of $1,500,000, which, after paying the current expenses and dividend of the month, will still leave a considerable surplus. It is the expectation that the yield for the month of July will not vary but little, if any, from that of June, as the same mills will be employed and about the same amount of ore extracted. All the machinery is in fine order, everything working with the utmost smoothness and perfection. The operations of the new mill especially are without a parallel for the steadiness, amount and perfection of its work.

A New Chlorinizing Furnace.

As there are but few things of more interest or importance to the people of this section than a cheap and rapid chlorinization of base ores, we are impelled to make mention of a new furnace for that purpose, about which we have learned a few facts from J. D. Pringle, late superintendent of the Pacific mining company of this city.

Mr. Pringle left this city several weeks ago for a visit to Colorado Territory, to examine the workings of the Bruckner furnace (recently described in the MINING AND SCIENTIFIC PRESS), with a view to its introduction in the mill of the Blue Jacket mining company, at Blythe City, Elko county, Nevada. He visited the Cariboo mill, at Cariboo, Colorado Territory, which is the property of a Holland company, where he found the furnaces in operation. He showed us a sworn statement of the results of the workings for a period of seven months; but we refrain from giving it to our readers, as Mr. Pringle does not desire to raise expectations too high. Mr. Pringle on seeing the results attained by the furnace, became so impressed with its value as a cheap and complete chlorinizer that he associated himself with James Dawley, a well known former resident of Austin, and together they purchased the right to erect the furnaces in Utah, Arizona, Nevada and California, for which they now hold the exclusive agency. These gentlemen are well known in this section as experienced and reliable mill men, and being thoroughly convinced as to the ability of the furnace, they will give a guarantee in its construction of a product in bullion of ninety-two per cent. of pulp assay, no matter how base are the ores worked.

The capacity of the furnace is six tons, the amount of fuel required to roast the same being but three-fourths of a cord of wood. Mr. Pringle estimates the total cost per ton for roasting the ores of Lander hill by this furnace—including labor, fuel, salt, repairs, etc., at $7, which he says is a high estimate. He will leave here on Sunday for Blythe City, where he will put up two of the furnaces which he ordered while in the East, and when they are at work a practical test of the merits will be had in our own immediate vicinity. It is worthy of mention that the results obtained in the Cariboo—which were far above ninety-two per cent.—were from ores averaging an assay value of $40 per ton, which is far under the value of any ores worked in Austin; and it is a well known fact that the higher the grade of ore, the higher the percentage obtained in chlorinization. If the Bruckner furnace will do what Mr. Pringle claims for it, it is destined to effect a revolution in the reduction of sulphuret ores.—*Reese River Reveille.*

Mineral King.

The Antioch *Ledger* says: George W. Brown, superintendent of the New England tunnel and smelting company, Professor E. G. Moss, assayer and metallurgist, and Russel Eddy, surveyor, left Antioch for Mineral King mines, on Tuesday last. Mr. Eddy goes hence to survey the town site of Beulah, which belongs to the company. Several thousand dollars' worth of the stock has been sold upon the very favorable reports of Prof. Moss and Mr. Brown, and these gentlemen return to further prosecute the work of building mills, furnaces, and developing the mines of the company, with every prospect of success. Letters published in the Visalia papers, as well as private letters to parties here from those now at Mineral, King represent the country as abounding in mineral wealth, with an abundance of water and timber. The location is sixty miles from Visalia. Thirty miles is at present traveled by stage, to Lovely's station, and the remaing thirty on horseback over the mountain trail. The present obstacle to the development of this extensive mineral region is the absence of a graded road over the thirty miles of rough, mountainous country, but should further developments prove the mines to be as rich as is now anticipated, capital will seek investment in so profitable an enterprise as a toll road to this district. A building for an assay office is expected to be completed upon the return of Prof. Moss, which gentleman will shortly thereafter publish a professional report accompanied with assays of the various mines belonging to the New England company. As soon as possible a smelting furnace will be built, and Mr. Brown now expects to continue work during the coming winter. Professor Moss, a candid, intelligent gentleman, informs us that in all his extended travels, and examinations of various mining districts in this State, Nevada and Mexico, he has never before witnessed such an extensive body of well defined ledges, so rich, so accessible, and so conveniently located for working at so small an expense, there being an abundance of wood and water in the heart of the district.

MINING SUIT.—Suit has been brought in the Fifteenth District Court by the Mammoth Consolidated quicksilver company against the Bradford Consolidated quicksilver company, to recover possession of mining ground 27,000 feet in length by 1,000 feet in width, on that certain range of cinnabar heretofore known as the Mammoth claim, and lying in Lake mining district, Lake county.

The daily income of Flood & O'Brien, the mining capitalists of this city, is stated by business associates to exceed $40,000, or $1,300,000 a month.

Useful Information.

Fire Proof Compositions.—A French journal says, that of the score of fire proof composition that have been brought forward within as many years past, there is scarcely one that possesses superior or even equal adaptiou, to the purpose, to the following: Dissolve, in cold water, as much pearlash as it is capable of holding in solution, and wash or daub with it all the boards, wainscoting, timber, etc.; then, diluting the same liquid with a little water, add to it such a portion of fine yellow clay as will make the mixture of the consistence of common paint, and then stir in a small quantity of paper hangers' flour paste to combine both the other substances. Give three coats of this mixture, and, when dry, apply the following composition: Pot into a pot equal quantities of finely pulverized iron filings, brickdust, and ashes, pour over them size or glue water, set the whole near a fire, and, when warm, stir them well together. With this liquid composition, or size, give one coat, and, on its getting dry, give a second coat. It resists fire for five hours, and prevents the wood from ever bursting into flames; that is, it so resists the ravages of fire as, at most, only to be reduced to coals or embers, without spreading the conflagration by additional flames. It is found that a quantity equal to twenty pounds of finely sifted yellow clay, a pound and a half of flour for making the paste, and one pound of pearlash is sufficient to prepare a square rood of deal boards.

An English Invention.—"Priming," or the carrying of water in the steam from the boiler into the cylinder, often causes trouble and damage to the engine. To prevent this, and obtain a dry steam, a dome is fixed to the top of the boiler from which the steam is taken. A recent English invention aids this by fixing an upright pipe next the dome, having suitable connections with it and the bottom of the boiler. In this pipe is secured a circular winged deflector, or propeller-shaped helix. The steam in passing this is given a whirling motion, and the water it holds is thrown out by the centrifugal force, and falls back into the pipe that leads to the bottom of the boiler. A stop-valve prevents its return, and the apparatus is said to be a practical success.

A Cure for Sooty Chimneys.—A contemporary furnishes the following striking evidence of the utility of a well known practice in the construction of chimneys: "About fifteen years ago a dwelling was raised one story higher, and a chimney had also to be raised some feet higher; and as the chimney was built up, it was plastered on the inside with salt mortar, to prevent the adhesion of the soot. The result is that the part plastered with salt mortar is white and clean to this day, while the other part gets filled with soot up to the very line where the salted part begins, and has to be cleaned each year, the chimney being in almost constant use. The proportions used were one peck of salt, added while tempering, to three pecks of mortar."

Apparitine.—A new product called "apparitine," and useful as a glaze or finish for papers and fabrics, and doubtless to be applied in time to many other uses has just been brought out in France. It is made by stirring twenty parts of potato starch into one hundred parts of water, and then adding ten parts of potash or soda lye of twenty-five degrees. The whole is stirred vigorously till the milky mixture becomes transparent, viscous, and stiff. Poured out and dried it gives thin sheets of a colorless, odorless, transparent substance, resembling horn, but more pliable and tenacious. As a stiffening and surfacing material, it is said to possess many valuable properties.

Windows for Dark Rooms.—To light a dark room looking out on a narrow yard or street, let the glass be roughly ground on the outside and set flush with the outer wall. The light from the whole of the visible sky, and from the remotest parts of the opposite wall, will be introduced into the apartment, reflected from the innumerable faces or facets, which the rough grinding has produced. The whole window will appear as if the sky were behind it, and from every point of this luminous surface light will radiate the room. The common window let into the wall takes only the reflection from opposite buildings.

Treating Corks with Paraffine.—Corks saturated with paraffine are used for corking bottles containing alcoholic or caustic liquids. Rusohhanpt prepares them as follows: Paraffice is fused in a suitable vessel, the dry corks are added and immersed in the paraffine by means of a perforated cover or disk. The air is now easily expelled from the pores of the corks, which, after about five minutes, are removed and cooled. They may now be cut and bored like wax, are easily driven into the necks of bottles, and readily removed, retain their smoothness, and are gas-tight throughout.

A New Discovery.—It is worth knowing that if one volume of castor oil be dissolved in two or three volumes of spirits of wine it will render paper transparent, and the spirit rapidly evaporating, the paper in a few minutes becomes fit for use. A drawing in pencil or in India ink can be made, and if the paper is placed in spirits of wine, the oil is dissolved out, restoring the paper to its original condition. This is the discovery of Herr Fischer.

To Remove Mildew.—We have several times been asked for a reliable recipe for the removal of mildew. We doubt whether there is any method that is infallible in all cases; but the following, which we find in an English journal, will often prove effectual: Make a very weak solution of chloride of lime in water (about a heaped-up teaspoonful to a quart of water), strain it carefully, and dip the spot on the garment into it; and if the mildew does not disappear immediately, lay it in the sun for a few minutes, or dip it again into the lime water. The work is effectually and speedily done, and the chloride of lime neither rots the cloth nor removes delicate colors, when sufficiently diluted, and the articles rinsed afterwards in clear water.—*Journal of Chemistry.*

Bag Marking Ink.—A correspondent of the *English Mechanic* gives the following recipe for an ink, the permanency of which he says is perfect, even when bags filled with chemical manures have been in rain and sunshine over ten days: Boil one pound of logwood chips in one gallon of water at boiling point ten minutes, then stir in the eighth of an ounce of bichromate of potash, and boil this ten minutes longer, then add, when cold, one-half pound of common gum, previously dissolved, and stir well in. This will flow well from the pen, and will mark bags with either the stencil plate or block. The cost of the above ink is about 6d. (12 cts.) per gallon.

A Perpetual Paste.—To make perpetual paste—which will remain sweet for a year—dissolve a teaspoonful of alum in a quart of water to which add sufficient flour to make thick cream. Stir in half a teaspoonful of powdered resin and half a dozen cloves, to give a pleasant odor. Have on the fire a teacup of boiling water, pour the flour mixture into it, stirring well at the time. In a few minutes it will be of the consistence of mush. Pour it into an earthen vessel; let it cool; lay a cover on, and put it in a cool place. When needed for use, take out a portion and soften it with warm water.

Eggs in Oxygen Gas.—In dry oxygen gas eggs are uneffected unless punctured. Moist oxygen decomposes the eggs. In moist nitrogen eggs will keep three months. Hydrogen the same. Eggs, whether pierced or whole, were perfectly preserved in carbonic acid, dry or moist. Illuminating gas the same. In chlorine water 1 to 500 eggs kept eight months in a closed vessel. In a solution of dilute chloride of lime, eggs would not keep ten days. Lime-water and sulphate of lime kept them a little longer. Carbolic acid solution 1 to 500 preserved them about six weeks.

Memory in Birds.—A carrier pigeon which was captured in a balloon during the siege of Paris, and sent by Prince Frederick Charles to his mother, recently escaped from captivity and returned to the house of its former owner in the French capital. This is certainly a remarkable instance of the exercise of memory in the lower animals, to which it would appear difficult to find a parallel case. The bird must have kept its former haunts in recollection for nearly five years.

Awnings can be rendered waterproof by plunging the fabric into a solution containing twenty per cent of soap, and afterwards into another solution containing the same percentage of sulphate of copper. Wash and the operation is finished.

Iron may be cemented in wood by dropping in the recess prepared in the latter, a small quantity of a strong solution of sal amoniac. This causes the iron to rust, rendering it very difficult to extract.

Good Health.

Tar in Bronchial Catarrh and Winter Cough.—In a note sent the *British Medical Journal*, Drs. Sidney Ringer and Wm. Murrill state that in the treatment of these complaints they have employed tar in two-grain doses, made into a pill, every three or four hours. From October to January, inclusive, its effects were watched on twenty-five patients, whose age varied from thirty-four to seventy. All these patients had suffered several years from winter cough during the whole winter. Each attack of the paroxysmal and violent cough lasted from two to ten minutes, recurring ten or twelve times in the day and breaking their rest at night. Expectoration was abundant, frothy, and purulent. Breathing was short on exertion, but most could lie down at night without propping. The physical signs showed a variable amount of emphysema, with sonorous and sibilant rhonchus, and occasionally a little bubbling rhonchus at the base. These patients usually began to improve from the fourth to the seventh day; the improvement rapidly increased, and in about three weeks they were well enough to be discharged. The improvement was so decided that even those patients who, in previous years, had been confined to the house during the whole winter, returned to their work. On discontinuing the tar, relapses often occurred in a week or two, but on re-administering the medicine relief was again obtained.

Sun Stroke has become so common in New York that an establishment for the special treatment of such cases is talked of. Sun stroke is something almost unheard of in California.

Mad Dog Bites.

Two months ago a lady was bitten by a dog in East Newark; the next day the husband, in whipping the animal, was bitten on the hand; the dog was killed, the wound healed, and the circumstances were almost forgotten; but a few days since the husband experienced some difficulty in swallowing, soon fell into horrible convulsions and died. The wife is well. As all are exposed to the bites of domestic animals, cat or dog, the mind ought to be informed as to what ought to be done on the spot.

The moment anyone has been bitten or stung, a rag should be thoroughly wetted with spirits of hartshorn and patted on the bitten place for an hour, then bound on, to be repeated for twenty-four hours, for two reasons; the hartshorn creates a smarting, and redness and inflammation, which keeps the blood on the surface, tends, as it were, to keep the poison on the outside, so that it may be washed out. Second, the virus of poisonous bites and stings is an acid; hartshorn is the strongest alkali, and will antagonize an acid in an instant. If no hartshorn is at hand, take the ley of wood ashes, or even make a poultice of fresh wood ashes and water, which make an alkali, let it remain on the wound until some hartshorn can be procured.

A dog ought not to be killed if he has bitten a person, although he may appear to be mad, because such animals, when allowed to become quiet and composed, have often returned to a perfectly natural condition, and thus the mind of the person bitten has been saved from most terrible forebodings.

Medical observation shows that about one person in twenty, bitten by mad dogs, become hydrophobic. In one noted case, a dog bit twenty-one animals and persons, and but one of these became hydrophobic. Not all persons exposed even to smallpox, take it; or to cholera, measles, or any other communicable disease; showing that even dreadful diseases invade only those systems, or states of constitution, which are susceptible to their influence. A London brewer's drayman, who has been swilling several quarts, if not gallons of beer daily, for forty years, is scratched on the hand with a pin, recovers from it, if at all, very slowly, often never; sometimes death follows in a few days from convulsions or mortification. I knew a gentleman of wealth, whose foot slipping as he was stepping into his carriage, the shinbone was thrown against the scraper or step, and he died of mortification of the limb in a few days; because he was a steady hard drinker of whisky, and his system had no power of recuperation or resistance against disease. This principle is proven by the case in hand; the husband died, the wife was unaffected. It is not impossible that if a perfectly healthy man of strong mind was bitten by a mad dog, he would not become hydrophobic; but the precautions named ought to be taken by all, even if the dog or cat be not mad.—*Journal of Health.*

The Treatment of Diarrhœa.—In a paper in Virchow's *Archiv*, Dr. Hertsen observes that diarrhœa of all sorts goes along with an irritable state of the intestinal canal, and any increase of this irritability is to be carefully avoided. He considers that the more usual astringents are, in addition, irritants; and he instances among them the salts of lead, zinc, and bismuth. In all cases, soothing means should first be adopted; and of these, warm applications to the abdomen, in the form of bread poultices, or fomentations, are perhaps the best. The chief medicine recommended is opium, which soothes, but in large doses, interferes with digestion. If the diarrhœa be so violent as to hinder the adoption of opium introduced into the stomach, then morphia should be injected subcutaneously. Of equal importance is the diet. If the person be strong, everything, both solid and fluid, should be withheld; but, where this cannot be done, the food should be of the lightest and simplest. The author especially refers to rice and arrowroot as simple vegetables diets, while any animal food given should be free from fat. Milk should not be too much used, and in any case should be boiled.

A New Mode of Administering Iodine.—An English journal says that the cows on the island of Ushant, off the coast of Brittany, feed principally on sea-weed, and that consequently their milk is particularly rich in iodine; and it is proposed that this milk be used for the cure of diseases benefited by iodine, as it does not produce the constitutional disturbances that often result from the administration of iodine in other forms. Apropos of iodized milk, an Italian physician fifteen years ago, proposed to obtain it by feeding cows on hay that had been sprinkled with a solution of iodide of potassium.

Congestion of the Brain.—A French medical man reports to the Academy a case in which he has succeeded in curing grave congestion of the brain, along with paralysis of the whole right side, by making the patient inhale pure oxygen; from the first inhaletion the patient got relief, and motion and sensibility returned by degrees.

A New Use for the Eucalyptus.—According to a French scientific journal, a captain in the French army, who had always experienced headache, vertigo, and pains in the stomach after smoking, has discovered that by mixing a few dried leaves of *Eucalyptus Globulus* with his tobacco all these effects are prevented.

Domestic Economy.

Something About Soups.

A correspondent sent us some time ago an account of Prof. Blot's manner of making soup. The recent death of Prof. Blot gives it especial interest. He was earnestly engaged in the attempt to teach our people better and more economical use of food than was generally practiced, and his loss is greatly to be regretted.

"*Pot-au-feu.*—Six pounds of fresh beef, (ribs, knuckles, or loin) in a crockery kettle, with five quarts of cold water, salt, and a little pepper on a slow fire. Take off the scum carefully when it rises. Add two white onions with one clove in each, a small parsnip, a carrot, two middle-sized turnips, half a head of celery, two leeks, two sprigs of parsely, one of thyme, a clove of garlic, a bay leaf, and a little caramel to color it. Simmer five or six hours. Dish the meat with the parsnips, turnips, and leeks around it, to be served warm after the soup or kept for the next day. Strain the broth, skim off the fat at the top, put back on a good fire, and at the first boiling, pour on croutons in the soup-dish and serve."

Thus endeth the Professor's recipe. Observe, firstly, that you must use a "crockery kettle"—that is, some good soup-kettle. Many are the husbands who expect as good home-made soup, as they get at first-class restaurants, and many are the discouraged wives who would gladly cook to please their husbands, but who neither of them dream that anything better than a common iron kettle is necessary in which to make nice soup. So, nine times in ten, the soup is more or less flavored with iron. Prof. Blot always says "a crockery kettle" or a "stow-pan," when he mentions the utensil for cooking any dish, meaning the glazed or enameled ware. Marion Harland tells us never to cook onions in an iron kettle. Observe, secondly, that you are to simmer your soup "for five or six hours." To simmer is to boil gently, yet the boiling should not cease for a moment during those five or six hours. Observe, thirdly, that you must skim off all the fat. Many people imagine that the melted tallow gives richness to the soup, but all the cooks agree in saying, "take off all the fat"—and so, I think save every educated stomach.—*Am. Agriculturist.*

How Salt Fish Should be Freshened.—Many persons are in the habit of freshening mackerel or other salt fish, and never dream that there is a right and wrong way to do it. Any person who has seen the process of evaporating going on at the salt works, knows that the salt falls to the bottom. Just so it is in the pan where your mackerel or white fish lies with the skin side down; the salt will fall to the skin and there remain, when if placed with the flesh side down, the salt falls to the bottom of the pan, and the fish comes out freshened as it should be. In the other case it is nearly as salt as when put in.

A Pan Dowdy.—Did you ever hear of a pan dowdy? It is an old-fashioned New England dish and has a flavor of our grandmother's cookery. Make a rich crust, line a deep earthen pot with it; now slice some pie apples quite thin for the first layer; strew the apples with molasses and spice and a teaspoonful of milk; cover with a thin crust and repeat the process. Cover the top with crust and your pan dowdy is made. Bake it in a slow oven. A brick one is made use of in New England generally. When done, turn it on a platter and serve hot.

Currant Jelly.—A correspondent of the Germantown *Telegraph* writes: I have seen two or three recipes in the *Telegraph* for making currant jelly, but I like none of them so well as the following, which will give a perfectly transparent article and will satisfy every housekeeper, who will prefer it to all others or I'm mistaken: Scald the currants, then press, strain and measure them. Put the juice on to boil ten minutes; pour it while boiling over the sugar, allowing a pound to every pint of juice.

Breakfast Muffins.—Housekeepers will value this recipe as a dainty substitute for bread at breakfast or tea: Two eggs well beaten with a cupful of sugar, and a lump of butter the size of an egg; to this add one pint of milk, with a teaspoonful of soda, one quart of flour, and two tablespoonfuls of cream tartar; bake in muffin rings on top of the range, or in gem pans in a quick oven.

Muffins.—One quart of milk, five eggs, one tablespoonful of good yeast—if home made, three or four; a lump of butter the size of a walnut, and sufficient flour to form a stiff batter. Set in a warm place to rise, and when light bake in muffin rings.

Green Corn Griddle Cakes.—Make a batter of three eggs, a pint of flour, a little salt and water, or milk if you have it. Grate the corn from six ears into this mixture and bake on griddles. Serve hot with butter. Canned corn may be used in winter.

Mush Waffles.—One quart of flour, one pint of corn meal mush, two eggs, a tablespoonful of butter and a little salt. Make a thin batter with sweet milk. Separate the eggs as for rice waffles; it makes them lighter.

MINING AND SCIENTIFIC PRESS.

W. B. EWER.....SENIOR EDITOR.

DEWEY & CO., Publishers.

A. T. DEWEY, GEO. H. STRONG
W. B. EWER, JNO. L. BOONE

Office, No. 224 Sansome St., S. E. Corner of California St., San Francisco.

TABLE OF CONTENTS.

GENERAL EDITORIALS.—A New Concentrator; Academy of Sciences; Italian Mountain; Working Ores Dry, 49. General News Items, 53. Saving Salt in Chloridizing Silver Ores; The Editorial Excursionists; Perfection of Modern Workmanship; Depression in the Iron Business; Trouble in the Black Hills, 56. Notices of Recent Patents; Cotton Manufactures; Leaf Cutters; Australian Awards to California Exhibitors, 57. Patents and Inventions, 61.

ILLUSTRATIONS.—Frue's Improved Concentrator; Italian Mountain, 49. The Leaf Cutter, 57.

CORRESPONDENCE.—Hydraulic Gold Mining, 50.

SCIENTIFIC PROGRESS.—The Motive Power of Light; Combustion and Decay; A New Use for May Buge; Another Ancient City to be Uncovered; The New Discovery in Light; Curious Effects Produced by Lightning; Aphorisms from the Metallurgy of Iron; Powder Mill Explosions; A New Idea in Telegraphy, 51.

MECHANICAL PROGRESS.—The Burning of Wet Fuel; Iron Manufacture; Wrought Iron Philosophically Considered; Ericsson's Solar Engine; The Most Powerful Gun Yet, 51.

MINING SUMMARY from the various counties in California, Nevada, Idaho, Arizona and Oregon, 52-53.

USEFUL INFORMATION.—Fire Proof Compositions; An English Invention; A Cure for Sooty Chimneys; Apparitine; Windows for Dark Rooms; Treating Corks with Paraffine; A New Discovery; To Remove Mildew; Bag Marking Ink; A Perpetual Paste; Eggs in Oxygen Gas; Memory in Birds, 55.

GOOD HEALTH.—Tar in Bronchial Catarrh and Winter Cough; Mad Dog Bites; The Treatment of Diarrhœa; A New Mode of Administering Iodine; Congestion of the Brain; A New Use for the Eucalyptus, 55.

DOMESTIC ECONOMY.—Something About Soups; How Salt Fish Should be Freshened; A Pan Dowdy; Currant Jelly; Breakfast Muffins; Green Corn Griddle Cakes; Mush Waffles, 55.

MINING STOCK MARKET.—Sales at the San Francisco Stock Board; Notices of Assessments; Meetings and Dividends; Review of the Stock Market for the Week, 60.

MISCELLANEOUS.—The Work of Children in French Mines; Water for Hoisting; Hardening Small Tools, 50. Progress at the Sutro Tunnel; Industrial Items, 53. Grass Valley Mines; Coal for the Comstock; A New Chlorinizing Furnace; Mineral King; Mining Suit, 54.

UTILIZATION OF WATER POWER.—Mr. M. F. Bramwell in his late annual address to the Institution of Mechanical Engineers, said: "Do we, in our application of power, make as much use of wind, water and waves as we ought, remembering that their power may be transmitted to a distance? Do we resort, to any large extent, to sources of power in nature other than coal? Is it not the fact that mechanical invention has gone back in these matters rather than forward? And do we utilize that primary source of power, the heat of the sun, the current heat from year to year, making the most barren hillsides valuable, as it seems to me we might do, by planting quick growing trees, which, fostered and matured by the sun, would yield large quantities of wood to be used as fuel for domestic purposes? Are we estimating at their full value the deposits of peat, and are we not tempted to pass by this large store of fuel because its use is attended with difficulties? Is it not true that we use coal in the most grossly wasteful manner? How much of the fuel goes up the chimneys of our furnaces unconsumed, in the form of visible carbon, or in the worse, because less readily detected, form of invisible carbonic oxide?" In the face of such faults and errors, Mr. Bramwell argues that it is the duty of mechanical engineers, "by precept, practice and example, to do all that lies in their power to cause all to respect and understand the value of that which they have too long lightly treated and grossly abused."

CHINESE INVESTIGATIONS.—A Chinese Commissioner is now inspecting the coal fields of Great Britain. He has been sent out by his government to obtain information on the machinery used in raising coal, and the method generally of working collieries, with a view of applying his knowledge to the working and opening out of new collieries by the Chinese Government.

AT the Buckeye mine, on the Comstock, preparations are being made to shut down the mine for a short time until the new machinery can be placed in position ready to start up.

THE Salmon Falls (N. H.,) manufacturing company have closed their mill No. 2 for five months.

Saving Salt in Chloridizing Silver Ores.

In chloridizing silver ores, where furnace chloridization is resorted to, a large portion of the salt (chloride of sodium) which escapes decomposition in the furnace, and certain soluble chlorides which are formed in the furnace, may be recovered and used for chloridizing fresh ores, by evaporating the liquors from the stirrers in amalgamating works which are usually allowed to run to waste. In Stewart's mill in Colorado, it was found that 26,258 gallons of liquors were run off daily from the settlers, which had a specific gravity of 12° Banme, and contained per gallon 6,072 grains of soluble chlorides. There were thus lost 2,263 pounds of chlorides, chiefly chlorides of sodium and zinc, (which was found as suitable a chloridizer as pure salt), whose recovery would reduce the consumption of salt more than one-half.

A method of saving this salt has been patented by James Douglas, Jr. As ordinarily conducted, the process of chloridizing silver ores consists in roasting the sulphurous, antimonial and other compounds of silver and associated metals with common salt. The result of this roasting is that the silver, and most of the other metals connected with it, are converted, in whole or part, into chlorides, some of which chlorides are soluble in water, others not. The ore thus chloridized in the furnaces is then agitated with mercury and water in pans or barrels, by which means an amalgam of silver, gold and certain of the base metals in the ore is formed, and the chlorides soluble in water are dissolved. The water containing these chlorides in solution is at present allowed to run to waste; but from these liquors, holding as they do in solution these soluble chlorides, which may consist, besides the chlorides of zinc and other base metals, of a variable quantity of chloride of sodium which escaped decomposition in the roasting furnace, Mr. Douglas proposes to recover the salts, and to use them for the purpose of chloridizing fresh ore. This may be done either by evaporating said liquors to dryness, or, in certain cases, only until some of the chlorides have crystallized out. After the amalgamation has been effected, both the pulp and the liquor in which it is suspended, and which contain the chlorides to be recovered, may be received in sluice pits, where the insoluble matter must be allowed to settle, and whence the supernatant liquors must be drawn off to be evaporated by the waste heat of the furnace or otherwise.

The evaporating pans, if waste furnace heat be used, may be built into the floor of the furnace flue, which must be provided with doors at suitable distances, or they may be made to form the roof of the flue. The chloride of sodium and of other metals which will gather in the evaporating pans, will serve to chloridize fresh ore, and will thus economize the consumption of salt, or of any other chloride which might be used.

There may be cases in which it is desirable to crystallize out a part only of the salts in solution in the waste liquors; as, for instance, when copper is present in the furnace charge, which it is desirable to save. In such cases, if the chloride of iron bath, employed in the Hunt & Douglas patent copper process, be used to extract the copper, the evaporation must be carried to such a point that the chloride of iron shall remain in solution in the mother liquors. The solubility of chloride of iron is such that it will remain in solution when the other chlorides present shall have almost entirely crystallized out.

The Editorial Excursionists.

The excursion party arrived in San Francisco on Friday, the 16th, according to their first announcement. Good health, cheerfulness and general satisfaction prevail throughout. On Monday the editorial rooms of the PRESS were visited by Henry T. Williams, editor of the *Horticulturist* and general manager of the excursion, X. A. Willard, of the *Rural New Yorker*, Clark W. Bryan, editor and proprietor of the *Union*, Springfield, Massachusetts, B. K. Bliss, the well known seedsman of New York, with several others. Of course we had a very pleasant chat.

After leaving our office the party took a ride to the Cliff House, and in the afternoon, accompanied by the PRESS staff, visited Woodward's Gardens by invitation of the public spirited and hospitable proprietor. Extreme gratification was expressed at the exhibition there. The aquarium especially was declared to be superior to that of any Eastern city.

The rest of the week was mostly taken up with visits to Mr. Woodward's place at Oak Knoll, Napa Co., the Geysers, Vallejo, Benicia, Martinez and Mt. Diablo.

On Monday, the 26th, the party, accompanied by friends from this city and vicinity, will visit the State University, where a pleasant occasion is anticipated.

In fact, any affair could scarcely fail to be pleasant in which these cheerful, intelligent excursionists participate. In justice to our editorial guests we must say that they have not failed to bring with them the good nature and willingness to be pleased, without which the best efforts at hospitality on the part of the host are of little avail.

For ourselves we can say that besides the demands of common courtesy, which alone would induce us to strive to make this excursion in every way satisfactory to the party, we have found among them some old and highly esteemed acquaintances and have formed some pleasant new ones.

The ladies in the party seem particularly well pleased with California and all contained therein, and are quite at home here.

Perfection of Modern Workmanship.

The precision with which the modern mechanic is able to work is one of the marvels of the age. This approach to perfection is not, however, so much due to increased skill in manipulation, as to improved mechanical devices, by which the machine is made to do much that has heretofore depended upon the uncertain movements of the hand. Machine work is far more generally employed in American shops, and also carried to a much greater degree of perfection by American mechanics than by those of any other nation. A necessity brought about by the multiplicity and originality of our inventions has led to important steps in mechanical progress. The Colt's pistol and rifle, the sewing machine, the American watch and many other minor articles could never have reached their present status, unless a great progress had been made in the more extended application of machine work. The lack of such appliances is the reason why the revolver and sewing machine cannot be successfully manufactured in Europe, except as is done to a limited extent under the direction of American mechanics. The lack of such appliances is the reason why the dear labor of American workmen can successfully compete with the cheap labor of Switzerland in the manufacture of watches. The revolver, the sewing machine and the watch are made in this country on the plan technically known as "assembling"—that is, every piece of any of these articles is so accurately made that it will fit in its place in any other one of its kind or class. Such a principle cannot be applied to hand-made parts for any delicate piece of machinery.

Of course the manufacture of the tools by which such parts are made requires great accuracy of construction, and leads to most careful manipulation; and in this perhaps the English mechanic exceeds all others. Their more habitual dependence upon the hand and eye in all their finishing processes also leads the Englishman to greater skill in this direction.

An interesting and suggestive lecture was lately given by Dr. Tyndall, before the British Royal Institution, on the "Whitworth Planes, Standard Measures and Guns," in which the perfection of modern workmanship was most strikingly illustrated. The lecturer stated that Mr. Whitworth, in perfecting his machine kept steadily in view the utmost reach of mechanical veracity. His starting point was to obtain a true plane, which should serve as a *datum* line by which all untruthful work might be detected, extent of error examined and fault corrected. His success in this effort is perhaps the most marvelous instance of mechanical perfection which has ever been accomplished. He prepared two plane surfaces so absolutely true and smooth that when placed in contact considerable force was required to separate them. This adhesion was for a long time thought to be due to the exclusion of air from between their inner surfaces, and the consequent weight of the atmosphere pressing upon the outside.

Dr. Tyndall was led to doubt the correctness of the maker's theory and ventured the assertion that the marvelous perfection of the workmanship was such as to admit of the actual cohesion of the surfaces by molecular attraction! To test his theory he placed in contact two of Whitworth's planes, weighing about three pounds each, and hung them up under a glass receiver from which he exhausted the air. After obtaining as complete a vacuum as is practicable by the most perfect pump, he had the gratification of seeing that the under plane still adhered to the upper surface—thus fully proving his theory, and demonstrating the wonderful degree of mechanical perfection to which Mr. Whitworth had arrived. The experiment was afterwards repeated with the same success with a twelve pound weight attached to the lower plate!

This experiment was also performed in presence of his audience. The lecturer further explained to his hearers the construction of two measuring machines, one of which was capable of measuring and recording the one ten-thousandth part of an inch, while the other was equally effectual in determining the one-millionth part!

Several other wonderful instances of mechanical perfection were also alluded to, and the lecturer closed his remarks by paying a merited tribute to the talent and genius of Sir Joseph Whitworth, who had done so much, not only to advance the practical mechanical appliances of the age, but who had also reached out so far in advance of all others toward absolute perfection in mechanical skill.

Depression in the Iron Business.

There is at this time a very general depression in the iron business throughout Europe. The production of pig iron in Scotland during the year 1874 was less than it has been for any one of the previous twenty years. At one time there were only thirty-two furnaces in blast, out of 132 which were in existence.

In Prussia, the large steel works of Krupp have discharged about 1,000 workmen; while the Borsig manufactory of engines at Berlin—the most extensive in the country—has also been obliged to protect itself by a large dismissal of its workmen.

In Austria, Sigel's locomotive engine factory—the largest in that country—endeavored for a while to sustain itself by reducing its number of employees. About 2,000 hands were discharged, but still the orders for work were insufficient to warrant the continuance of even the small force of hands remaining, and we now hear that this establishment is to be entirely closed. Another report is that this establishment is to be closed on account of the lack of working capital; that Herr Sigel has orders for 400 locomotives for the Russian government, but that he cannot obtain the two million dollars needed for carrying out this large order. It is further said that earnest efforts are being made to have the Austrian government step in and render the needed pecuniary assistance, in order to prevent the suffering and destitution which would follow the entire closing up of these works.

In England, while we do not hear of any very extensive closing outs, there is nevertheless a very great stagnation in this branch of industry.

In the Atlantic States of our own country, a similar condition of things exists as is noted in England; so that we at least have the poor consolation of knowing that we are not alone in our misery.

California, however, may be made an exception in this regard; for our iron foundries and machine shops were never, at any former period, so busily engaged as at the present time. There is also good prospects of a still more prosperous future, for at least a year to come.

Trouble in the Black Hills.

The telegraph informs us that General Crook has ordered the release of all the captured Black Hills miners, upon their giving parole. There seems to be, however, still more trouble ahead in the Black Hills country. A letter to the Omaha *Herald*, written by its correspondent who accompanied the Commissioners sent out to treat with the Indians for the Black Hills, is to the effect that the treaty has been seriously affected by an unfortunate collision between a party of Indians and the soldiers. Great excitement prevails at the agencies. The affair, as derived from Indian sources, is as follows: Several weeks ago a horse stealing expedition, called a war party, numbering about 200 Indians, was organized by the wild-cat young bucks of the Red Cloud and Spotted Tail agencies, to go against the Poncas. They had a fight with the Poncas, stole some horses, when they encountered a party of forty soldiers from Fort Randall, at Little White river crossing, 132 miles from the Spotted Tail agency. The Indians were asked for a pass, showing their right to leave their reservations, which they could not produce, and they were informed the troops had orders to shoot any Indians off their reservations without permission. The Indians said: "We are agency men; don't want any trouble with white men," and seeing a piece of timber they ran for it, and the soldiers opened fire, killing two and wounding three. A brother of Tall Lance, who was one of the delegation to Washington recently, was among the killed. Tall Lance exhibits much grief over his brother's death. Spotted Tail has sent word to the Commissioner that there could be no treaty until the murder of his men could be explained; he at the same time advised his men to be calm and patient until the facts are learned. This outbreak, in connection with hundreds of adventurers overrunning the Indian country, may result in an outbreak at any moment. Miners who come in contact with Indians are resolute. Colonel Mills, commanding at Camp Sheridan, reports that a few days ago a party of Indian hunters came upon some miners, and at once received a volley. Luckily nobody was hurt. The Indians asked Colonel Mills to permit them to go and capture the miners. Colonel Mills told them they could not, and they replied that they could not understand why the Government burned miners' outfits and would not permit Indians to do so.

ARTISTIC IMPROVEMENTS.—Manufacturers of all kinds exhibit a decided improvement in the artistic decoration of goods produced, whether they be stoves, machinery, furniture, tools or carriages. Hereafter it may be laid down as a rule that the most highly finished and most beautiful goods in every trade will command the best market and the highest price, and that, other things being equal, the measure of their artistic value will be the measure of their commercial value.

Notices of Recent Patents.

Among the patents recently obtained through Dewey & Co.'s Scientific Press American and Foreign Patent Agency, the following are worthy of mention:

Door Bolt Attachment.—Louis Monks, San Francisco. This improvement consists in providing an ordinary bolt with a plate attachment, which will serve as a means of attaching the bolt to the door either in a temporary or permanent manner as desired The plate is attached to the end of the base plate of the bolt, which will stand at right angles to the bolt. On the inside of the plate the inventor forms one or more projections or spurs. The plate attachment can then be placed against the edge of the door frame, and the door closed upon it, so as to force the spurs into the wood of the frame and secure the bolt in position against the outer face of the door frame in the manner of using a temporary door fastener. The bolt can be shut across so as to fasten the door in the usual manner. This door bolt will be especially useful for travelers who are compelled frequently to sleep in rooms having defective door fastenings, as it can be applied in an instant, and will provide a perfectly secure fastening. Screw holes can be made through the plate and the plate screwed firmly against the edge of the door frame after the spurs have been embedded in the wood, when it is desired to employ the bolt as a permanent fastening.

Governor.—Frank M. Merrill, Marysville, Yuba county, Cal. This invention is a novel governor, which is to be employed for steam engines, water wheels, or any other machinery to which it may be necessary to impart a steady motion. The improvement consists in the employment of a pair of governor balls or weights which are caused to act upon the stem of a valve, admitting a liquid to one end or the other of a cylinder within which moves a piston. The rod of this piston connects directly with the supply valve or gate of the machine to be controlled, and thus opens or closes it as may be necessary.

Harvester Fingers.—Victor N. Collins, Nordhoff, Ventura county, Cal. This invention relates to certain novelties in harvester fingers and their relation to the finger bars, and it is an improvement on a patent granted to the same inventor, January 27th, 1874. The improvement consists in making the guard a finger so that the cover for the draper is formed in one piece with it instead of being formed separately and secured to the finger bar or formed in one piece with the latter. The keepers for the sickle may also be formed in one piece with the guard, the whole being constructed of cast metal of any kind. This construction cheapens the device and saves considerable work upon the top of the finger bar.

Windmill.—Joseph McGovern, Modesto, Stanislaus Co., Cal. This improvement is especially intended to make the mill self governing, and consists in the construction of a vertically placed vane, with two other horizontally placed vanes, one of which ordinarily holds the wheel to the wind. Any dangerous increase in the wind will act upon the vertical vane, and this by its connections will so turn the other vanes as to throw the mill more or less out of the wind. As the strength of the wind varies, the mill will regulate itself to its necessities.

Folding Table.—E. J. Marstens, Stockton, Cal. This is an improvement in that class of tables which are intended to be folded into a small compass for the purpose of transportation, and it consists in a novel manner of constructing what the inventor terms compound legs, which will by this method of bracing form a very stiff and serviceable table. These legs may be folded down upon the table and the table itself divided into two leaves, which may be turned back to back for transportation.

Connecticut Ahead.—By a telegram from Hartford, Conn., July 19th, we learn that the House of Representatives on that day passed a resolution previously passed in the Senate, establishing the first agricultural experiment station in America. The plan is to appropriate $700 quarterly to the Wesleyan University of Middletown, the money to be used in testing fertilizers and performing in the extensive laboratories of the institution those experiments so beneficial to agriculture which are successful in Germany and other parts of Europe. It is understood Prof. Atwater, in charge of the chemical department at the College, is the best agricultural chemist in the country, and as the appliances are first-rate, there is no doubt that the first agricultural experiment station in the United States will be a success. Hundreds of petitions have been presented in the Legislature asking for its establishment.

Cassiar Mines.—The news from the Cassiar mines is very encouraging; all hands are taking out big pay. The Grant company's claim was sold to some Chinese for $2,500. The prospects are much better than during the last year.

Cotton Manufactures.

This important branch of textile fabrics had its origin in India and China, the inhabitants of which have practiced the art for unknown centuries. Among ancient writers Herodotus was the first to mention this staple, which he called *tree-wool*. Cotton fabrics were imported from India in small quantities by the ancient Greeks and Romans. Spain was the first country to introduce the manufacture of the fabric into Europe, at about the 10th century. Italy and the Netherlands soon followed, but nothing was done by England in this direction until 1640. The entire annual value of the English manufactures of cotton in 1760 amounted to only one million of dollars, but a new impetus was given to the business in 1767 by the invention of the spinning-jenny by Hargraves.

The idea of printing cotton fabrics also had its origin among the Chinese. This class of goods was first introduced into England through the medium of the East India company.

THE LEAF CUTTER.

Printed cottons were first employed for window draperies and chair covers, and it is said that many an old country mansion in England has rooms still hung with these goods, the colors slightly faded by age and sunlight, but almost entirely undisturbed by periodical washings.

As the cotton manufacture developed itself in Lancashire, it became evident that a profitable trade might be established by an imitation of the Chinese printed goods, also. Accordingly print works were established, at first on a small scale, but which rapidly grew into mammoth proportions. The earlier designs were merely copies of the uncouth trees, figures, vases, birds, etc., of Chinese art. As the business began to grow a new and more English style of goods were turned out, but consisting mostly of large and showy flowers, leaves, fruits, etc., barbarous in taste, but printed in genuine fast colors capable of enduring any number of visits to the wash tub. As time passed and taste improved, the more neat and delicate modern styles were introduced, upon which improvements in style and quality have been made, until cotton goods have been brought to the beauty and excellence in which we now find them.

Carson Mint.—The following is a statement of the business of the United States Mint at Carson during June, 1875: Coinage executed, $318,993 06. The deposits were as follows: Gold, 4,100,794 ounces; value, $76,294. Silver 79,040,980 ounces; value, $91,447.47.

Leaf Cutters.

These bees are smaller than our domestic kinds, are black, with red hairs on the throat, and a white down upon the head and abdomen. They build their nests in the ground. In the engraving, a portion of earth is removed, revealing a section of two nests. It will be seen that they commence by boring down, almost perpendicularly for some inches, to form an entrance, which is enlarged into a horizontal tube or gallery. The leaves of the rose bush are always used to form the nest. The most perfect leaf is selected, and the insect, alighting upon it, cuts a piece with its mandibles, with which it flies to the nest. Ten or twelve pieces of different sizes and shapes are thus conveyed to the bottom of the excavation, where they are twisted together so that one piece folds within another, forming a kind of funnel-shaped cone. The pieces of leaves are fitted together as perfectly as though done by an expert, and retain their position. The little architect then makes a cake of honey and pollen, places it inside, lays an egg, and then proceeds to wall up the nest. A circular piece is cut out of a rose leaf again, which just fits the opening. This is pushed down till it closes the opening of the cone-shaped nest. A second and third leaf is added, and sometimes a fourth. In this manner a series of cells is constructed in one excavation, sometimes amounting to eight or ten, and when all is completed, the hole is closed up so nicely that no trace of it is left.

The different species of solitary and nest-making bees have their mandibles constructed to suit their habits; the carpenter bee to bore through wood, the mason bee to work in cement and the leaf cutter to dig in the earth.

Getting Ahead of a Railroad.—The Columbia Conduit company were recently desirous of laying a pipe for the conveyance of oil under the track of a railroad which runs a distance of about nine miles at the Allegheny river from Power's run, Pennsylvania. The company refused the privilege, thinking to secure the transportation for the road. The oil company, however, have constructed a number of tank wagons with axles and wheels which will run on the track, and they now do their transportation by rail free of toll. Their tanks hold about twenty-five barrels each and can be loaded or unloaded in two or three minutes by merely making a suitable connection and turning a faucet. This move of the conduit company demonstrates anew that "where there's a will there's a way."

Australian Awards to California Exhibitors.

The premiums awarded to California exhibitors at the late exhibition of the Agricultural Society of New South Wales arrived by the last Australian steamer. They consist of bronze and silver medals, about three inches in diameter, and weighing about seven ounces each. They have been awarded as follows: Silver medals were awarded to W. T. Garrett & Co., for brass goods; to Linforth, Kellogg & Co., for agricultural implements, and to Kimball manufacturing company for carriges. Bronze medals were awarded to Leisenfield & Co., for billiard tables; Consolidated tobacco company, for tobacco; E. K. Howee & Co., for wooden ware; Main & Winchester, for saddlery; C. C. Burr & Co., for spices; L. Lachman & Co., for wines; J. S. Barker & Co., for locks and store fittings; Edgerton, Allen & Co., for starch; Pacific saw manufacturing company, for saws, files, etc.; Geo. W. Clarke & Co., for paper hangings; Brittan, Holbrook & Co., for stoves; Littlefield, Webb & Co., for produce; Painter & Co., for type; Snow & May, for paintings; I. Landsberger, for wines; Cutting & Co., for preserves; Geo. A. Raymond, for safes; C. E. Watkins, for photographs; Kohler & Frohling, for wines. A. S. Hallidie was presented with a handsome gold medal as a recognition of the services he rendered in aiding the success of the exhibition.

As an evidence of the large benefits which must accrue to California for the interest she took in the exhibition, we may mention that in addition to the sale of goods taken down, orders for additional goods were received here several weeks ago, to the extent of $60,000 in value, while the last steamer brought an additional order for $40,000 more.

The face of the medals awarded has a neat design, representing industry, with the inscription, "Science with Practice." On the reverse appears a wreath surrounding the name of the society and the person to whom it was awarded.

Blasting Memoranda.

The following table gives the space occupied by any given quantity of powder in round holes of different sizes, from one to six inches diameter:

Diameter of the hole.	Powder contained in a 1 inch hole.	Powder contained in a 1 foot hole.	Depth of hole to contain 1 lb powder.
	oz.	lb. oz.	Inches.
One	0.1	5.0	38.19
One and one-half	0.9	11.3	17.98
Two	1.7	4.1	9.55
Two and one-half	2.6	15.4	6.11
Three	3.8	13.2	4.24
Three and one-half	5.1	13.6	3.12
Four	6.7	0.4	2.39
Four and one-half	8.5	5.8	1.89
Five	10.5	13.7	1.53

The rules for calculating the amount of powder for a given weight is that "the charges are proportional to the cubes of the lines of least resistance," that is, if from experiment we find that in a certain rock four ounces of powder is sufficient to blow out a hole where the depth of the line of least resistance from the bottom of the hole to the surface is two feet, then for one where this depth is eight feet the charge would bear the same proportion to four ounces as 2.3 does to 8.3, that is sixty-four times; it would consequently be sixteen pounds. The following table is calculated in this manner, and is for the case of moderately hard rock, such as certain kinds of limestone:

Line of least resistance.	Charge of powder. lb.	oz.
One foot	..	.00½
One and one half feet	..	1.70
Two feet	..	4.00
Two and one-half feet	..	6.25
Three feet	..	7.90
Three and one-half feet	1	5.00
Four feet	2	.00
Four and one-half feet	2	.90
Five feet	3	.15
Six feet	6	.12
Seven feet	10	.12
Eight feet	16	.00

Needed Inventions.

The *Sewing Machine Journal* gives the following list of inventions in which great improvements can be made. There is great need, it says, of these specified, and also great room for advancement. Doubtless a fortune can be made on them if properly managed:

1. A ruffler which can be set to gather a given fulness.
2. A simple embroiderer.
3. An adjustable scroll binder which will not stretch the binding.
4. A practical adjustable hemmer, from the smallest size to an inch wide.
5. A rotary shuttle sewing machine, which will not twist or untwist the thread, and which will sew with great rapidity.
6. A practical tuck folder.
7. A sewing machine which will have in its working parts the different attachments which can be thrown in gear with some working part of the machine when the attachment is required.
8. Motive power.
9. A good needle threader.
10. A close oil bottle which can be sold cheap, and used to oil the machine instead of the oil can. It must be made so that the oil can be forced out.

Banking.

The Merchants' Exchange Bank

OF SAN FRANCISCO.

Capital, Five Million Dollars.

C. W. KELLOGG.....President.
H. F. HASTINGS.....Manager.
B. N. VAN BBUNT.....Cashier.

BANKING HOUSE,
No. 423 California street San Francisco.

KOUNTZE BROTHERS, BANKERS,

12 WALL STREET, NEW YORK,

Allow interest at the rate of Four per cent. upon daily balances of Gold and Currency.

Bankers and Brokers, 72 Broadway, New York.

Averill Chemical Paint,

MANUFACTURED BY THE

Cal. Chemical Paint Co.

PURE WHITE, AND ANY SHADE OR COLOR.

This Paint is prepared in liquid form, READY FOR APPLICATION—requiring no thinner or dryer, and will not spoil by standing any length of time.
It is Cheaper, more durable, more Elastic, and produces a more Beautiful Finish than the best of any other Paint.
It will not Fade, Chalk, Crack, or Peel off, and will last twice as long as any other Paint.
In ordering White, state whether for Outside or Inside use, as we manufacture an Inside White (Flat) for inside use, which will not turn yellow, and produces a finish superior to any other White known.
Put up in ¼, ½, 1, 2 and 5 gallon packages, and in Barrels. Sold by the Gallon.
For further information send for Sample Card and Price List, or apply to the office.

OFFICE and DEPOT: 117 Pine Street, near Front.
FACTORY: Cor. 4th & Townsend Sts.

LEVI, STRAUSS & CO.,

Patent Riveted
Clothing,
14 & 16 Battery St.,
San Francisco.

These goods are specially adapted for the use of FARMERS, MECHANICS, MINERS, and WORKING MEN in general. They are manufactured of the Best Material, and in a Superior Manner. A trial will convince everybody of this fact.

Patented May 12, 1873.
USE NO OTHER, AND INQUIRE FOR THESE GOODS ONLY. eow-bp

14 GMG OZ.
STEARIC ACID
CANDLES
GEO. M. GRANT & CO.
PHILADELPHIA.

The Candles sold under the above well known brand" are made only of Pure Stearic Acid, twice hydraulic pressed, are not cheapened by adulteration with crude material, and upon burning, give a large and brilliant flame, without running. 13v9-2ambp

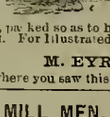
AMMONIA!

For Washing and Cleaning Purposes.

For Sale by all Grocers.

This article is universally used in Europe, and, recently introduced for general family use in San Francisco and neighborhood, is already in great demand. It is now the intention of the manufacturers to introduce it all over the Pacific Coast, at prices which will bring it within the reach of every household.
It is unequalled for cleansing Woolen Fabrics, Cutlery, Carpets or Crockery; for Scrubbing Floors, Washing Paint, Removing Grease Spots, Shampooing or Bathing.
It renders water soft, and imparts a delightful sense of coolness after washing.
DIRECTIONS.—For Laundry, use two to four tablespoonfuls to a washtub of water. For bathing, use one tablespoonful in the bath tub. For removing grease spots, apply with a brush, undiluted, and wash with water afterward. For stimulating the growth of plants, use a few drops in every pint of water used in watering.
PRICE.—Per Pint Bottle, 25 cents; per quart Quart Bottle, 40 cents; per Half Gallon, 75 cents.
Also, SULPHATE OF AMMONIA for chemical purpose, fertilizing, and the preparation of artificial manures. AMMONIACAL PREPARATION for the prevention and removal of boiler scale. CRUDE AMMONIA, for general manufacturing. and PUR LIQUOR and AQUA AMMONIA for chemical and pharmaceutical purposes.
☞ Manufactured by the
SAN FRANCISCO GAS-LIGHT CO.
eowhp

Bronze Turkeys
Gobblers, 30 to 40 pounds. Hens 15 to 20 pounds.



Emden Geese

[Please state where you saw this advertisment.]

MILL MEN.

Wanted, by a thoroughly practical mill man, a situation as First Engineer, Foreman, or General Manager. Is an engineer and machinist by trade, and has a fair knowledge of assaying, melting, etc. Apply to A. M. KRUTTSCHNITT,
North C and Mill streets, Virginia City, Nevada.

THE TURBINE.

Simplest, Cheapest, and Most Durable.

The Inventor of the Dexter Windmill has made new and useful improvements in Windmills, patented March 16th, 1875, and now feels confident of having the SIMPLEST, CHEAPEST, MOST DURABLE, and

ONLY PERMANENT WINDMILL
IN THE WORLD.

SIMPLEST, because it is less complicated; CHEAPEST, because it never needs repair, standing on a firm foundation; MOST DURABLE, because it is all under cover, and has less rigging to get out of order; ONLY PERMANENT, because the only Windmill in the world that has never been injured by storms. Hundreds of people, who have thought the Dexter perfect, will be glad to observe the SUPERIORITY OF THE TURBINE over all predecessors. Although much improved, the price of mills remain the same as formerly. Persons who study their own interest will investigate the TURBINE before purchasing any other.
Territory for sale outside of California, at reasonable rates and easy terms.
Mills built to order of the best material, and at the shortest notice, by Kimball Manufacturing Company, corner Fourth and Bryant streets, San Francisco. Any orders sent to their address will receive prompt attention.
☞ For further information regarding Mills or Territory, send for New Circular. Address,
A. H. SOUTHWICK,
P. O. Box 1385, San Francisco; or
P. O. Box 25, Oakland, Cal.

WATER TANKS of any capacity, made entirely by machinery. Material the best in use; construction not excelled. Attention, dispatch, satisfaction. Cost less than elsewhere.
WELLS, RUSSELL & CO.,
Mechanics' Mills, Cor. Mission & Fremont Streets.
3v28-3m-sa

To Miners and Capitalists.

FOR SALE OR LEASE!

A very rich gravel and cement gold mine in Placer County, 250 acres in extent. For full particulars,
Address J. L. COAN,
233 Third street,
Or call at 412 Market street.

EXPLOSIVE COMPOUND.

PATENT FOR SALE.

This Explosive Compound, perfectly safe, is equal in strength to giant powder. Cost of material, only 11 to 20 cents per pound, for blasting purposes, torpedoes, shells, cannons, etc.—government use generally. It is particularly adapted for general blasting, like common black powder. Patent right for sale, either for county, State, or the whole of America. Best of references given for its practical use. Further information and the address of the inventor can be had at this office.

Ames' Genuine Chester Emery

A Has been reduced from seven cents to six cents per pound for grains in kegs, flour and fine flour remaining at four cents per pound, as heretofore. Important discounts to the trade. Send for circulars.
E. V. HAUGHWOUT & CO.,
26 Beekman Street, New York.

SELTZER WATER,
FROM LITTON PARK,
Near Healdsburg, - - SONOMA CO., CAL

QUANTITATIVE ANALYSIS.

One wine gallon of water contains of solid constituents 228.69 grains, in the following proportions:

Carbonic Acid (combined)	42.93
Chlorine	78.38
Sulphuric Acid	2.36
Silicic Acid	2.02
Oxide of Iron	2.85
Lime	4.41
Magnesia	5.24
Soda	62.19
Alumina, Ammonia, Potash, Litbia, Boracic Acid, Organic Matter	27.38
Total grains	228.69

The amount of *free* carbonic acid in the water which *escapes on standing* and is not calculated in the above analysis, is equal to 383.75 grains per gallon.

Nature's Specific for the Cure of Indigestion, Costiveness, Piles, Irregularities of the Action of the Kidneys and Liver, Inflammation of the Eyes, Gout, Rheumatism, Etc.

Sold in Pint and Half-pint Bottles, and also by the Gallon.

Delivered in any part of the City, and forwarded to any part of the Country, by application to the Office.

Office and Depot, 439 Bush Street, San Francisco

The Mining Share Market.

The last week closed with symptoms of a revivel in the stock market, hnt the traneactone have, during the present week, hardly jnstified such encouragement, thongh several of the leeding stocke heve steadily, advanced. The gradnal eesing of the money markst in the Eaet which is dependent on the improved aepect of commerciel affairs, will undouhtedly have an effect npon our mining stocks to the extent of caning the pnblio to feel more hopefnl of the near future of the businsse prospects of the whole country, end pnt faith in ventures which mnst bring a goodly return.

Prospecte elong the Cometock appeer to he unu-nally bright. The ore developments on the 1400-ft level of the Celifornia are eeid to far exceed former expectations. The Sierra Nevada is rnnning two drifts on the 700-ft level, one north and ons eonth in entirely virgin ground, which ars liahle almost any day to make valuable ore developments, end the Utah on the north end has just got its new and powerful machinery ready for a thorough and rapid devel pment of the lower levele; while on the south end, the Overman has started her pnmps at the 1000-ft station, and will undonbtedly have her shaft drained in a day or two more, ready to resnme ths development of the fins ore prospects opened on the lower levels a few months since. The yield of the Consolidated Virginie is reported as already $100,000 in excess of that of last month.

The newly elected Board of Trustees of the Savege company hae celled a meeting of the stockholdsrs for ths 17th of August, prox., to teks into consideration ths proposition to increas ths capi'al stock of the compeny to $11,200,000. The Trnstees of the Caledonia company heve aleo celled a special meeting to decide upon the feasibility of inoreasing the capital stock from $2,000,000 to $10,000,000. On Augnst 23d next, the stockholders of the Julia will mest to take aotion on a like propoeition of inorsasing the etock from $3,000,000 to $11,000,000.

New Incorporations.

The following companies have filed certificates of incorporation in the County Clerk's Office at San Francisco:

FORLORN HOPE GOLD QUARTZ M. CO.—July 15. Location: Rough and Ready district, Nevada county. Capital, $300,000. Directors—Guilford Bullard, James Keegan, P. Butler, R. W. Tifft and C. C. Dubsin. The principal place of business will be in Smartsville, Yuba county.

MORSE AND EVANS G. M. Co.—July 15. Location: Columns district, Tuolumne county. Capital, $3,000,000. Directors—L. N. Daugherty, R. Meacham, J. W. Shew, A. K. Grim and B. W. Mudgs.

NEVADA HYDRAULIC M. Co.—July 16. Location: Nevada county, Cal. Capital, $1,000,000. Directors—J. Peart, John S. Colgrove, Walter E. Sell, Charles T. Bridgs and Alvinza Hayward.

HAYWARD CONS. S. M. Co.—July 16. Location: State of Nevada. Capital, $10,000,000. Directors—J. J. Holmes, J. M. Winslow, George K. Glunyss, A. A. Hickox and P. Lyman.

EMIGRANT S. M. Co. July 16. Location: Inyo County, Cal. Capital, $5,000,000. Directors—J. R. Brink, Daniel Buck, B. J. Lee, J. F. Freeman and B. W. Hudgo.

EMPIRE CONS. GOLD AND SILVER M. & M. Co., OF OAKLAND.—July 19. Location: State of Nevada. Capital, $6,000,000. Directors—Elijah Case, Dr. Henry H. James, J. F. Havens, Henry S. Smith and M. McDonnell.

GREAT EASTERN CONS. G. & S. M. & M. Co., OF OAKLAND, having the same directors, etc., as the company last mentioned.

CONCORDIA LUCA G. & S. M. Co.—July 19. Location: Nevada. Trustees—J. T. Hill, W. E. Hall, N. Larco, A. Hestres, E. Caldwell. Capital stock, $10,000,000.

ANGLO-FRENCH GENERAL M. Co. OF THE PACIFIC STATES.—July 21. Objects: To develop, improve, work, buy and sell gold, silver and other mines, and to transact a general mining business on the Pacific Coast. The directors are E. Derbec, Thomas Gnineau, Edd. C. Hinkson, George Callahan and Guy W. Cole. Capital stock, $10,000,000, divided into 100,000 shares. The certificate states that the sum actually subscribed is $5,000,000.

Meetings and Elections.

BEST & BELCHER M. Co.—Trustees, Robert Sherwood (President), Ed. Barron (Vice President), W. S. O'Brien, J. C. Flood and George Congdon; Superintendent, J. G. Fair; Secretary, Wm. Willis.

OROLLAS-POTOSI M. Co.—A. K. P. Harmon (President), J. D. Fry (Vice President), Charles L. Weller, James H. Dobinson, Wm. Norris, H. C. Kibbe and Alpheus Bull. I. L. Requa was re-appointed Superintendent and W. E. Dean, Secretary.

YELLOW JACKET M. Co.—T. G. Taylor (President), H. W. Hazleton (Vice President), F. A. Tritle, D. L. Bliss and T. B. Storer, trustees. The Bank of California was elected Treasurer; George W. Hopkins, Secretary and T. G. Taylor, Superintendent.

"THE LEAVES * * * WERE FOR THE HEALING OF THE NATIONS."

In the modest little plant found growing by the roadside and known as Smart Weed, or Water Pepper, reside medicinal properties of more than ordinary value. In Dr. Pierce's Compound Extract of Smart Weed, those wonderful properties are combined with other vegetable extracts of acknowledged virtues in such a manner as to make it a most efficacious remedy for Colic, Cramps, Summer Complaint, Diarrhœa, Dysentery, Cholera and Cholera Morbus. A celebrated medical author says; "A friend of mine had an only child dangerously ill with Summer Complaint. He had employed a great variety of the usual means for relief, but all appeared unavailing. The child was finally given Smart Weed which was entirely successful. It arrested the vomiting and purging in a short time, and without the aid of other medicine entirely restored the little patient." Dr. Pierces Extract of Smart Weed is sold by all druggists.—*Com.*

A STURTEVANT BLOWER

For Sale Cheap.

No. 2—In good order, with or without belting, shaft, pulleys and galvanized air pipe. Enquire at the BREWERY, corners of Fourteenth and Folsom streets, San Francisco.

Scientific and Practical Books on Mining, Metallurgy, Etc.

Published or issued, wholesale and Retail, by DEWEY CO., MINING AND SCIENTIFIC PRESS Office, S. F.

BY CUIDO KUSTEL,

MINING ENGINEER AND METALLURGIST.

Roasting of Gold and Silver Ores, and the Extraction of their Respective Metals without Quicksilver. 1870.

This rare book on the treatment of gold and silver ores without quicksilver, is liberally illustrated and crammed full of facts. It gives short and concise descriptions of various processes and apparatus employed in this country and in Europe, and explains the why and wherefore.

It contains 142 pages, embracing illustrations of furnaces, implements and working apparatus.

It is a work of great merit, by an author whose reputation is unsurpassed in his speciality.

Price $2.50 coin, or $3 currency, postage free

Concentration of Ores (of all kinds), including the Chlorination Process for Gold-bearing Sulphurets, Arseniurets, and Gold and Silver Ores generally, with 120 Lithographic Diagrams. 1867.

This work is unequaled by any other published, embracing the subjects treated. Its authority is highly esteemed and regarded by its readers; containing, as it does, much essential information to the Miner, Millman, Metallurgist, and other professional workers in ores and minerals, which cannot be found elsewhere in print. It also abounds throughout with facts and instructions rendered valuable by being clearly rendered together and in simple order. It contains 120 diagrams, illustrating machinery, etc., which alone are of the greatest value. PRICE REDUCED TO $5.

Nevada and California Processes of Silver and Gold Extraction, for general use, and especially for the Mining Public of California and Nevada, with full explanations and directions for all metallurgical operations connected with silver and gold from a preliminary examination of the ore to the final casting of the ingot. Also, a description of the general metallurgy of silver ores. 1864.

As its title indicates, this work gives a wide range of information, applicable to all vein miners and workers in precious metals, affording hints and assistance of exceeding value to both the moderately informed and the most expert operator.

Price, $5 in cloth; $6 in leather—coin.

BY OTHER AUTHORS.

The Quartz Operator's Hand-Book; by P. M. Randall. 1871. Revised and Enlarged Edition. Cloth bound, 175 pages. Price, $2.

Sulphurets: What They Are, How Concentrated, How Assayed, and How Worked; with a Chapter on the Blow-Pipe Assay of Minerals. By Wm. M. Barstow, M.D.; 1867; cloth bound, 114 pages. Printed and sold by DEWEY & Co. Price, $1; postage free. The best written work, and most complete work on the subject treated.

ANY OTHER BOOKS DESIRED will be furnished at the most reasonable rates by DEWEY & Co., Mining and Scientific Press Office, S. F.

Designing and Engraving at This Office.

We are prepared to do fine Wood Engraving for illustrating Landscape Scenery, Buildings, Machinery, Works of Art, Manufactured Articles, Trade Marks, Seals, Etc. We have a first-class

Machine for Engraving

A portion of the work, which can be finished thereby more perfectly than by the eye and hand alone. Our patrons can depend upon first-class work always, and at reasonable prices. Samples can be seen at our office.

DEWEY & CO,

The Mining and Scientific Press.

[ESTABLISHED IN SAN FRANCISCO, 1850.]

Is the leading mining journal in America, and enjoys a large circulation among the more intelligent operators and workers in the gold fields of the world.

As a scientific and mechanical representative of the Pacific Coast, it is decidedly popular and a standard journal with the most thrifty industrial people of the Pacific States and Territories. Its authority is of the highest order, and its usefulness in its special sphere unrivalled.

Every public library, mining engineer, metallurgist, mining operator and intelligent mechanic and manufacturer will find profit by its reading.

Subscription, $4 a year, in advance. Sample copies post paid, 10 cents. As an

ADVERTISING

Medium for the Pacific Coast, it is superior to any other journal for all kinds of mining and hydraulic machinery and other mechanical work, building materials new manufactures and inventions. Our rates are very reasonable compared with those of other first-class journals. DEWEY & CO., Publishers.

224 Sansome street, San Francisco.

SUBSCRIBERS are requested to examine the printed address on their papers. If mistakes occur *at any time*, please report them to this office. The last figures (at the extreme right) represent the year that your subscription is paid to. Next to these the day and month is represented. For instance, your subscription being paid to July 4th, 1876, it would be represented, viz: jul 4 76; or 4|76; or jul 4,76.

UNITED STATES

Mineral Land Laws, Revised Statutes,

And Instructions and Forms Under the Same.

We have just issued a pamphlet containing the general mineral land laws of the United States, with instructions of the Commissioner of the Land Office. The contents of this pamphlet comprise all of the Government laws with relation to mineral lands of interest to the mining community, as follows: Mining Statute of May 10th, 1872, with Instructions by the Commissioner of the Land Office; Mining Statute of July 26th, 1866; Mining Statute of July 9th, 1870. Forms required under Mining Act of May 10th, 1872, as follows: Notice of Location; Request for Survey; Application for Patent; Proof of Posting Notice and Diagram of the Claim; Proof that Plat and Notice remained Posted on Claim during Time of Publication; Registers' Certificate of Posting Notice for Sixty Days; Agreement of Publisher; Proof of Publication; Affidavit of $500 Improvements; Statement and Charge of Fees; Proof of Ownership and Possession in Case of Loss or Destruction of Mining Records; Affidavit of Citizenship; Certificate that no Suit is Pending; Power of Attorney; Protest and Adverse Claim; Non-Mineral Affidavit; Proof that no Known Veins Exist in a Placer Claim, etc. There is also given the U. S. Coal Land Law and Regulations thereunder. The work comprises thirty pages, and will be sold, post-free, for 50 cents. It should be in the hands of every one having any mining interests. DEWEY & CO.,

Publishers of MINING AND SCIENTIFIC PRESS, S. F.

N. B.—We have also added to the above publication the REVISED STATUTES OF THE UNITED STATES, so far as relates to Mining Laws.

Every Mechanic

Should have a copy of Brown's

507 MECHANICAL MOVEMENTS,

Illustrated and described.

Inventors, model makers and amateure mechanics and students, will find this work valuable far beyond its cost. Published by DEWEY & Co., Patent Agents and publishers of the Mining and Scientific Press.

Price, post paid, $1.

OAMPO, SAN DIEGO CO., CAL., July 3d, 1874.

MESSRS. DEWEY & CO.—*Gentlemen:* To-day I received the patent and other papers of my animal trap, that you so successfully worked through the patent office for me, for which please accept my best wishes. The chances are that I will have another application for you to make for me before long. I am well satisfied with your manner of doing business, and I think inventors of this coast stand in their own light when they do not put their business into your hands.

I remain yours truly, A. M. GASS.

Mining and Other Companies.

Bandereta Mill and Mining Company—

Location of principal place of business, San Francisco, Cal. Location of works, Coulterville Mining District, Mariposa County, Cal.

And in accordance with law, and an order of the Board of Directors, made on the 17th day of June, 1875, so many shares of each parcel of said stock as may be necessary, will be sold at public auction, at the office of the company, room 15, 408 California street, San Francisco, Cal., on the 2d day of August, 1875, at the hour of 2 o'clock P. M., of said day, to pay said delinquent assessment thereon, together with costs of advertising and expenses of sale.

J. W. TRIPP, Secretary.

Office, Room 16, No. 408 California street, San Francisco, Cal.

Eagle Mine and Mill Company—Location

of works, Lander county, State of Nevada. Location of principal place of business, San Francisco, California.

Notice is hereby given, that at a meeting of the Directors, held on the tenth (10th) day of July, 1875, an assessment, No. 1, of fifty (50) cents per share was levied upon the capital stock of the corporation, payable immediately, in United States gold coin, to the Secretary, at the office of the company, room 8, No. 533 Kearny street, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on Monday, the sixteenth day of August, 1875, will be delinquent, and advertised for sale at public auction, and unless payment is made before, will be sold on the 5th day of September, 1875, to pay the delinquent assessment, together with costs of advertising and expenses of sale.

H. L. BYRNE, Secretary.

Office—Room No. 8, 533 Kearny street, San Francisco, California.

Electric Mining Company—Principal place

of business, San Francisco, State of California. Location of works, Lincoln Mining District, Butte County, State of California.

Notice is hereby given, that at a regular meeting of the Board of Directors, held on the 22d day of June, 1875, an assessment of Five cents per share was levied upon the capital stock of the corporation, payable immediately, in United States gold coin, to the Secretary, at the office of the company, in San Francisco, Cal.

Any stock upon which this assessment shall remain unpaid on the 26th day of July, 1875, will be delinquent, and advertised for sale at public auction, and unless payment is made before, will be sold on Monday, the 16th day of August, 1875, to pay the delinquent assessment, together with costs of advertising and expenses of sale.

A. B. PAUL, Secretary.

Office, No. 318 California street, San Francisco, California. Room No. 13.

Gold Mountain Mining Company—Principal

place of business, San Francisco, Cal. Location of works, Lower Rancheria, Amador County, Cal.

Notice is hereby given, that at a meeting of the Board of Directors, held on the 1st day of July, 1875, an assessment (No. 4) of twenty-five cents per share was levied upon the capital stock of the corporation, payable immediately, in United States gold and silver coin, to the Secretary, at the office, No. 116 Leidesdorff street, San Francisco, Cal.

Any stock upon which this assessment shall remain unpaid on the 7th day of August, 1875, will be delinquent, and advertised for sale at public auction, and unless payment is made before, will be sold on Monday, the 23d day of August, 1875, to pay the delinquent assessment, together with costs of advertising and expenses of sale.

W. A. KNAPP, Secretary.

Office—116 Leidesdorff street, San Francisco, Cal.

Morning Star Gold and Silver Mining

Company. Location of principal place of business, San Francisco, California. Location of works, Great Mogul District, Alpine County, State of California.

Notice is hereby given, that at a meeting of the Board of Directors, held on the 21st day of June, 1875, an assessment, No. 25, of one dollar (1.00) per share was levied upon the capital stock of the corporation, payable immediately, in United States gold coin, to the Secretary, at the office of the company, room 1, No. 402 Montgomery street, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 21th day of July, A. D., 1875, will be delinquent, and advertised for sale at public auction, and unless payment is made before, will be sold on Saturday, the 14th day of August, 1875, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Directors.

G. H. BOGART, Secretary.

Office, room 1, No. 402 Montgomery street, San Francisco, California.

Silver Sprout Mining Company—Principal

place of business, San Francisco, State of California. Location of works, Kearsarge Mining District, Inyo County, California.

Notice is hereby given, that at a meeting of the Board of Directors, held on the third day of July, 1875, an assessment of five cents per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to the Secretary at the office of the company in San Francisco.

Any stock upon which this assessment shall remain unpaid on the tenth day of August, 1875, will be delinquent, and advertised for sale at public auction, and unless payment is made before, will be sold on Wednesday, the 1st (first) day of September, 1875, to pay the delinquent assessment, together with costs of advertising and expenses of sale. T. B. WINGARD, Secretary.

Office—No. 318 California street, San Francisco, (Room No. 13.)

Tolman and Miller Mill and Mining Company.

Location of principal place of business, San Francisco, California. Location of works, West Point, Calaveras County, California.

Notice is hereby given, that at a meeting of the Board of Directors, held on the 14th day of July, 1875, an assessment, No. 2, of thirty (30) cents per share was levied upon the capital stock of the corporation, payable immediately, in United States gold coin, to the Secretary, at the office of the company, room 1, No. 402 Montgomery street, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 16th day of August, 1875, will be delinquent, and advertised for sale at public auction, and unless payment is made before, will be sold on Monday, the 6th day of September, 1875, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Directors.

O. H. BOGART, Secretary.

Office, room 1, No. 402 Montgomery street, San Francisco, California.

Umpire Tunnel and Mining Company—

Location of principal place of business, San Francisco, Cal.

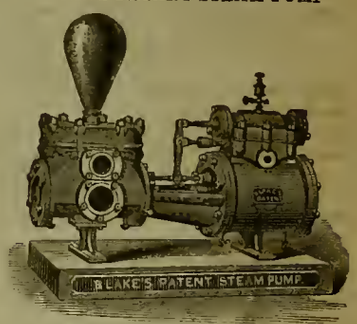
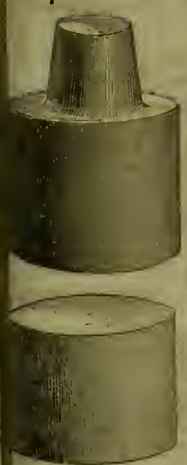
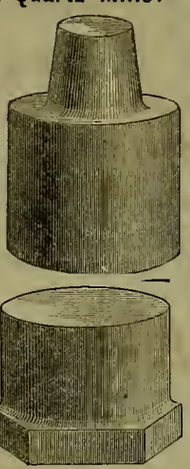
BLAKE'S PATENT STEAM PUMP



Over 7,500 in Successful Use in the Unit States.

Improved Cast and Forged Steel Shoes and Dies for Quartz Mills.





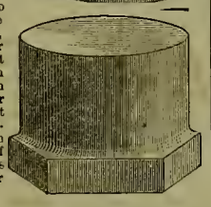
[PATENTED MAY 26TH, 1874.]

Price Reduced to 16 Cents Per Pound.

SAN FRANCISCO, November 10th, 1874.

To Supts. of Quartz Mills and Mining Men generally:

We take pleasure in stating that owing to the rapid increase in our orders, our Pittsburg Manufacturers have been compelled to add largely to their works—a new gas furnace and heavier trip hammer—and are thus enabled to reduce the cost of steel and at the same time produce SHOES AND DIES superior to any yet manufactured. We have consequently reduced the price to 16 cents per pound and solicit a trial order, guaranteeing that you will find them at least 10 per cent. cheaper than the best iron. There are no STEEL SHOES AND DIES made excepting under our patent and sold at this office, or by our authorized agents, though certain Eastern manufacturers advertise STEEL SHOES AND DIES which are only cast iron hardened by the addition of a composition. They will not out-wear two sets of common iron, though called steel. They are very brittle and are not capable of being tempered, flying from under the hammer like cast iron. Our STEEL SHOES AND DIES are in use in many of the largest mills on the Pacific Coast, and all who have tried them pronounce them cheaper and far superior to iron in every respect, even at the old price of 20 cents per pound. Their advantages over iron are cheapness on first cost, increased crushing capacity, time saved in changing and in setting tappets, increased value of amalgam by absence of iron dust and chippings, and a saving of 75 per cent. in freight. It takes 50 days to fill orders from the manufactory East. Price 16 cents per pound shipped at San Francisco. Terms liberal.



Address all orders, with dimensions, to

GIANT POWDER.

Patented May 26, 1868.

THE ONLY SAFE BLASTING POWDER IN USE.

GIANT POWDER, NO. 1,

For hard and wet Rock, Iron, Copper, etc., and Submarine Blasting.

GIANT POWDER, NO. 2,

For medium and seemy Rock, Lime, Marble, Sulphur, Coal, Pipe Clay and Grevel Bank Blasting, Wood, etc.

Its EXCLUSIVE use saves from 30 to 60 per cent. in expenses, besides doing the work in half the time required for black powder.

☞ The only Blasting Powder used in Europe and the Eastern States.

BANDMANN, NIELSEN & CO.,

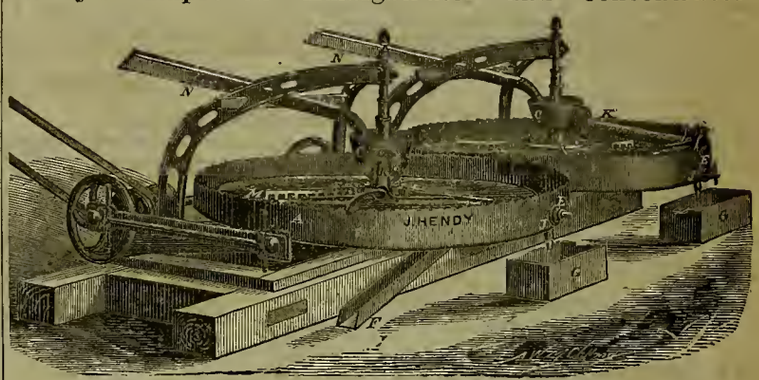
OVER $3,500 PER MONTH SAVED

BY THE USE OF

Hendy's Improved Amalgamator and Concentrator



Can be seen at the Manufactory, No. 32 Fremont Street, San Francisco.

SAN FRANCISCO, April 27, 1872.

JOSHUA HENDY, Esq.—*Dear Sir:*—As a practical miner and millman, I take pleasure in recommending the use of your Concentrators in all mills where gold or silver ores are reduced. No mills should be without them, for the following reasons:

1st. They are good sizers (no perfect concentration in pulverized ores can be effected without first sizing).

2d. The best Concentrator I have ever known—(the concentrated stuff only containing 5 per cent. of sand).

3d. They are good amalgamators, light (feathery) particles of amalgam and particles of coated gold by attrition are brightened, and from their specific gravity and the action of the pan, fall to the bottom and adhere.

4th. They require but little power and attention to run them, and with ordinary care will last for years.

I have been familiar with the workings of your Concentretors for four years past; have run them myself in the North Ster Mine, Grass Valley; am familiar with their practical workings on the Empire Mine, Grass Valley; St. Patrick, Placer Co.; St. Lawrence, El Dorado Co.; Oake and Reese, Mariposa Co., and most cheerfully give you this testimonial. For further information you are at liberty to refer to,

Youre respectfully,

JAS. H. CROSSMAN, M. E.

409 California street, or Cosmopolitan Hotel.

SAN FRANCISCO, February 10, 1874.

OFFICE SUPERINTENDENT OF KEYSTONE CON. M. CO., AMADOR, AMADOR COUNTY.

MR. J. HENDY—*Dear Sir:*—In answer to your inquiries as to your Concentrators furnished our company last July, I would say that I am more than pleased with them; and the saving to the company has been over $3,500 per month more than with the blankets and huddles formerly in use. O. C. HEWITT, Supt.

OFFICE SUMNER MINE, KERNVILLE, April 27, 1874.

J. HENDY, ESQ.—*Dear Sir:* Having four of your Concentrators in use at our Mills for four or five months, which for saving Amalgam and for concentrating Sulphurets, are a success, beyond a doubt, I feel it a duty due you and those interested in Quartz Mills, to recommend them.

As further evidence of their worth, I now order TWELVE more of your Machines for our new Mill, now in course of erection. E. R. BURKE, Superintendent.

For description send for Circuler.

Ayer's Sarsaparilla,

FOR PURIFYING THE BLOOD.

This compound of the vegetable alteratives, Sarsaparilla, Dock, Stillingia and Mandrake with the Iodides of Potassium and Iron makes a most effectual cure of a series of complaints which are very prevalent and afflicting. It purifies the blood, purges out the lurking humors in the system, that undermine health and settle into troublesome disorders. Eruptions of the skin are the appearance on the surface of humors that should be expelled from the blood. Internal derangements are the determination of these same humors to some internal organ, or organs, whose action they derange, and whose substance they disease and destroy. AYER'S SARSAPARILLA expels these humors from the blood. When they are gone, the disorders they produce disappear, such as Ulcerations of the Liver, Stomach, Kidneys, Lungs, Eruptions and Eruptive Diseases of the Skin, St. Anthony's Fire, Rose or Erysipelas, Pimples, Pustules, Blotches, Boils, Tumors, Tetter and Salt Rheum, Scald Head, Ringworm, Ulcers and Sores, Rheumatism, Neuralgia, Pain in the Bones, Side and Head, Female Weakness, Sterility, Leucorrhœa arising from internal ulceration and uterine disease, Dropsy, Dyspepsia, Emaciation and General Debility. With their departure health returns.

MINING AND SCIENTIFIC PRESS.

An Illustrated Journal of Mining, Popular Science and General News.

BY DEWEY & CO., Patent Solicitors.

SAN FRANCISCO, SATURDAY, JULY 31, 1875.

VOLUME XXX Number 5.

The Coming Exhibition.

Exhibitors at the coming Mechanics' Institote Fair are prepsring their articles, aud some of the heavy goods, machinery, etc., will be moved into the hnilding next week. From information derived from Mr. Cnlver, Secretary, and Mr. Gillmore, General Superintendent, we should judge that the exhibition will far surpass anytbing of the kind yet held in Sau Francisco.

The fair will open Angust 17th, at 11 A. M., and the oration will be delivered hy Hon. J. W. Shaw. It is stated that the applications for space exceed the exhibiting space ahout 20 per cent., notwithstending an enlargement of 20,000 feet has heen made. The machinery department will occnpy the whole of the easterly winge, and will he full of moving machinery and mechanical displays. The line of shsfting has been extended 120 feet. A steam engine of 120 horse-power is heing built by Prescott, Scott & Co., to rnn the machinery, the use of which engine will he given free.

Several exhibitors of mining drills will have them in actual operation, so that miners can see them working and jndge of their comperative merits. The Cornell Watch Co. will have a shop and show the *modus operandi* of watch making. They will also put in a heavy die press and strike off medals. An expert in glass blowing and spinning will also he at the exhibition.

The art gallery will he under the superintendence of Mr. Benoni Irving, than whom a better eelection could not have been made. All onr local artists will contribnte, and many valnable pictures and worke of art belonging to public spirited citizens will he on exhibition. This department will be complete in detail and general arrangements. The art gallery is heing retinted and refitted. The department will he under the special care of Messrs. Scott Tidhall, P. Mezzera, S. M. Brookes, D. Bneh and E. Deeken, and will be exceedingly attractive.

The horticnltnral department is under the immediate eoperintendence of Chas. Schnmann, who is busy completing the same from the designs of Mr. Hammond Hall. The garden will he a heautiful and attractive feature, with its lswns, flower heds, rockeries, rnstic work and fountains. There will he an excellent display of the flowers and fruits of California. A fine display of ferns will also be made. The detsils of the work are being pushed ahead vigoronsly.

Mr. Wilcox, the contractor for the enlargement and alteration of the hnilding, will he through on Satnrdey, and exhibitors will begin to fit up their stends on Monday. The Locating Committee have been husy allotting space, and will prohahly rejoice when they complete the job.

The msnagers have concluded this year to publish a catalogue themselves, which will contain no advertisements, and will he neat and modest in appearance. The restaurant will be kept hy Mr. Hepburn, a well known caterer. A feature added to the exhibition this year will be the reception room, where visitors can rest in qniet, away from the noise and hustle of the crowd, and where there will be attendants to take care of hats, cloaks, etc., of the ladies, free of charge.

SILVER COINAGE.—The Direotor of Mints, now on thie coest busily preparing the mints in thie city and Carson for an increased eilver coinage, eays, in a letter from Careon, dated Jnly 16th: "The hydraulic presses and other machinery sent ont here last year have been placed in position, and will more than donble the coinage capacity of the Careon mint, and it is estimated that with the necessary coinege of gold there csn be coined half dollers and dimes. The snpply of trade dollars will prohably be sufficient until Septemher 1st. In the meantime, I hope to he able to arrange for the coinage of divicionary silver coins at the two mints at San Francieco and Carson, at the rate of from $1,200,000 to $1,500,000 per month." It ie estimated that the amount of fractional silver turned out from the coinage minte within the next six months will he at least $4,000,000.

Geological Formations in Monument Park, Colorado.

There is a certain degree of obscurity ahout the geology of the district from the source of Plum creek to the Arkansas in Colorado. The modern appearance of the group of coarse sandstones and conglomerates, ahove the true cretaceous beds and their position with reference to the granites, ioduces the belief that they helonged to the miocene period, and in Hayden's third annual report of 1869 he gave them the name of the Mouument creek gronp. For a distance of from fifteen to twenty miles they

COLUMNS IN MONUMENT PARK, COLORADO.

appesr to jut up against the base of the mountains, with an inclination of not more than fifteen degrees et the highest, and usually not more than three to five degrees. For example, Prof. Hayden ssye that the red sandstones at the north ends lie on the sides of the granite

Tertiary Columns in Monument Park.

foothills at an angle of seventy to eighty degrees and suddenly disappeer under the nearly horizontal beds of coarse quartzose sandstones. It is out of the sandstones that meteoric agencies have carved the remarkahle forme which have given names to the little streams and localities in this region.

There is one locality in the valley of Monument creek, called Monument Park, from the great number of columns which are standing thickly over the surface, each one surmounted with a cap of harder material. The shaft of the column is usually thick at the hase, rising np ten or twenty feet, taporing to the cap, composed of a coarse aggregate of quartz grains, small pohhles, all water worn, very loosely held together with rather coarse sand cement. The cap is a deep rust color, composed of sand cemented with oxide of iron and hy its greater hardness has resisted more effectually the eroding agencies. Professor Hayden does not helieve that all the effects now seen were accomplished by the ordinary atmospheric agencies at present in operation in the region referred to, although the air, rain and snow may have done much to give the monuments their present form. The greater part of the erosion must date hack into the past, at least to the post pliocene period.

It is very probable that water had much to do with the formation of these monuments at a time when there was a far greater supply in the locality then at present. The entire surface of the country must have been on a level with these caps at least, and probably much higher. The caps themselves are nothing more than concretions, mostly rounded and flattened, while intervening materials have been slowly worn out and carried away.

IDAHO MINES.—The Wagontown mines, Idaho, are improving, and the prospects are very favorable in that quarter. There have been several shipments of splendid ore made from the Henrietta mine to be worked at the Humboldt reduction works at Winnemucca. The Pauper has also made several shipments of rich ore to the same place. The new hoisting works on Oro Fino are going up rapidly, and with a large force of men will be in full operation by August 1st. Illinois Central and Golden Chariot are also putting up new works. The South Mountain Consolidated mining company at South mountain are putting in a new engine on the Bay State mine, and flattering reports continue to he received from that camp.

THE new combination shaft on the Chollar-Potosi, etc., is going steadily ahead at the rate of three feet per day, the rock in the bottom still bleeting out finely. Arrengements for the erection of the new hoisting works building and machinery are still advancing as rapidly as the nature of the work will admit.

The Belcher air shaft is finished down to the 1200-ft level.

San Francisco and the Mines.

The effect of the remarkable development of mineral wealth on the Comstock during the past year, which is only now beginning to be understood, has been most wonderful and unmistakable on the growth of San Francisco. Within the past few years this city has experienced its most substantial period of prosperity, and it now boasts of a ratio of increase in population and business surpassed hy no city in the world. The late wonderful developments have demonstrated beyond a doubt that the mineral field which looks to this city mainly for its supplies, and which is principally owned here, is almost limitless in extent and value. Let not our capitalists then hegrudge the money spent in mining enterprise. Although much that has gone out is still "bread upon the waters" not yet returned, San Francisco will hedge up her main source of wealth and prosperity when she draws her purse strings on the great leading interests of the State.

Mining is not all adventure, nor is adventure, judiciously pisned, an altogether forbidden thing in the counting house or even in the bankers' closet. Very close calculations can be made in mining entorprises on quite slight and inexpensive trials, where experience and calm judgment are allowed to control. The miners of this coast have now acquired a degree of experience, which, if rightly applied, may enable them to carry on their work intelligently, and, where integrity prevails, there is little risk of loss. Capital ought easily he secured where good evidence can he given that it will he judiciously expended and honestly guarded. Let honesty, patience and perseverance he directed by indomitable Anglo-Saxon will, and we may remove mountains and uncover wealth which will make the name of California blaze again.

The mountains look to the city for capital, and the city looks to the mountains for the profit on that capital. If the capital is withheld there is no profit for either party. The benefits which have resulted hy investments in the mines during the pest few years ought to be incentive enough to our city capitalists to induce them to invest still further. If they will turn their attention nearer home, moreover, they will benefit their own State as well as our neighbors.

Most of the very elegant and attractive buildings now being erected in San Francisco are being put up hy mining capitalists with money made from mining ventures. This fact alone shows the benefits the mines confer on this city. Yet there are many here who decry mining ventures on all occasions—perhaps because they themselves have been unlucky. Still, as long as there are mines to work there will be found men to work them and capitalists to invest in them; and those who do not take the risk should not begrudge the profit made hy those who make the venture.

THE Ophir mine, which has been shut down, will not again be ready to resume the usual work under four or five weeks time. In the meantime the new incline hoisting engines will be finished up ready for steady work, the new and powerful pumping engine will he ready to start up, 300 ft of the shaft retimbered, and the new hoisting works building will be completed; so that when everything is again in readiness to resume full operations, the Ophir will possess a hoisting works and machinery for hoisting and pumping second in capacity to none on the line of the Comstock.

YELLOW JACKET MINE.—The annual report of the Secretary of this mine shows cash on hand July 1st, 1875, $40,858.44; amount received from assessments during the year, $360,000; all other sources, $7,348.30; total, $408,206.83. Disbursements for the year, $339,553.75; balance on hand, July 1st, 1874, $68,653.08.

The coinage for the fiscal year at the mints at Philadelphia, San Francisco and Carson, will approximate as follows: Gold, $34,000,000; trade dollars, $6,000,000; subsidiary silver coin, $5,000,000; minor coinage, $250,000,

CORRESPONDENCE.

South Mountain District.

EDITORS PRESS:—Having never seen anything concerning our camp in yonr valuabls paper, ws take ths liberty to forwsrd you a few items. South mountsin is located in Owyhee county, Idaho, one hundred and eighty miles north of Winnemucca and twenty-five miles south of Silver City.

Active operations were commenced here in the month of August, 1874, by the South Mountain Consolidated silver mining oompany. They built two furnaces for smslting the ores and made one run last wintsr. They havs had one furnace rnnning for the past two aod a half montbs, and it is ths report that they made expenses and cleared $20,000. The company own a large number of mines, and the most prominent of these are the Bay State, Golconda and Crown Point, all of which show fine bodies of ore, and it is claimed they havs ore enough in sight for a twelve months' run. The ores of this camp are far better than the majority of base metal camps on this coast, being rich in silver, averaging from $100 to $500 a ton and it is not uncommon to find $1,000 ore. The bullion of the S. M. C. M. Co. goes from $350 to $650 a ton in silver, thus making lead smelting a very profitable business here.

What we want here now is *more capital*, for there is a large number of outside mines that can he bought very cheap, for the owners have not the desired capital for working them, and theso minee all have an abundance of *good ore*, and some of them are well prospected. The people here would like to see another company come in here, and wonld do all in their power to help them start. A custom smelting works wonld do well, as the most of the mines have from five to fifty tons of ore on their dumps, and the owners would take out more if they could dispose of it.

We have all the facilities here for lead smelting: Water in abundance, wood at five dollars a cord, coal twenty-five cents a hushel, and sny quautity of ore, *and good ore*.

To conclude, I will say that moneyed men of San Francisco cannot find a better place to invest than here. They would be certain by competent management to make money. I certainly think, from what I have seen in the different lead camps on the coast, that $50,000 invested in minee and building a fnroace here would clear itself and all expenses in three monthe. "SMELTER."

South Monntain, Idaho, July 15, 1875.

Goods for Exhibition.

The *Iron Age* makes the report that a mowing machine manufaoturer iutends to spend $10,000 ou a single machine, to be exhibited at the Centennial, a text for some good advice to intending exhibitors generally. The advice is, that the msnufacturers shall exhibit the best goods they can make every dsy in the week in their own shops. "Nickel plated etoves with gold trimmiugs, carpenters' tools with pearl handles, sawa with etched blades, and similar fancy articles might be well enough in their proper places, but they should not be shown among the legitimate products of our foundries or tool shops. * * * * If visitors look at mowing machines, they want to see machines with which it would be possible to cut grass; if they look at stovee, they want to see stoves in which it is possible to make a satisfactory fire; if at tools, they wsnt to see practical tools with which a mechanic can work." The *Iron Age* does not depreciate all attempts at decorative art iu the maunfacture of articles intended solely for use, but properly recommends that after the article has been perfected the artist shall be called in to give grace to curvee and beauty to the whole form. "He may then stop content if the object be one of utility only. Excessive ornamentation is always ugly, and ornamentation out of place is barbaric."

DECOLORIZING PROPERTY OF OZONE.—One of the most striking properties of ozone, says M. A. Boilot is ite bleaching power. The effects ascribed to chlorine are really due to ozone. Ozone employed directly acts ae au oxydizing agent laying hold of the hydrogen of the subetance with which it is in contact, whence reenlts bleaching, if the body is colored. On allowing the chlorine to act upon any animal or vegetable matter, it deoomposee a certain quantity of water and eeizes its hydrogen, forming hydrochloric acid. The oxygeu set free by this reaction is trausformed into ozoue, which, in its turo, lays hold of hydrogen preseut in organic matter.

INDUSTRIAL ENTERPRISE IN TURKEY.—Two iudustrial uudertakinge are reported iu a letter to the *Bassiret* to have been set on foot at Tirnovo, in Bulgaria. One ie a blacking manufactory, the other a soap manufactory. It ie something to know that enterprise is not quite extiuct in Turkey. As the *Levant Herald* says: "These undertakings will thiive unless some over-zealous governor takes it into his head to tax all the profits out of them on bebalf of the government.".

Sound Castings.

To obtain good and sound oastings, in all casss, and under all circumstances, is ths chief engrossing cars of all founders. There are of course many established rules and forms of procedure gathered from ths experience of msny years, that generally serve the founder to a sufficient extent to obtain good csstings, as a rule, and to make "wasters" the exception.

If thoronghly practical msn were to add a precise knowledge of what may be supposed to he taking place, in and out of ths mold, the proportion of bad castings would he much rsduced. It is not only the csstings which—broken or blown in ths molds—cannot possibly hs used, that ought to be included under the head of unsound castings. There are, throughout the whole range of castings, delivered appsrently sound and complete from the foundry, a considerable portion in which it is only a question of time as to how long they will hold together. It is notorious that the greater proportion of break-downs in fly-wheels, castings in motion, or castings under pressure, ars occasioned by some inherent defect or liability to hreak in the casting itself, sincs the broken seotion ie frequently of much more than the requisite area to resist any possible etrain that can have occured. These are the unsound castings of which we wonld warn both purchasers and producers.

Aa to the unsoundness of castings produced by blow-holes or scnm, this is usually patent to the eye of the foonder, at least, though not alwaye to that of the customer, after being puttied up, and can be tested by the blows of a small hammer upon any snrface whose soundness may be suspected.

The tendency to form blow holes is well understood among founders and may be caused in two ways: either hy the imprisonment of the air originally contained in the mold, or by the generation of steam or gases from the sides of the mold and oore. It is surprising how little power of reasoning from cause to effect there is as a rule among practical men, to whom hoth the cause and the effect may be perfectly plain and pateut.

Given a case where a casting is produced covered in places with blow holee, the causes of the effects may he accurately defined. In the first place these blow holes are produced by the presence of a gaseous body displacing the metal. There are then two possibilities—either this gas is the legitimate air which has not been allowed to escape, or it is a further accumulation of steam or gae generated from the mold; neither of these poesibilities ehould have existed. In the first place, any possible air pocket in the mold should be thoroughly ventilated hy an escape air hole, and whilst the metal is being poured at one runner, the air ehould be allowed to escape elsewhere. In the second place the mold and cores should be so thoronghly dry as to prevent the formation of steam; and fnrther, their compoeition should beso carefully selected as to preclude the employment of materiale liable to burn or to generate much gas. The ventilation from the cores should be especially looked to, as they are generally found to become damp after running the metal, even when thoroughly dried. In the case of large castings a great deal depends on the open and porous nature of the mold hed.

If, then, the following points are always rigidly looked to, there should bo little fear at any time of a porous or air-blown casting. 1. That whilat the metal is heing poured at any runner, there should be free egress for the imprisoned air through snother exit. 2. That all pockets or high portions of the mold ehould have separate additional air escape. 3. That the mold and ccre be thoronghly dry, to prevent the evolution of steam as much as possible. 4. That the materials forming the mold and core should be already burnt, so as not to give off gases with readinese on contact with the molten metal. 5. That where the casting is long and has a double eurface, one above the other, an infinitely better casting may more readily be obtained by casting the aame with its length considerably inclined from the horizontal, and pour ou to the lower face firet, or placed vertically and run with a head. A very frequent canse of the generation of an excessive quantity of gas in a mold is the mixture of too much coal dust and slack in the mold, and nsing the sand too wet for facility in molding.—*Iron*.

"WHERE did the ore in tho iron mountains come from?" We may as well ask where did the turpentine, rosin and tar in the pine tree come from? Can the chemist detect it in the eoil from which the tree drawe its food, or in the air that surrounds it? The duty of the finite mind is to study effects, not primal causes. You may eetimate the tons of iron ores in the iron monntains, or tons of ooal in the coal basins, or amount of oree in the lead, copper and zinc fields, and may fuse these in the future and tell the etatus of the coming populations; you may estimate the number of barrels of tar and gallons of turpentine in the pine flora of a State—yet, the origin of the slippery atoms of the iron and turpentine refuse to be located.

THE MAGNETIC CURVES.—Rev. G. H. Hopkine gives the following method for fixing the curves which steel filings take when under the action of a bar magnet. The filings, having been prepared so as to be nearly the same size as possible, and that eize very minute, are poured into a mortar, and a small quantity of finely powdered resin ie added: these are stired together until the two substances are completely mixed, and then, considerable pressnre being exerted npon they are rubbed.

Tanning Buckskin.

Farmers, minsrs and others ars often at a loss for a good recipe for tanning the skins of small animals which may come in their way, and which might be advantageonsly utilized with a very little labor.

Kid Leather

Is usually made of sheep and lamb skins. The flesh side is costed with a paste of thick lime water, and rolled up until the wool can be removed, when the skins are subjected to the hran bath. Whsn taken from it and thoroughly cleansed, they are put into what is called the "white bath," composed of, say, one pound of alum to one gallon of water and about one-fourth pouod of sslt. This solntion is made boiling hot, and the skins passed throngh it succesively; after which they are immersed and left in it for ten minutes. A paste is then made by gradually adding to this solution (and constant stirring) one and one-fourth pounds wheat flour for each gallon of the solution. gently heated; and subsequently the yolks of five sggs, and then iucorporating the whole thoroughly. The ekins are put into this paste, and left twenty-four houre; after which they are hung on poles and left to dry for a week or more, as may bs necessary. They are then softened by heing drawn acroes a "etaking iron"—ths edge of a shovel will answer—and may be polished with a smooth flat iron, carefully heated and managed in the same way as that used by a laundress. They will become soft and as white ae snow. Color can he imparted with dyestuffs as may he desired. If the skins are wanted for mats, robes or furs, omit the liming and branning, and proceed at once to the alum and paste bath.

The above procese is oalled "tawing." A simple method for robea and mats is merely a solution of alum and salt; but the drawing of dampness is a eerious objection to it. Of course in all processee where salt ie used, there will be dampness to some extent.

Buckskin.

The American Indians, in tanning buckskin, use braine: that is they exercise their own brains by taking the hrains of animals, and placing them with the skins in a large earthen pot and heating them to about niuety-five degreee; which converts the moistened brain into a kind of lather and makes the skins olean and pliable. After being rung out they are stretched by means of thongs, and constantly rnbbed with a smooth etone eo as to expel the water and fat.

Tanning and curring leather partakes more of the arts and sciences than most people are willing to allow. While it is a very disagreeable trade to most persons, it presents a large field for the chemist, and if any pereon wishes to know more about he had better learn the trade.

Yet almost any person can very successfully do all ahove deecribed. Very often a farmer would willingly go to the trouble, if he only knew how, to tan a nice skin for housings for his horses, or robes for hie cutter, or for glovee and mittens. By boiling oak leaves a decoction may be made strong enough to tau ekins for that purpose. When the decoction becomes weak, renew it; but always first ecrape off all fat and adhering flesh.

Boye often tan ground hog skins for whip lashes with "soft soap."

ANOTHER STEAM HORSE.—Mr. Fortin Hermann, says *Les Mondes*, is testiug a machine which is moved by articulated feet which are euccessively planted upon. the ground. Two feet act from the front body aod two from the rear, being pressed downward by steam, which besides, in a horizontal engine, oscillates rods which, acting upon the feet, cause the apparatus to drag itself along. From experimeuts cited, it appears that the feet, when shod with rubber and charged with a weight of 2.2 lbs. per 0.4 inch, indicated an adhesion equal to 0.75 of the weight of the motive machino. The apparatus travels at the rate of from 4 to 4.8 milee per hour; and hy a new arrangement, in which one pair of feet trot while the other pair amble, it is expected to run at the rate of twelve milee. It will ascend grades of one in ten with qnite heavy loads.

CHEMICAL ENERGY OF FLAMES.—Experiments have been recently made hy MM. Riche and Bondy to determine the relative chemical "light strength" of various flames. They arrange the flames studied by them in the following series, the weakest being put first, and the nnmbers representing it the relative chemical energy: Drummond light, 3; zinc burning in oxygen, 4; magnesium lamp, 5; flame of nitrous gas in sulphide of carbon vapor, 6; currsut of uitrons gas directed to carbon burning in a veesel, 6–7; current of oxygen, 7; current of oxygen directed to sulphur burning in a vessel, 8. Thus it appears that the flame of eulphur in oxygen is remarkable for its ohemical energy, and is therefore well suited for photographio purposes.

A PHILOSOPHER once said it was wiser to put on shoes than to seek for a land covered with leather. The street pavement question is aa old as the cities of the Tigris valley, but in London they are about to try to settle it by India rutber wheel tiree. The rubber manufacturers declare themselves able now, by improved processes, to afford a tire cheaper than iron, of longer wear, and, in every other respect, of couree, much better. Indeed, in Berlin, now under the Empire, a faster city than London, the experiment is a complete success.

The Universal Diffusion of Heat the End of all End.

Prof. Balfonr Stewart recently delivered a very interesting lectnrs in Manchestsr, England, on the "Energies of Light and Heat." The lecturer explained ths two great laws of thermo-dynamics, one of which determines the quantity of mechanical snergy necessary to produce one degree of heat, and the other, ths law according to which heat may be convertsd into work.

This latter law showed that no work could be ohtained ont of heat unless we had a fall of heat from a highsr to a lower degrse, just as we could get no work out of water unlsss it fell from a higher to a lower level. Upon this principle the uses of the boiler and condenser in a eteam engine were explained, and in ths work done by the globe, it was shown that ths heat passed from a great hoiler in the shape of ths equator to condensers in the shape of the poles. Our winds wsre due to the paseing, in obedience to this principle, of the heat from the equator to the poles. Whils all work, as in the boring of a cannon or in friction, could be ohanged into hsat, all heat could not be changed into work. According to this principle of the universs, the universal diffusion of heat would ultimately bs ths fate of all energy.

While ths prinoipls of the conversion of energy was quite trne, there was also another principle equally true, called the dissipation of energy. That was, as it were, the great communist of the world. It tended to distribute itself equally in suoh a way that no work could be got ont of it, and would ultimately bring the visible universe to an end, at least, so far as available energy was concerned. Heat denoted two kinds of energy, namely, absorbed heat and radiant light and heat. Hot hodies parted with their heat to cold bodies by three processes—oonduction, oonvention and radiation.

IN respect to the working of the St. John del Rey silver mine in Brazil, owned by English capitalists, *Herapath's Journal* observes that a large part of the profitable result obtained is dne to the reduced expenditnre in re-opening the mine upon improved mining principles, aud providing it with improved machinery.

HALF YEAR.

Year.	Produce.	Cost.	Profit.
1875.....	£144,076	£ 60,834	£83,241
1866.....	204,717	124,278	80,429

It will be seen that profits for the past year are ae much as they were for 1866, although the yield in 1866 was £204,717, while that of 1875 was only £144,076.

SALT WATEN IOE.—When the sea freezes, there remaine in the cells or pores of the ice a very strong orine, so that water obtained from melting eea ice is unpalatable. But if the ice is drifted on the shore eo that the brine by its greater specifio gravity may drain off, ae it oan through the intercommunioatione of the oells, water obtained by melting it is fresh. Such is the opinion of Dr. John Rae derived from experience in eeveral long journoys to the Arctic coast.

CARELESSNESS.—Professor Able, in a recent lecture at the Royal Institution, London, gave some instancee of the recklessness of miners in the use of explosives. They have been known to open a gunpowder barrel with a crowbar or a stone, or even with a red-hot poker; dynamite is apt to freeze, and is taken to bed over night by the workman who is to nee it in the morning, or put in the oven while he eats his breakfast.

COVERING COTTON WITH SILK.—A method of covering ootton with silk has been devised by A. Mnller. The silk is dissolved in hydrochlorio acid, or an ammoniacal solution of copper or nickel. Water is added until the solution begins to cloud, when the cotton, previously mordanted, is immersed in it for a few minutes. When taken out it will be found to he plated with silk.

NEW PROPERTY OF GLYCERINE.—R. Godeffroy, on examining a chemically pure glycerine, found that when heated to 302° Fah. it took fire, and burnt with a eteady, hlne, non-luminous flame, without diffusing any odor or leaving a residue. The glycerine had the specifio gravity 1.2609. This property enables glyoerine of lower specific gravity to be burnt hy means of a lamp wick.

THE coal mines of Bellingham hay are doing well, and the new discovery on the Nooksack is said to be a success. The farmers up that way and on the Semiahmoo are joyous over their crops this year. They will soon commence harvesting, and there will be a great demand for harvest hands.

THE Seattle *Dispatch* says: Mr. Ireland and other prospectore have found a very rich gold and silver lead on one of the tribntaries of the Skykomish. Everybody up the river hae a slight attack of quartz fever in oousequence. Thia quartz is supposed to be qnite rich and the lead is extensive.

A BEE MANY THOUSAND YEARS OLD.—The English papers annonnce the discovery of a bee in a fragment of milletone grit, and what adds materially to the discovery ie the report that it was living when found, but unfortunately the slab fell into the hands of a rustic—a boy, who, when he broke the atone and saw the bee slowing reviving, instantly dispatched him.

Mechanical Progress.

Abrasion and Wear of Metals.

The United States board to test iron, steel, etc., appointed hy the President of the United States, has asenmed, ae a part of its work, the investigation of the methods and effects of abrasion and wear of metals in engineering and mechanical operations. The committee announce thst they would he plessed to receive from any reliable source such precise data and such information as wonld cnable the secretary to compilo a statomeut of the mode of deformation, tbe rapidity of abrasiou and the laws governing wear iu any important typical or exceptional cases.

The executive officers of all lines of railway may render valuahlo aid by furnishing statements of the wear of rails per ton of transportation, speoifying with care the original woight, the make and the character of tho rail, the total amount of transportation, the length of time occupied, and stating whether the rail finally broko or wus removed. Specimens of rails remarkable either for endnrance or lack of this qnality, if aent to the committee, will he of use in assisting the determiuution of the chemical and otber properties which most affect the value of the material nndor the etated conditione of use. Similar statistics and information in regard to the wear of whecls, axlee and other parts of rolling stock and machinery will he equally valnahls. Engineers having in any instance noted and accurstely recorded such data, are requested to transmit to this committee copies of their memoranda. The wear of jonrnals nnder heavy loads, or at high velocities, as well ae under ordinary conditions, is an important branch of thie subjeot. Wheu possible it ia desired that the dimensions of the journal, the maximnm, the minimum and the mean weight snstained, and the velocity of rubbing or number of revolutions per minute shonld he given. The natnre of the lubricant ia an essential element, and its composition ahonld he stated, the method and frequency of application and the quantity nsed sbould be given. When known, or readily ascertained, the coefficient of friction should be given. It should aleo be noted whether heating occurs, and under what circnmstances of pressure and velocity of rubbing surfacee. Peculiar instances of the hebavior, or nnneual expedients in the management of, bearings, if described accurately and concisely, will be accepted, with thanks.

Tbe wear of tools, under the various conditions of workshop practice, is another subject of inveetigation. Weigbing the toole carefully hsfore and after nee, and weighing the amount of metal removed will, perhaps, he found the most accurate method of determining the rate of abraeion. The area of surface finished, and the area of the surface cut by the tool ehould he accurately ascertained and stated.

The description of the tool, its shape, method of operation, the kind of metal used in the tool, the temper adopted, the character of tbe metal cut by it, the velocity of the tool, and where the peculiarities of behavior were noted, a careful statement of them should he given. This information will still be more valuable if the tool itself and specimens of the chips produced by it are furniehed. The power required to drive the tool can sometimes be readily determined, and such information is of value.

Prof. R. H. Thurston, of the Stevens Institute of Technology, Hoboken, N. J., is chairman, and will receive any communications.

Aiding Mechanical Helps.—There is an indirect benefit accruing to employers from "strikes," which is too little considered by either employere or employed. Every strike operates as a atimulue of the inventive faculty. Puddlers' atrikes and the interference of the nnion in the eternal economy of mills are compelling the adoption of mechanical puddling, not that any system is perfect yet, but some method will and must be fonnd that will take the plaoe of nncertain and capricious puddlers. The same is trne of nail feeders. No more sensitive, touchy olass of operatives live than nail feeders. They have fairly compelled mill owners to take off tbeir hats and say "hy your leave" in regard to their own property, but the late etrike at Wheeling has determined the mannfacturers to hsve a feeder they can depend npon. The Gould self-feeder at the La Belle factory is running regularly and successfully; is cntting abont six kegs of four penny nails per day, that being two kegs more than is neually cut in that length of time by hand-fed machines.

Steel vs. Inon Rails.—The *Railroad Gazette*, of New York, puhlishee a cut repreeenting the wear on a steel rail, laid down in 1865, on the eingle maiu track in Clark etreet, Chioago, already alluded to in these columne, where nearly all the trains of the Chicago, Rock Island and Pacific and the Lake Shore and Michigan Southern railroads passed over it, aud where engines were conetantly shifting. Iron raile in eimilar positions were renewed as often as once in six monthe, the steel rail having outworn sixteen of the iron rails. The steel rail was gradually worn down on one aide, but there waa no splintering, aa in iron rails.

Pure Iron.

It ie a popular notion that the purest iron is the best, wberess pure iron is too soft to be usefnl in the arts. It is snbject to ahrasion almost as easily as lead, and will yield so readily to the forces which iron is expected to resist that it is practically worthless. Therefore, it should be remembered that if by mixture such un artiole ls not obtaiued as may be wanted, the falt does not lie so much with the impurity of the iron as to the extent or proportion the impnrities may be introduced.

Another radical error prevails, iu tho helief that a process cau be adopted by which a good iron of commerce can be made directly from the ore, without the intermediate stages of being pigged, mucked, and piled or bloomed.

Does not every analytic chemist know that trequently two substances of auy entirely dissimilar nature iu their structural organization are exactly alike in their chemical constituents? —"one food and the other poison." Thue, sugar will nonish and build up the fatty tissue of the human system, wbile fusel oil will dissolve and destroy it. Yet hoth theee substances yield the same constituente in anslysis.

With these facts hefore ns, we are forced to the conclusion that the operative force and resistive power of a material of whatever kind dooe not depend eo much npon the nature of its elements as upon its molecular structure, which adapts it to certain purposes joet iu proportion as the porosity of that structure fits it for the action of surrounding influencee.

Tbns, the English procese of making first quality east-steel insists upon having the ingot in store twelve months before it is perfectly seasoned for first-rate merchant bar.

And thue the different preliminary processes in making wrought iron insiet npon time as well as manipulation to briug ahout that perfection so much admired in the iron of commerce.

Is it strange, then, that it is found difficult to produce a good iron direct from the ore by one operation? We thiuk not, and would like to hear from some of our practical readers on the subject.—*Cleveland Review.*

The New Carbonic Acid Motive Power.—Dr. H. Beirs, of Groeningen, has latcly written an exhuustive article on liquid carhonic acid as the successor of steam, in which he says: "For many years I have, with the collaboratiou of my brotber, who is director of the Netherlsnds' soda mannfactory at Amsterdam, considered the qusetion, 'How to tranepose heat into mechamical power more advantageously than it ie done in onr common steam and other enginea?' It occurred to me to make an experiment to see what degree the tenoion of the carhonic acid given off by *natrium bicarbonate* wonld amonnt to when heated in a close space. Wo were eurprieed and much gratified to find that when natrium carbonate in a dry pnlverized etate, or in watery solntion, is heated in a closed space, a part of the carbonic acid ie given off and condensed in a non-heated portion of that epace, so that, at a temperature of 3,000 or 4,000 C., liquid carbonic acid can be distilled out of thie salt with a tension of from fifty to sixty atmospheres."

Wire Rope for Conveying Power.—The use of u light endless wire rope running around grooved whesls at a high epeed hae proved a very useful method of transmitting power over long distances. The whole power even of a large wheel or engine can he thus led at pleasure up hill or down, across rivers or valleys, and in any direction. The rope need not be larger than an inch in diameter, even for very heavy work, ae the velocity of motion is very great while the tension of the rope is slight. The rope is mounted npon grooved pulleys or wbeels of large diameter in the samc way that ordinary helts are used, and the distance across which one span of the rope may reach ie from 300 to 500 feet. In case tbe total distance to be passed over ie greater than this, a second eimilar rope is used, extending on beyond the firet, and the third, or uutil the fartheet point is reached, even though it may be one or two miles from the starting poiut.

Steel castings are coming more and more iu uee every day, for a great many purposes. Many very heavy eteel caetings are now being made, which have taken the place of forged and cast iron; euch ae railroad frogs, engine cranks, croesheads, conneoting rods, eccentrice, hearings, cog wheels and other articles of heavy machinery, ae well as a great variety of emaller articlee used in the erection of steam engiues and other machines. They are epecially adapted to plowsharee, points, etc., from the fact that they can be heated and drawn out as wrought iron, and tempered to any degree of hardness and highly poliehed.

Street Railway Switches.—George T. Jacobs, of Waehington, D. C., bas invented an improved device for oporating etreet-railway switches, consieting of an adjustable and reverehle cam carried on tbe lower end of the operating ehaft ; said ehaft being provided with a steadying wheel, which traverses the track rail when the device ie in operation. The cam atrikes projecting luga on the switch point to properly ehift it.

Scientific Progress.

Uses and Properties of Salicylic Acid.

The *Scientific American* gives the following facts in regard to this new and important antiaeptic:

Salioylic acid is prepared from the oil of wintorgreen, the latter obtained from the *Gualtheria procumbens*, a trailiug plant common all over this country and widely know as tbe wintergreen, tea berry, partridge berry and deer herry, by boiling the oil for a few minntes with a solution of caustic potash; in this operation wood spirit is liherated, and on tbe addition of an acid ealicylic acid is procipitated. Tbus obtained, the cost of the substance has heen high. Although its existence has been familiar to chemists, tbrough its little or no utilization, it, in common with a very large uumber of other organic componnde, has boeu hut elightly known ontside of tbe laboratorioe. At the present time, however, .there is a prospect of the acid coming into wide general employment through the recent discovery of M. Kolbe, Professor of Chemietry at the Leipsic Univereity, that it can be fabricated from carbolio acid, which discovery has been already pnt in practice on a large scale by M. Van Heyden of Dresden.

M. Kolbe has found that, while salicylic acid can be produced from carbolic acid, it, on decomposition hy heat, regenerates tbe latter, and, further, it partakes, in common with carbolic acid, of the power of killing the inferior organisme which determine the phenomena of fermentation and of putrefaotion.

Salicylic acid is in fact a powerful antiseptic, and, from ite harmlessness and freedom trom odor and taste, sppears to he more valuable, iu a coneiderable degree, thau carbolio acid. Its properties are well showu in the following brief summary of M. Kolhe'e experiments: Beer yeast, which, ae is well known, determines the alcoholic fermentation of sugar, is totally inert on a solution of glncose to which one one-thousandth part of sulicylic acid has been added. Ground mnstard, when treated with tepid water, yields a strong piquant odor of mustard, hut becomes completely odorless if a emall portion of the acid he previously added. The acid also hinders emnlsin, or the ferment of sweet almonds, from acting on the amygdalin and trausformiug it into essence of bitter almonds.

A very small quantity of salicylic acid retards conaiderahly the spontaneous coagulation of milk. A quart of heer containing 15.4 grains of the acid and exposed to the air does not become sour, nor does the least vestige of the oryptogamic vegetation peculiar to spoiled beer ehow itself. Egga plunged for one hour in a solntion of the acid, and in no manner treated otherwise, were found perfectly fresh after three months' exposnre to the atmosphere. Meat powdered over with tbe eubstance ie prevented from spoiling for weeks. To prepare for nse, the meat is merely washed to disengage the acid, as the savor of the latter ie very slight and hy no means dissgreoable. This is a remarkably valuahle property, and one which will doubtless find profitable utilization in trausporting heef from Texas to the Northern States, or from Australia and South America to Europe.

Dr. Thiersch, of Leipsic, hss inveetigated the uses of ealicylic acid as applied to surgical dressings. When placed upon cancerous sores and ulcers in a powdered state, it hindere the putrid odor and produces no inflammatory symptoms. The impregnation of tow dressings and of bandages with the substance ie found to be attended with excellent results, though it is curious here to remark that the acid is absorbed and afterwards fouud in the urine. The application of the acid to treating contagious maladies, such as typhoid fever and cholera, has as yet not been made the subject of experiment; hut now that the propertiee of the substance have brought it prominently before the scientific world, there is little doubt hnt that the most extended investigatione into them will shortly follow. It ie already in uee in the eurgical wards of Roosevelt Hospital in New York City, as a dressing for wonuds, nlcere, otc., in the proportion of one drachm to sixty-two aud a half fluid ounces of water.

A Monster Steam Hammer.—According to a German paper the eteel works of Frederiok Krupp, of Eseen, are about to receive a very important addition to their maohinery. The largest steam hammer in uee at these works at the present time ie one capable of working a maes of steel fifty tons in weight, and erected at a coet of 2,800,000 francs. It ie now in contemplation to huild a new eteel hammer capahle of heating np a maes of steel of double the weight—viz., 100 tons. The new machine, it ie estimated, will cost 5,000,000 francs, and will he the moet powerful in the world, and it may be expected that the eize and weight of the German artillery will be enormously increaeed, as the new steam hammer will permit the working up of larger masses of metal than up to the preeent time hae been thought to be poseible by ecientific engineere.

The nnmber of persons who have arrivsd in thie State during the six months ending June 30th, has been 56,915, and the departures 27,818, leaving the State an actual gain 39,097 in population in six months.

The Oxy-Sulphur Light.

Oue of our exchangos gives the following acconut of the newly diecovered oxy-sulphur light and the method of making it:

We had a small eheet iron retort of the usual conical form. The delivery tube we loosely plagged to act as a safety valve, if necessary, and in the lid we drilled a hole and screwed four inchoe of quarter inch hrase tube. Through a hole in tbe side of this was inserted a piece of mnch smaller tube, closed by hammering the end, and having the closing pierced by a fine hole. By this arrangement we had the larger tube in communication with the retort and in the center of that tube, and rising a little higher than the level of ite mouth, a smallor tube coming oat at the side and long enough to euable a ruhber tube to be attached —an arrangement, in fact, very mnch like the ordinary form of blow throngh oxy-hydrogen hurner. A quantity of salphur was placed iu the retort, aud sufficient heat applied to raiee tbo temperature to ahout 725° Fah., the point at which it vaporizes. The end of tbe smaller tnbe was attachod to the oxygen bag—one containing four cuhio feet—snd a fourteen pouud weight applied, which was found amply. eufficient. When the vapor of aulphnr made ite appearance, the oxygen wae turned on, and the reeult was a steady flame of abont two inches iu length, and of such intensity that, although we had not an opportunity then of tryiug it, we are sure a emall statuette could have bsen photographed hy it in a few seconde. The product of comhustion—eulphurous acid—may easily he got rid of if there be in the room a suitable cbimney; hnt even without that, there ia no difficulty in readering it so harmless tbat the operation may be carried on in a drawing room.

Dana on Darwinism.—Professor Dana, of Yale, is not a Darwiuian, or he is not in full sympathy with Darwin'a views. He says: "Tbere is no qucstion, *first*, that geological timo has heen of vast length; *second*, that there is an historioal order in the rocks of the globe, and that the process of tbe world's creation may be, to a large extent, read in the rooks; und *third*, that there bas been a system of progrese in the earth'e living species from the eimpler forms of earlier time to man. But, while adopting these conclnsions in eommon with all geologists, I have no faith in the Darwinian echeme of deriving man through gradual development upward from the monkey, or of evolving a system of life through 'natural selection.' I deplore the misuse of science in tbe support of materialistic views, not uncommon among those who adopt the Darwinian hypothesis. At the same time I grieve, for the eake of the bible and religion, that the discussions relating to scientific views aud men should he so often interspersed with abusive epithets, and so often presented by those who are ignorant of the sciences they are attempting to set right."

Change of Color in Animals.—Certain animals possesa the power of changing their color at will, or according to the circumstances in which they are placed. This is convincingly ehown in some rscent experiments made hy M. Pouchet, a French investigator. He chose as his subject the *Palæmon serratus*, a species of prawn or crub. These prawns, when brought ashore hy the fishermen, have a rose or dark lily color; but if they are put into porcelsin vessels with black or white hottoms, they will assume colors wholly unlike. Those in the white dish bscome yellowish, almoet colorless, as if they had just ehed their skin; those in tbe dark colored dish aseume a browuish red hue. If they are ohanged, the pale into the black vessel, and vice versa, they again alter their color, in corrsspondence with their snrroundings. The change of a pale one to a dark tint was more rspid than the reverse. Thus, under favorable circumstances, a yellow, red, or rose-colored *Palæmon* oan be created.

A Lady Lecturer on Chemistry.—Scotland bas produced something of an anomaly in the person of a lndy lecturer on chemistry. Miss Charlotte Napier lately gave a lecture on chemietry, in connection with the Blackfriars Ueeful Information Society of Aherdeen. There was quite a full attendance, and the lectnre was illuetrated by a variety of experiments, pronounced of a highly interesting and inetructive character, wae lietened to with the closest attention, and an enthnsiastic vote of thanks wae voted to the lecturer at the oloee. Miss Napier is quite a young lady, a native of Aherdeen. Sbe studied chemietry at Edinhurgh, under the direction of Mr. Falconer King, with tho view of assisting her father ae an agricultural chemist.

A Parasite in the House Fly.—Profeesor Leidy reports the ohservation of a thread worm in the prohosois of the common house fly. The parasite is from a line to the tenth of an inch in leugth. From one to three were found, on an average, in one fly out of five. Mr. H. J. Carter first diecovered the parasite in tbe houee fly of Iudia, and deecribed it under the name of *Filaria muscæ*. From two to twenty were found by the observer in one fly out of three. Dr. Diesing hss referred the paraeite to a new genns, with the name *Habronema muscæ*. It has heen suggested by Mr. Carter that it may be the sonroe of the Guinea worm (*Filaria medinensis*) in man.

The Mining Share Market.

Although stock matters were pretty dull during the first part of the week, they are beginning to "pick up" a little at the latter end. The market has strengthened materially, and appearances indicate that the advance is from legitimate causes, as lesding brokere are buying largely on orders from their customers. It is stated that the orders from the country, from over the mountaine, and from the outeide public generally, are more numerous than they have been at any time since last spring. On Wedneeday and Thureday there was some little excitement, stocke heing run up a little. It was thought that the hull tactics were instigated by the heavy ringe, which had reason to fear that the market might tumhle with a disastrous crash in consequence of the nneettled condition of financial affaire in the Eaet, growing out of the heavy hanking enepensione, and hy huoying the msrket and giving it a fictitions appearance of etrength the immediate danger would he averted, and the market eettle back to its natural groovee after the crisie should have paesed. Most of the stocks showed a slight advance on Wednesday over Tueeday's quotations. The prices for different stocke for each day during the paet week will be eeen hy referring to our stock sales.

NEW DIGGINGS.—A correepondent of the Yreka *Union*, of July 24th, sends the following items from the South fork of Salmon: Thos Hand, Williams & Co. (Hand and Williams are lately from Oro Fino) have etruck good pay dirt, which paye from $8 to $10 to the hand. The claime are hill claims or on the eecond hench of the river. They are working to a great disadvantage now, in fact, only prospecting the ground. Theee claims are extensive and will last for years. The owners are only juet getting into pay dirt, and will do muoh hetter when the claims are better fixed for working.

MINING STOCKHOLDERS' DIRECTORY.

Compiled every Thursday from Advertisements in the Mining and Scientific Press and other S. F. Journals.]

MINING SUMMARY.

THE following is mostly condensed from journals published in the interior.in proximity to the mines mentioned

California.

ALPINE.

FLINT COMPANY.—Alpine *Chronicle*, July 17: Under this name a company has been organized at Detroit, Mich., for the prosecution of a mining enterprise at Monitor. Mr. Eldredge, of Detroit, has arrived at Monitor to superintend the company's business. A shaft will be sunk to a depth of 500 ft on a claim recently purchased by the company. Work will be commenced on Monday next.

AMADOR.

CRUSHING.—Amador *Dispatch*, July 24: The Volunteer mill commenced operating five stamps last Tuesday morning. The other five stamps will be put in operation as soon as circumstances will justify it. The rock now being crushed looks to be very rich, but what per cent. of the recions metal it will yield is not yet known.

BUTTE.

SAGAMORE.—Oroville *Mercury*, July 23: Mr. Vail, of Forhestown, showed us a let of rock taken from the Sagamore ledge that is now being worked, that was full of gold. He informed us that it would run as high as $1,000 to the ton, and that they had some 50 tons of it already out with a good ledge before them. They are now running both mills, the five stamp and the ten stamp, and are doing as well as they could expect. The company have paid up every debt, have the two mills, have just ordered a Paul's process which cost $5,000 and have paid for it, and now have money in the treasury. Not a cent has been expended that did not come ont of their mins. The controlling interest is owned hy a few men at Forbestown, who have worked hard, but are now on the surs road to wealth. They will work on with the present machinery until they get fands snough ahead to build a large mill, and then if the rock continues to pay as well as at present they will build additional works.

NEW PIPE FOR DUTCH HILL MINES.—The North Fork mining company have purchased another pipe for their hydranlic mines at Dutch hill, which will be laid alongside of the present one. The pipe will be shipped there this fall, and will be laid early in the spring.

COLUSA.

FINE ORE.—Colusa *Sun*, July 24: John F. Fouts brought in this week a fine specimen of cinnabar, from the Bedford mine, located on Big Stony creek, near Fouts' springs. He says the company have plenty of it.

CALAVERAS.

UPPER COUNTRY GLEANINGS. — Calaveras *Chronicle*, July 24: The result of 61 tons of ore from the Lewis & Farchild mine, near Leavitt's ranch, was increased by the blanket washing to $2,791.39, or nearly $46 per ton, instead of $2,670 as stated in last week's issne. The previous crushing of surface ore from the shaft yielded $1,526—abent $30 per ton—proving that the ore is not alone stronger in depth (2½ ft at 70 ft deep) bnt that it is also gaining in richness. Working expenses have been merely nominal so far, and to judge by the extensive oropping of the pay ore, 700 linear ft, will continue so for a long time. This lode can he easily traced for nearly 2 miles. Conrse, 35 deg. west of north; dip, 55 deg. east. Slate constitntes the footwall; laminated marble, apparently, the hanging wall. The old Valentine, which afforded pleasant quarters to ground squirrels and wood rats for years, is jast now the object of tender solicitude to several San Francisco parties who all claim to be the legal owners. San Bruno continues to yield very healthy looking ore and plenty of it. A shaft hss been commenced by contractors on the Ashland, first south extension of the Lewis & Fairchild mine. The lode here orops boldly again for some distance, exposing low grade ore 2½ ft in width.

TUNNEL COMMENCED.—Emerson, proprietor of the Happy Valley hydranlic, has commenced running the hedrock tunnel necessary for the proper working of his claim. He will have it completed and everything ready for piping with the advent of the deluge, which every miner confidently calculates upon next fall.

INYO.

AFFAIRS AT PANAMINT.—Panamint *News*, July 21: The hearts of Panaminters, which had become somewhat despondent of late, were made glad on last Tuesday by the arrival of Senator Stewart, S. L. Jones (brother of the Senator) and Duff Green. They had been in the camp but a few hours when an order was given to their foremen to set seventy or eighty miners to work in the mines. About fifty were all that could be found here at present, many of those discharged but a short time ago having gone ont prospecting here and in neighboring districts. Word has been sent over to Darwin, and undoubtedly a number will respond in a few days. In an interview with Senator Stewart and S. L. Jones we learn that it is their intention of concentrating their forces for a vigorous prosecution of work upon the Wyoming and Hemlock mines. A shaft 1000 ft deep will be sunk on the Wyoming, and if the ledge holds out as strong and rich at that level as it now is at the 300-ft level, a tunnel will be started, about on a level with the mill, to tap the ledge about 300 feet helow the croppings. With a Burleigh drill this tunnel can hs run within a period of four or five months, and, when completed will greatly facilitate the working of the mins. It will do away with the necessity for the tramway, ths packing of water over a long trail to the top of the mountain, and the workmen, instead of living upon the top of the mountain, where it is cold and unpleasant in winter, can enjoy themselves in comfortable cabins in town. S. L. Jones, who is Superintendent of the Crown Point mine, Nevada—and probably the best practical miner on the coast—was very enthusiastic over our mining prospects, after a thorough examination of the mines. He says that we have a much better showing than had Virginia City at the same period after her discovery. He thinks Panamint will soon rank next to Virginia City as a wealthy and prosperous camp.

MONTEREY.

QUICKSILVER.—Monterey *Democrat*, July 24: Most of our readers are aware that rich deposits of quicksilver exist in the northern part of San Luis Obispo county, among which the Oceanic mine, not far from Cambria, is the most noted.

The distance from the quarter indicated to the San Antonio country being, in a direct line, inconsiderable, and the mountain trsot intervening being identical in external figure and formation, it might he presumed that whatever minerals were found in the one would be discovered in the other. Acting on this presumption, this mountain range below San Antonio and in our county, called the "Santa Lucia range," has been diligently prospected, and we now report, as resulting therefrom, what promiss to be valuable quicksilver mines, and to add largely to the importance of the district in which they are located.

H. C. Dodge and others, residsnt at Jolon and in its vicinity, are now opening a mine, located between San Antonio and the coast, that affords a fine prospect. They have driven into the mountain two tunnels, one one hundred feet and the other fiftesn feet, finding "kidneys" of the metal that are almost pure, and a ledge, or vein, thirty feet wide, which will yield at least three per cent. In the vicinity wood and water are plenty, and, at small expense, roads will give an outlet to the sea or to San Antonio. The sandstone formations that accompany the cinnabar are the same as at the Oceanic mine, with which there is evidently a direct geologic connection.

This district, as has long been known, contains gold, and in quantity sufficient to pay whenever there is water enough to use the rocker. It is "placer" gold or drift gold—that is to say, as far as we are informed, quartz ledges containing the precious stuff have not been found. If the quicksilver mines prove valuable the gold diggings will, doubtless, receive their share of attention.

NEVADA.

HOWARD HILL MINE.—Grass Valley *Union*, July 25: Accepting the invitation of President Becker and Superintendent, Capt. White, quite a delegation of the business gentlemen of Grass Valley visited, Friday, the Howard Hill company's grounds and works to witness the formal "starting up" of the company's mill. The mill, as a whole, is one of the most compact and economically arranged structures of the kind it has ever been our fortune to visit. The batteries are in perfect condition—the stamps, which weigh 1,000 pounds each, dropping at the rate of 70 times per minute. This rapidity of motion insures the reduction of about 30 tons of ore for the 24 hours. It is thought it will not be difficult to keep the mill well supplied, as the mine makes a liberal exhibit of ore. At the 3d level the ledge is opened up for 150 ft, with an average of 6 ft in width. The ledge in the lowest, or 400-ft level, exceeds expectation both as to size and superior character of the ore. The energetic and skillful superintendent is pushing forward the most thorough development of this valuable property; and it is his openly expressed opinion, emphatically sustained by his sub-officers and intelligent employees generally, that within 6 months the Howard Hill will take first rank as a dividend paying gold mine. This assurance is based upon the fact that the ledge is a very large one—the ore is cheaply raised, is easy of reduction and of full average quality, with every reasonable prospect of future improvement. At the hoisting works we found the same characteristic neatness, order and efficiency. We observed a large supply of fael on hand and 8 or 10 teams adding to the quantity.

SANTA BARBARA.

THE LOS PRIETOS MINES.—Santa Barbara *Index*, July 17: The first run of ore from these mines in the new furnace proves that they are rich. The furnace was defective in draft and in other particulars unsuited to the peculiarly rich ore of these mines. Work is going on upon a furnace of a different character which it is expected will be much better adapted to the treatment of these ores. The construction of the furnace already tried will be materially changed. Every well known mine of cinnabar has had to undergo many experiments before the best mode of treatment was discovered. They all differ in character, and require a different treatment. The development of the Los Prietos mines goes right along, and every preparation is making for thorough exploration and for the treatment of the ores in the most successful manner that mind, money, experience and labor can bring to the work. The Los Prietos mines, of Santa Barbara county, now take their place in the catalogne of the great quicksilver mines of the world.

Nevada.

WASHOE DISTRICT.

YELLOW JACKET.—Gold Hill *News*, July 22: The flow of water on the 1840-ft level is yet too strong to allow of the resumption of work in that portion of the mins. The south winze, below the 1740-ft level, is down 102 feet, with a slight seepage of water coming in. The face of the southeast cross-cut on the samo lovel is in soft porphyry and quartz.

CHOLLAR POTOSI.—Sinking the main incline below the 1350-ft station at the old works goes steadily forward, the bottom still in hard blasting ground. The 1350-ft station is completed, and a drift in a distance of 35 feet, the face in hard blasting porphyry. The extraction of ors from the old upper workings has been temporarily suspended for the present on account of inability to get it hauled from the damp as fast as it is extracted.

CONSOLIDATED VIRGINIA.—Daily yield, 600 tons of ore. No important changes in any of the ore-producing levels during the week. The mills are all running steadily as usual. The ore-bresats are being extended to the southward on the 1500-ft level, the ore still retaining its usual rich quality. Cross-cuts east and west, on the 1550-ft level, are being made in the ore body immediately under winze No. 1. The ore in the face of both these drifts is of exceeding richness. The hullion product still shows a strong increase over that of last month. Everything in and about the mine is working finely, and there seems only prosperity and success ahead.

BELCHER.—The usual amount of ore is extracted daily, and the ore breasts throughout the entire mine show but little, if any, change. No ore has yet been extracted from the openings on the 1500-ft level. The extraction of ore from this portion of the mine will be commenced as soon as the north drift on the 1500-ft level has made connections with the Crown Point mine for ventilation purposes; this drift has yet only about 25 feet to run.

ORIGINAL GOLD HILL.—The development of the fine ore body in the south mine, by means of the two cross-cuts into it, goes ahead well, and an important showing is being made.

NEVADA.—Cross-cutting is discontinued, and the drift is now following the main lead itself. Good streaks of ore are found which give good assays, but still better ore is expected to be developed.

OPHIR.—The usual amount of ore has been extracted daily, for the past week, until this morning, when the whole of the ore extraction and prospecting on the lower levels of the mine was stopped, and the works shut down, for the purpose of repairing the main shaft.

CALEDONIA.—Sinking the old incline shaft will be suspended to-morrow for a day or two, for the purpose of putting in a new hoisting cable. Sinking the new shaft is rapidly advancing downward, the rock blasting out finely, the flow of water still continuing strong. The erection of the new building is about completed. The erection of the heavy hoisting and pumping machinery is going steadily forward.

UTAH.—The shaft is cleaned and thoroughly timbered to the bottom, ready to resame sinking. The drifts and cross-cuts on the 400-ft level have been cleaned out and repaired, ready to resume full operations. The new pumping and other machinery is working with satisfaction, and arrangements are being rapidly completed for lowering a powerful 10-ton sinking pump as fast as the shaft is sunk.

CALIFORNIA.—The north drift on the 1550-ft level is again being driven forward, the face still in rich ore. This drift has been advanced 25 feet. On the 1500-ft level cross-cuts Nos. 5 and 6 are being pushed ahead, the face of both still in good ore. The new mill is being pushed to completion with all the energy possible.

UNION CONSOLIDATED.—Work on the 1300-ft level is stopped for the present, on account of repairs to the Ophir shaft.

IOWA.—Sinking the shaft is making good headway, the rock in the bottom being a little tough and hard, but not enough so to impede the headway of work. It is down 365 ft. A short drift has been run westward to the ledge, which at that point is solid quartz, is large, well defined and of a very encouraging nature. The ore assays from $8 to $15 per ton.

BULLION.—The incline shaft at the old works has been cleaned out for 80 ft below the commencement of the incline, which carries the workmen nearly through the worst of the work, so that it will not take long now to reach the 1400-ft level.

DAYTON.—The erection of the hoisting engines is so far advanced that it is now confidently expected that everything will be in readiness to start up by the first of next month.

SIERRA NEVADA.—There is but little change in the material encountered by either the north or south drifts on the 700-ft level of the old shaft during the week; both are making good progress.

NIAGARA.—Sinking the main incline shaft is making splendid progress, 25 ft having been added to its depth since our last report. The ore vein is showing finely, and it will not be long now before a sufficient depth will be attained for the opening of the first level, for a better development of the ore vein. The new hoisting machinery is working with the utmost perfection.

IMPERIAL-EMPIRE.—Preparations for opening out the ore body lying between the 1850 and 2000-ft levels are making steady and rapid progress.

CROWN POINT.—Daily yield of ore, 500 tons. The mills are all running, and there is little or no change apparent in the ore producing sections since our last visit. Prospecting the 1600-ft level has produced no important results. The main east prospecting drift on the 1700-ft level is steadily advancing toward the ore vein, the heat being intense and the progress slow.

GLOBE CONS.—Prospecting on the 250-ft level still continues with unabated vigor. The flow of water at the 200-ft station continues stronger than the pumps are able to manage.

LEO.—Sinking the winze below the main tunnel level, following the pitch of the ledge, is 182 ft deep to-day. The ground continues to work well. The ledge is running pretty flat, and is showing great strength. The whole bottom of the winzs is now in a heavy clay wall; the clay is of a dark blue color, and carries seams and bunches of quartz of the Comstock character. The prospects continue promising.

COSMOPOLITAN.—The mine is now in good working trim, and considerable ore is being extracted from the stopes, which are looking exceedingly well. The ledge in the face of the main tunnel northward, shows great improvement the last few days, over half of it being ore of more than average richness. It is being taken out for milling, and the Hope mill will be started up in about a week.

AMAZON.—The winze below the first station level has reached a depth of 20 ft, at which depth the assays show a decided improvement in the character of the ore vein.

GOULD & CURRY.—Cutting out and repairing the rotten timbers at the point where the recent cave occurred is going steadily forward, although, many of the timbers being very rotten, great care has to be exercised in the work.

JULIA.—Driving the main south drift on the 1000-ft level is making steady progress, the face in soft working ground. Sinking the main shaft is being crowded with all the energy possible.

LADY WASHINGTON. — The pump-bob and other portions of the massive new machinery are being placed in position. Next week the old machinery will be started up to pump out the 260 ft of water now in the shaft, preparatory to putting in the large new pump.

LADY BRYAN.—Sinking the shaft is going ahead rapidly. The face of the west cross-cut on the 380-ft level is still in a fine character of quartz.

HALE & NORCROSS.—Cutting out for the new station at the 2200-ft level is going ahead as usual. A drift will now be started south from the bottom of this winze to connect with the main incline for air purposes.

BALTIMORE AND AMERICAN FLAT.—The most of the week has been consumed in necessary retimbering and repairing of the drifts on the upper levels, so that no new or valuable ore developments have been made during the week.

ROCK ISLAND.—The shaft is down 100 ft below the 450-ft level, at which point a new station is being opened for the 550-ft level.

NORTH CONSOLIDATED VIRGINIA.—Sinking the main shaft is going ahead as usual. The addition to the hoisting works building for the reception of the new machinery is nearly completed.

SAVAGE. — Sinking the main incline goes steadily ahead without change or interruption

OVERMAN.—The pump has been lowered the 1100-ft station, and the water is fast being drained from the bottom of the shaft. The entire machinery of the mine is in splendid [illegible] ing order.

SUCCESS.—The main west drift at the [illegible] level is showing considerable more [illegible] the face, and the prospects of yet [illegible] body of pay ore on this level are looking [illegible]

WOODVILLE CONSOLIDATED.—The entire [illegible] in the shaft is now concentrated in cha[illegible] out for the head of the incline, which is [illegible] ready to be commenced.

SILVER HILL.—The shaft is down 415 [illegible] rock in the bottom still being quite hard, the sinking making good headway. The [illegible] in the face on the north drift on the third station level is again looking very favorable for ore developments.

EUREKA.—The new hoisting works are covered in, and everything is working with the utmost perfection.

BEST AND BELCHER.—Cutting down the grade between the Gould & Curry and Best & Belcher drifts on the 1700-ft level is going steadily forward. The heat is very intense, and the progress necessarily very slow.

BROOKS.—The shaft is down 85 ft, the bottom still in quartz, and ore of a fine character. The prospects of the mine are daily strengthening. Preparations are under way for the erection of good steam hoisting works.

SOUTH CALIFORNIA.—The bottom is in good working ground, with streaks of quartz from which excellent assays are obtained.

NORTH CARSON.—Material in face of main drift still soft, and giving good assays from frequent quartz seams and feeders. The main ledge is likely to be cut into at most any time now.

PROSPECT. — Driving the upper tunnel is making excellent headway, as is also the sinking of the new shaft.

NEW YORK CONSOLIDATED.—The mason work for the new machinery foundations is being pushed forward to completion as energetically as possible.

BUCKEYE.—Putting in the new machinery is being pressed to completion with all the energy possible.

MEXICAN.—All work suspended on account of the shutting down of the Ophir mine.

A Great Gravel Mining Enterprise.

The opening of the extensive hydraulic mines near Auburn is justly considered the beginning of a new era in our growth and prosperity, and is, therefore, deserving of more than a passing notice. To give a condensed history of the enterprise up to the present date, it is necessary to go back about four years. At that time J. B. Hobson, fully convinced of the inherent agricultural value of this foothill country, came among us with a view of securing a homestead in this section. On looking over the country he became favorably impressed with a tract of land lying about three miles northeast of Auburn, and at once entered into negotiations with the railroad company for the same. Mr. Hobson settled, with his family, on this land, and immediately began extensive and costly improvements, by way of building, fencing, clearing, etc., with a view to its agricultural development. On this tract of land are deep beds of washed gravel and high gravel hills. These beds were known to contain gold, but so far as prospected, the precious metal had never been found in sufficient quantities to pay up the ordinary process of drifting; and lying, as they do, above the Bear River ditch, the source of water supply for this section, the idea of ever working them by hydraulic was, doubtless, by former prospectors, considered out of the limit of modern probabilities, and sequently they were abandoned. Mr. Hobson had been but a short time on the place before discovering the richness of these deposits, and noting their great extent. In viewing and studying the matter closely he soon conceived how water might be got on the ground with sufficient pressure to work these deposits by hydraulic, the accomplishment of which he felt sure would, besides opening up a new and extensive industry, insure to his individual success. Accordingly, full of faith that he could direct capital to the accomplishment of the work in the near future, he set himself to the task, first, of securing from the Government a mineral patent to the land. This done, he embraced every opportunity to direct the attention of capitalists to the enterprise. Some manifested sufficient interest to send engineers to decide on the plausibility of Mr. Hobsen's previously conceived plan for bringing water in, but in each instance they pronounced it impracticable. It embraced a new feature in hydrostatic engineering.

There is no high country near the claims on which water could be brought in open ditch, delivered in a box, and run down a hill through pipe directly on the ground, in order to secure pressure, as is commonly the case. The nearest eminence on which water could be brought in open ditch that would give sufficient pressure, was two miles from the mine, and what was worse, between that point and the mine lay two deep canons. The project necessitated bringing the water this two miles through pipe which must, of course, form on its line two inverted syphons, and deliver the water on the to of the second eminence direct from this main pipe. As no similar project now exists, so far as is known, in the world, it is not surprising that even good engineers were slow to say that the undertaking could be successfully accomplished. On the 5th of last March Mr. Hobson went to San Francisco and succeeded in inducing his friends, W. T. Higgins, James Cannon, P. Growley and Charles Gelton, to join with him in an attempt to develop these mines. These gentlemen sent Hale, experienced miner to prospect the ground, ...do... to satisfy themselves more fully of its Just qualities, provided the project of bringing Kentucky could be made a success. The Meadow's report was not only favorable, but New Yo Thus re-assured, they formed themOphir... ...do... to a company styled "The Auburn ...ining and Ditch Compauy." They ...do... Rock I. the eminent engineer, Herman Ray & r, and offered him an equal interest, Silver, r, proposition that he would overcome the difSaxarition of getting in the water. He, on lookSier of the ground, decided at once that the ...rk could be successfully accomplished. After making such arrangements with the owner of the Bear River ditch, G. W. Reamer, as would insure them an ample supply of water, Mr. Schussler made the survey, which was completed on the 15th of last April. Without loss of time they advertised for proposals for doing the various branches of work. The contract for cutting the ditch, two miles of pipe ditch, and three miles of open water ditch was let to Sam Lock, the contract for furnishing the pipe, to Curry, of San Francisco; and the contract for cutting a 300 ft tunnel, to Neilson Graham.

The rest of the work fitting up the claim, putting in the ground sluice, building eighty rods of flume, etc., was done by men hired by the company, directly under the supervision of J. B. Hobson, Superintendent of the whole works. On the 18th of May the first blow was struck, and on the 25th day of July, just sixty-three days from the start, the work was all completed and everything ready for operation. The work, as completed, is as follows: First, the water is taken out of Bear River ditch near Clipper gap, some 5½ miles, or 1,760 rods above the claims. It is carried through an open ditch, including 80 rods of flume, 1,160 rods. The water then falls into a sand box, 8x20 feet and five feet deep, which is constructed with gratings, partitions, etc., for catching drift. Then into the main pipe, twenty-two inches in diameter, made of Nos. 11 and 12 iron, down a steep hill and across Dry Creek canon, which is 360 feet deep. Then over the divide between Dry creek and Lovell's ravine, 280 feet deep. Then up an incline from Lovell's ravine to the diggings, discharging the water under a pressure of 176 feet, registering on the pressure gauge seventy pounds to the square inch. The whole length of pipe is 10,500 feet. This pipe is put together with rivets, coated inside and out with asphaltum, and buried beneath the ground, and is said to be good for one hundred years' wear. At all high places in the pipe are automatic vacuum valves, which discharge of their own accord all accumulations of air in the pipe, thus preventing the spitting at the discharge, which is sometimes common. At the end of this main pipe is a cast iron distributor, designed by Mr. Schussler, and made especially for these works. It is a novelty in itself, and the only one of the kind in existence. By it at least twenty-five per cent. of pressure is claimed to be saved. From this distributor are at present two 16 inch pipes, laid up the side of the hill 300 feet to the giants where the water escapes, to spend its force against the auriferous bank through two nozzles, one three and one-half inches in diameter, and the other four inches in diameter.

The tail sluice, 1,250 feet long, on a grade of eight inches to twelve feet, is paved with pine blocks, with occasional iron riffles. On the line of the sluice are two undercurrents, constructed with all the latest improvements for saving gold. As we stated in a former article, when the water was turned on everything worked like a charm. Of the cost of this undertaking we have not been informed, but it evidently involved the outlay of many thousands of dollars. One thing we can say without much fear of contradiction, that in the county there was never so much work done on a mining enterprise in the same length of time. To the indomitable energy and perseverance of J. B. Hobson, in securing the development of this enterprise in our midst, is due unbounded praise; to the established engineering skill of Herman Schussler in making the undertaking, mechanically, a success, is due respect and admiration, and to the gentlemen who had sufficient nerve and speculative enterprise to risk their money in the undertaking is due our earnest desire that the enterprise may prove eminently profitable. To the driving character of J. B. Hobson, and the efficiency of J. H. Neal, foreman of the laborers on construction; John Tyler, foreman of laborers on ditch; Fred. Pretorions, foreman of boiler makers; John Simons, foreman of miners; and C. H. Hicks, boss carpenter, is due the credit of the well and speedy completion of the whole work.—*Placer Herald.*

New Method of Making Mortar.

So very marked is the mortar used in modern building as poor, compared with that used in ancient times, that various attempts have been made to ascertain the "secret," if secret it was, of the composition of the old builders in mortar making. One "secret" which the old builders possessed, we may quietly here impart to those of the present day, that is, to make good mortar, good lime and good sand must be used; the old builders did not use sand unfit to be used, as do the builders of the day oftentimes. When we examine almost any piece of modern work, we find that the mortar hardens very slowly, and even when it has become fully hardened, it crumbles away, loses cohesiveness, so much so that in many cases it is quite an easy matter to detach the stones or bricks from one another, and from the mortar. The very opposite characteristics are found in ancient work, and on examination it has been seen that the mortar has in great part been converted into silicates, entering into close union with the particles of quartz. It is to these silicates that mortar owes its firmness, and it is to the slowness with which silicates form in modern mortar, and small proportion of these present in it, that this owes its poverty. A method of setting free the silicious earth, and promoting the rapid formation of silicates, has been discovered by Prof. Artus, and which yields a mortar resembling in its characteristics those of the ancient kinds. The great recommendation the process possesses, is its simplicity. Lime is in the first instance well slacked, and carefully mixed with finely sifted sand; to the mass is added a quantity of unslacked lime to the extent of one-fourth of the sand in the first instance mixed with the slacked lime; mix the whole thoroughly, the mass heats and the mortar may be at once used. When the mortar is not wanted for immediate use, the first process only is carried out, namely, mixing the sand with the fine slacked lime; when wanted for use the unslacked lime has to be added. A very strong mortar is said to be the result.

THE BALANCE WHEEL.—If the balance wheel of a chronometer should revolve on a plane, in a straight line, with the same velocity it has in the chronometer, it would travel in one second 17.1 inches; in one minute, 85.3 feet; in one hour, 5,118.7 feet; in one day, 23.27 miles; and in two years three hundred and thirty-seven days and twelve hours, the circumference of the earth, or 24,856 miles. These results are based on the measurement of a balance wheel from the American Patent Pocket Chronometer, manufactured by Charles Fasoldt, of Albany, N. Y.

IN the Lady Bryan mine, on the Comstock, for the purpose of making a much more speedy development of the lower levels of the mine, all work has been suspended for the present, except that of sinking the main shaft, and running the main south and west drifts on the 380-ft level.

Destruction of Northern Forests.

The disposition to destroy the forests of the country is generally admitted to be a peculiar trait of the Yankee character, but it is evident that Great Britain is becoming alarmed about the encroachments of the lumbermen on her timber possessions in North America. The London *Farmer*, of June 21st, contains an article on this subject, from which we give the following:

"Canadian forests are in danger of being entirely swept away before advancing agriculture. Busy emigrants and native Canadians clear away the timber off hundreds of thousands of acres annually throughout the Dominion, and it is greatly to be feared that the result will be a considerable alteration of the climate through the process. The wholesale destruction of forest trees may result in a series of extremes of drought and flood, instead of an equable and continued amount of moisture. MM. Fantiat and Sartiaux recently communicated to the French Academy of Sciences the results of some carefully conducted experiments on the influence of forests on the hydrology of a region. MM. Fantiat and Sartiaux make their observations: (1) above the forests; (2) at the same altitude, and at so small a distance from the forest that any observable difference could be attributed only to the influence of the latter. In the heart of the forest of Halatte, at a height of 20 feet above the trees, a pluviometer, a psychrometer, maximum and minimum thermometers, and an evaporometer were placed, and similar instruments under the same conditions were placed in the open air at a distance of 300 metres from the forest. The result for six months of 1874 were as follows:—Amount of rainfall—in the forest, 192.50 mm.; in the open, 177.00 mm. Degree of saturation of air, in 100ths—In the forest, 63.00; in the open, 61.7. These gentlemen come to the conclusion that "if these observations, which are still made daily, continue to give the same results, it may then be affirmed that forests constitutes vast condensing apparatus, and the conclusion will be inevitable that more rain falls in wooded land than on bare and cultivated soil." In the United States the preservation of the forests has become a matter of national importance, and every encouragement is given to creating plantations and their judicious distribution all over the country. In the older districts of Canada the forest is almost entirely swept away; and the evils recognized and deplored in the States are, it is said, in these quarters of the Dominion also issuing in decreased moisture and impoverished lands, in destructive floods and equally destructive droughts. The *Toronto Globe*, in drawing attention to the fact, says: "It would be a curious commentary on the boasted intelligence of the present day, and its enlightened zeal in subduing the earth for the purpose of securing the greatest possible productiveness, if the very eagerness with which this object is pursued should issue in extensive districts being reduced to deserts, and in others being rendered less suitable for maintaining a large, prosperous, and healthy population."

GLAZING FOR POTTERY WITHOUT LEAD.—The poisonous nature of lead glazing for pottery is well known, and serious and fatal accidents from that source are not uncommon. For this reason several preparations for this use have recently been devised, in which lead does not enter. Among others, the following is given as something superior to any hitherto used to supersede the poisonous lead glazing: Constantin, of Brest, made last year a glazing of pulverized quartz, red lead, and silicate of soda, (water glass), which he guaranteed would withstand vinegar; but the Paris *Societe d'Encouragement* induced him to experiment on compounds without lead, and now he publishes the following prescriptions: No. 1.—100 parts silicate of soda of 50° Reaum., 15 of pulverized quartz, and 15 of chalk. No. 2.—100 parts of silicate of soda, 15 of quartz, 15 of chalk, and 10 of borax. The borax makes the compound more expensive, but in return makes it easier fusible, so that the glazing may be done at a lower temperature, while at the same time the glazing is harder and possesses more luster.

PORCELAIN.—The modern porcelain of China compared with the antique wares, shows the art has much declined The biscuit is not so white and pure, and the glaze is rougher. The colors, too, are less bright. The materials employed now are clay, quartz, steatite and glaze. The whole of the modern Chinese ware is made at King-teh-Chen, where the potteries were first established about 900 years ago. At present there are about 120 furnaces employed—about half the original number. Of the enamels, the cloisonne is still made at Pekin; and the enamels bear comparison with the ancient. Some of the best designs in effective specimens of hand, not molded work, are very artistic. A lady, Miss Barlow, in Staffordshire, has excelled in *sgraffito*, ornamented designs in gray clay. The colors of the designs being turquoise, violet, blue, olive, green, etc. The mode of firing and the material adopted rendered the tints mottled and more artistic. Lavatory fittings constitute a branch of pottery formerly quite unknown. Two kinds are known. The brown glazed stoneware and queensware.

THE Fruitvale horse railroad will be in running order by the 1st of September.

The Plane.

This instrument, when well made, and kept in order, surpasses, in accuracy of performance, all other hand tools. Originally furnished with only one iron, the plane now has usually two, the uppermost for cutting the shaving, the uppermost for breaking it in such a manner as to prevent it acting as a lever in lifting or tearing up fibres, in front of the cutting iron. In England the *stock* or body of the plane is generally made of beech; but on the continent apple and pear are frequently substituted with happy results. Through the stock is a vertical aperture, of which the lower portion acts as a guide to the cutting edge, and forms together with this latter the *mouth* of the plane. This effectually regulates the depth to which the cutting iron can penetrate, but it would not be sufficient to prevent it from following the inequalities of the surface to which it might be applied. This would utterly unfit the plane for the purpose for which it is intended; hence, this tendency is overcome by giving considerable length to the stock, which causes a plane in operating on a rough piece of wood, to remove successive shavings from the more prominent parts until a surface level with the deepest original depression is attained. The flatness attainable with a plane is greatly dependent on the skill of the workman. He must always try to plane "hollow" rather than round, for if a plane be sufficiently long in the stock, it is impossible for him to give any appreciable concavity to a surface of moderate size. For this reason roughing out planes, or "jack planes," are made as long in stock as possible, without making them too heavy and inconvenient, the usual size being from fourteen to eighteen inches long. Planes used for "truing," or "trying planes," as they are incorrectly called, are used to correct the inequalities left by the former, and are usually from twenty-two to twenty-four inches in length, or even twenty-eight to thirty inches, in which case they go by the name of "jointers," and are principally used for making long joints. The smoothing plane, which is employed to give the finishing strokes to a surface which has already been flattened, is generally about eight inches long.

In grinding the edge of the cutting iron care should be taken to use a true faced grindstone, and a good flat oilstone. The front iron having once been sharpened will require no further attention, as it lies against the cutting iron in such a position as to protect its edge effectually from ever getting blunted. The cutting iron should be ground to a flat cutting edge at an angle of about 25° on the stone; and then finished on the oilstone in such a manner as to form a fresh "facet," or bevel, making a more obtuse angle with the line of the iron, say about 10° more, so that the total inclination edge will be about 35°. In replacing the second iron on the first, the kind of work for which it is to be used must be borne in mind. If the second iron is brought very close to the edge of the cutting iron, the shaving is broken up more effectually, the work is neater and less liable to tear up; but the labor expended will be greater. As a rule, for roughing out, the edges may be somewhat distant, say about 1-16 in. apart; but for finishing, the top iron edge and the cutting iron edge should be almost on the same level.

The "bed" of the plane iron is made at different angles, to suit different kinds of work; the four angles most in use are known as *common pitch*, which denotes that the back of the iron reposes on its bed at an angle of 45° from the sole, and this inclination is usually employed for all surface or bench planes for soft wood. "*York pitch*" indicates an angle of 50° and is more adapted to use with mahogany and other hard stringy woods. *Middle pitch* or 55°, and half pitch or 60°, are employed with moulding planes, the former being for soft woods and the latter the harder kinds. In the course of time, the mouth of the plane gets enlarged, and out of truth. This may be to some extent avoided by keeping the sole greased by rubbing over with a piece of bacon rind; but sooner or later the mouth must be rendered smaller, which can be done by letting in a piece of box-wood in front of the cutting iron. Some planes, especially those used by cabinet makers, have the sole made either entirely or in great part of brass or iron. With a mouth so fine as it is possible to make these, and by reversing the position of the cutting iron, so as to give it a pitch of about 50°, the use of the top iron is not needed at all.*

PROPORTIONS OF LIME, SAND AND HAIR.—To make a good solid mortar use one measure of quicklime to five measures of sand for brickwork; and one measure of quicklime to four measures of sand and one-third of a measure of bullock or horse hair, for plastering mortar. Put on the first or scratch coat one-half an inch thick, the second, or brown coat, one-quarter inch thick. The third, or finishing coat, one-eighth of an inch thick, contains no hair, and is made of one measure of lime to two of saud, and the purest sand is used; this is called stucco. Hard finish requires one measure of ground plaster of paris to about two of quicklime, without sand.

TESTING LEATHER.—A simple means of testing the quality of leather consists, according to M. Bitner, in watching its behavior when treated with acids—preferably acetic acid. Leather not completely saturated with tannin will swell up; but if the tanniu has penetrated, the leather will not swell.

Good Health.

The School Girls' Meals.

The physical education of school girls is now receiving so much attention that it seems in place to ask the attention of mothers to the bad habits in eating into which a girl who attends a daily school is very apt to be driven. A girl who is growing, who studies, and who has all sorts of demands made upon her time, brain, and health, certainly needs sound sleep and plenty of nourishing food. The *sleep* she may get; for nature is likely to have some influence in this connection, but the majority of these girls get as little comfort from their *meals* as is possible. They are not apt to rise early unless it is to gain time for study or practice, and they hurry through their breakfasts, nervous for fear they will be late, and perhaps anxious about their lessons. Before the rest of the family has come to the second cup of coffee, the girls have finished their meal and probably are off to school.

They carry with them a lunch that is rarely tempting, but still more seldom nourishing, and this scanty, ill-digested breakfast, supplemented by the luncheon of bread and cake, must support them through all the morning hours of constant work. If the family has dined in the middle of the day, the girl's dinner has been saved in the oven, and is put down before her on the corner of the dining table, where it looks anything but inviting She is probably tired or excited—for the average school-girl alternates between these conditions—and she is not tempted to do more than hungrily satisfy her appetite, or wearily turn from the half-dried meal. If the dinner hour comes later in the day, she possibly studies her next day's lesson while waiting for her meal, and finds it hard to fix her mind upon her book. If dinner were ready, she fancies the lesson would not seem so complex, and as fasting rarely clears the mind of any one less saintly than a monk, she is right. After dinner, however, matters are not much mended, for then she finds herself growing sleepy, and the bed is the object of desire. That she is undergoing a slow process of starvation does not occur to the mother, who watches her with anxiety, and who prohibits parties, and long walks and late hours. The doctor orders iron to give tone and appetite, when he had better order time and tempting, nourishing food.

The boarding-school girl, in spite of the grumbling about the table, is often better off, in this respect, than the daughter at home, for eating at school is regarded as one of the duties of the day, and it is attended to with some degree of order and leisure. We commend this subject to mothers for attention, and it might be suggested to doctors who are asked to help the daughters to better health, that they sometimes should prescribe plenty of good food and plenty of time for eating and digesting it. —*Scribner.*

Dying of Stupidity.—Good temper, and the equanimity which is its result, are generally thought to be promotive of longevity. Yet if we may believe "an eminent physician," quoted by Lord Jeffrey, "the wealthier members of the Society of Friends, often die of stupidity, and rarely live to be fifty; eat too much and take too little exercise, and, above all, have no nervous excitement." This remarkable statement was made in 1813. Some persons may disagree with its conclusions as a whole. It may, however, be conceded that a reasonable amount of nervous stimulus is healthful—its absence being as injurious as an excess would be. It has been noticed that men who have worked hard for many years, are often carried off by some sudden or unlooked for disease, soon after retiring from business. Radical changes of habit, indolence and over-exertion are alike hazardous to perfect health.

What Makes Bald Heads.—A correspondent of the Chicago *Tribune* enters a protest against the practice of shampooing. He says: "It is well enough for the people of this country to understand once for all that the reason why there are so many bald-headed young men now-a-days is the universal custom that prevails of shampooing the head with stimulating washes. The wonder is that there are any men left who have full suits of hair. The custom should be discontinued at once, and young men should be warned in season against this most pernicious practice. Let shampooing cease from this time forward."

Health.—If this supreme blessing were enjoyed by all, and there was no sickness, and all lived the allotted term of human existence, (or three score and ten), what a heaven there would be on earth! But perhaps this will never be, though we observe that the mortuary record of Boston says that of the 142 people who died here during the week ending on the 17th inst., forty-six were of American parentage and ninety-six of foreign. The Americans lead greatly in regard to health. It is curious to mark how nearly equal were the deaths in the sexes—seventy-two males and seventy females.

Toothache.—Dr. Q. C. Smith praises the following most highly: Take of carbolic acid saturated solution, chloral hydrate saturated solution, paregoric, fluid extract of aconite, of each an ounce; of oil of peppermint half an ounce; saturate the pledget of cotton or a piece of sponge, and tightly pack in the cavity. —*Charleston Med. Jour.*

Effect of Exercise.

It is found by observation that the effect of "training," or the persistent use of gymnastic exercises, is to enlarge the heart and lungs both in size and capacity. It is stated by the superintendent of a public gymnasium that one of the persons sent to be instructed in gymnastics gained five inches in girth around the chest in less than three months. That this growth is not explained by mere enlargement of the pectoral muscles, is proved by the increased volume of air which the lungs are enabled to expire, as is demonstrated by the spirometer, and post-mortems abundantly show an increased capacity as well as size in the heart and the large blood-vessels. The lungs increase both in length and breadth, forcing the ribs outward and the diaphragm downwards.

It is for this reason that athletes and gymnasts are enabled to make prolonged and violent exertions without getting out of wind. The capacity of the heart and central arteries being enlarged, they can accommodate more blood. Their contractile power being increased by this new demand upon them, they are enabled to send on the current through the lungs with increased velocity, and thus by their greater capacity are able to oxygenize the blood as fast as it is supplied to them, and so no congestion takes place, and no inconvenience is felt. The normal capacity of the lungs of an adult male is about two hundred cubic inches. It is computed that an enlargement of three inches around the chest gives an increase of fifty cubic inches of lung capacity.

Danger of Protracted Sleep.—But here, as in so many other cases, the evil of deficiency has its counterpart in the evil of excess. Sleep protracted beyond the need of repair, and encroaching habitually upon the hours of waking action, impairs more or less the functions of the brain, and with them all the vital powers. This observation is as old as the days of Hippocrates and Aretæus, who severally and strongly comment upon it. The sleep of infancy, however, and that of old age, do not come under this category of excess. These are natural conditions, appertaining to the respective periods of life, and to be dealt with as such. In illness, moreover, all ordinary rule and measure of sleep must be put aside. Distinguishing it from coma, there are very few cases in which it is not an unequivocal good; and even in comatose state the brain, we believe, gains more from repose than from any artificial attempts to rouse it into action.—*Edinburgh Review.*

Useful Information.

The Watch.

"Watch" is from a Saxon word signifying "to wake." At first the watch was as large as a saucer; it had weights, and was called "the pocket clock." The earliest known use of the modern name occurs in a record of 1542, which mentions that Edward I. had "one larum or watch of iron, the case being likewise of iron-gilt, with two plumettes of lead." The first great improvement, the substitution of the spring for weight, was about 1550. The earliest springs were not coiled but only straight pieces of steel. Early watches had only one hand, and required winding twice a day. The dials were of silver or brass; the cases had no crystals, but opened at back, and were four or five inches in diameter. A plain watch cost the equivalent of $1,500 in our currency, and after one was ordered it took a year to make it.

There is a watch in a Swiss museum only three-sixteenths of an inch in diameter, inserted in the top of a pencil-case. Its hands indicate not only hours, minutes and seconds, but also days of the month. It is a relic of the old times, when watches were inserted in snuff-boxes, shirt-studs, breast-pins, bracelets and finger-rings. Many were fantastic—oval, octangular, cruciform or in the shape of pears, melons, tulips or coffins.

What is True China or Kaolin?—China clay is formed by a natural process of washing from the decomposed feldspar and aluminated quartz, of certain kinds of granite. Kaolin, or China clay, is of an earthy texture, containing about ten per cent. of free silica, and equal parts of combined silica. Its preparation for the potteries consists in subjecting the decomposed rock to washings or streams of water, the quartz, mica, and other particles falling by their weight, or being moved by the velocity of the stream, while the finer qualities settle in tanks, or dried in the clay press to a stiff clay, fit for the wheel, and afterwards cut into blocks. The albite variety of feldspar readily decomposes, and the porphyritic rocks of Cornwall afford an easily worked clay. The Staffordshire potteries alone use more than 10 000 tons of the finer kind of China clays from Cornwall and South Devonshire.

Pottery and Porcelain.—It was supposed, a few years since, that the ancients knew nothing of covering earthenware with a vitreous glaze, but recent discoveries have shown the contrary. Egyptian researches have thrown considerable light upon the subject of glass Sir G. Wilkinson, Winckelmann, Layard, and other authorities have proved that glass and earthenware were made 3,500 years ago.

How to Lay Brick.

A great many masons who claim to be good workmen fail to lay brick well. Almost invariably they mix the mortar too stiff and use entirely too much of it, making joints as large as they would in a common red brick wall; corners will be found badly matched, the labor of cutting and fitting being replaced by a liberal supply of plaster. The most skillful plans and the best quality of brick count for nothing when joints are made half an inch thick. Fire mortar should be thin enough to run almost like water; the brick should be dipped in it and rubbed together, or else laid dry and the mortar poured on afterwards, the great aim being to secure solid, even work; all important joints should be carefully made with cut or matched brick, no holes being left to be patched with bits of brick or clay.

There is another point in this connection worth looking after: Boss masons often have their own ideas about correct shape and proportions, and with a total disregard of plans they jog on with cheerful unconcern in the old beaten track. Failure, due either to faulty plans or bad workmanship, is not to be local; a more general giving out follows from bad stock. A change of ore in a blast furnace may quickly cut it out, some varieties being particularly hard on brick—that also may make the difference between a blast of six months or one of as many years. A cupola which usually lined up once a year changed its fuel and destroyed the same brick in three months; I remember another instance in which the same change in a rolling mill doubled the quantity of brick used. Sulphury stock is especially severe on ordinary fire brick, destroying them just as it does cast iron. An examination of the burned ends will indicate partially to an expert whether the stock caused the trouble, but consumers can judge better concerning this from their books.

In cases of failures from bad management it is especially hard to locate the blame, because the evidence must necessarily come almost entirely from parties having a direct personal interest in the result of their testimony; no general rules can be laid down to meet these cases; usually only a thorough investigation by an expert will throw any clear light on the subject.

Pins.—We believe that pins, as we now have them, came into use about the year 1483, and the perfection of pins was insured in 1543 by an act of Parliament which read, "that no person shall put to sale any pins but only such as be double-headed, and have the head soldered fast to the shank of the pin, well-smoothed, the shank well-shaven, the point well and roundly filed, canted and sharpened." In 1626 the pin manufacturing business of Gloucester, England, became so great that 1,500 persons were employed. The first American manufactory was established in 1812, and at that time a paper of pins could not be purchased for less than one dollar, and the first attempt at pin making was successfully made in New York City. A machine patented in 1832 by John I. Howe, was the first to produce in America pins with wire and "spun heads," and in 1840 the same gentleman began making pins with solid heads. The pins of Mr. Howe are more extensively known, and the demand for them much greater than the products of other manufacturers. Previous to the introduction of pins, their place was supplied by many awkward substitutes. Those found in Egyptian tombs are exceedingly bungling in make-up, and are in most instances seven and eight inches long. Their heads are large and made of gold, facts which would render them at the present unfit for any practical purpose. The ancient Mexicans used thorns, and the English for a long while used bits of sharpened wood.

Early Pottery Operations in England.—Lambeth, 250 years ago, was noted for its potteries. At about that time some Dutch potters established themselves there. Glazed pottery and tiles manufactured by them became celebrated, and the wares were sold throughout the kingdom. The Staffordshire potteries, which arose about a century ago, supplanted the Lambeth delft manufacturers. Still one or two good houses sustained the reputation of the district. The late Vienna Exhibition has shown to what extent chemical manufacture has developed the production of fire clay into glazed stoneware crucibles. One of the most remarkable productions of the pottery art was a stoneware pump of large size, and capable of being worked by steam power. This pump was to pump hydrochloric acid into the alkali works. The difficulty of handling this liquid made the manufacture a matter of necessity.

London, with 3,254,260 inhabitants, is the most populous city in the world, while Philadelphia, with 674,022 inhabitants (in 1870), is the eighteenth city in point of population. These eighteen cities, in their order, are the following: London, 3,254,260; Satohan, China, 2,000,000; Paris, 1,851,792; Pekin, 1,300,000; Tschautschau Fu, 1,000,000; Hangtscheu Fu, 1,000,000; Siangtan, 1,000000; Singnan Fu, 1,000,000; Canton, 1,000,000; New York, 942,292; Tientsin, 900,000; Vienna, 834,284; Berlin, 826,341; Hangkan, 800,000; Tschingtu Fu, 800,000; Calcutta, 794,645; Tokio (Yeddo), 674,447, and Philadelphia, 674,022 Of cities that are smaller than Philadelphia, the leading ones are: St. Petersburg, 667,963; Bombay, 644,405; Moscow, 611,970; Conetantinople, 600,000; Glasgow, 547,538; Liverpool, 493,405, and Rio de Janiero, 420,000.

Domestic Economy.

Recipe For Making Currant Wine.

The editor of the Germantown *Telegraph* says:—For several years we made a ten-gallon keg of currant wine, of as good quality as any we have tasted, and is generally so pronounced by those who have had an opportunity to judge. The mode of manufacture is simple, and can easily be followed by any family having the currants, and the disposition to make the wine.

The currants should be fully ripe when picked; put them into a large tub, in which they should remain a day or two, then crush with the hands, unless you have a small patent wine press, in which they should not be pressed too much, or the stems will be bruised and impart a disagreeable taste to the juice. If the hands are used, put the crushed fruit, after the juice has been poured off, in a cloth or sack and press out the remaining juice. Put the juice back into the tub after cleansing it, where it should remain about three days, until the first stage of fermentation is over, and removing once or twice a day the scum copiously arising to the top. Then put the juice in a vessel—a demijohn, keg or barrel—any size to suit the quantity made, and to each quart of juice add three pounds of the best yellow sugar and soft water sufficient to make a gallon. Thus, ten quarts of juice and thirty pounds of sugar will give you ten gallons of wine and so on in that proportion. Those who do not like sweet wine can reduce the quantity of sugar to two and a half; or who wish it very sweet, raise it to three and a half pounds per gallon.

The vessel must be full and the bung or stopper left off until fermentation ceases, which will be in twelve or fifteen days. Meanwhile the cask must be filled up daily with currant juice left over, as fermentation throws out impure matter. When fermentation ceases rack the wine off carefully, either from the spigot or by a syphon, and keep it running all the time. Cleanse the cask thoroughly with boiling water, then return the wine, bung up tightly, and let stand for four or five months, when it will be fit to drink and can be bottled if desired.

All the vessels, casks, etc., should be perfectly sweet, and the whole operation should be done with an eye to cleanliness. In such event every drop of brandy or other spiritous liquor added will detract from the flavor of the wine, and will not in the least degree increase its keeping qualities. Currant wine made in this way will keep for an age. We have some made in 1856 which is really an excellent article.

Good Pie Caust.—Many persons have difficulty in making pie crust, often finding it heavy and dark. A lady writer in the Vermont *Journal* gives directions how to avoid this: To one quart of flour thoroughly mix one small teaspoonful cream tartar, one teacup of lard, (less will do,) lightly rubbed in the flour, one teaspoon salt, half teaspoon soda dissolved in very cold water. Mix lightly with a knife, pouring in a little of the water at a time. Do not wet all the flour, and do not knead it. If you want the top crust to resemble puff pie crust, roll out some of your dough and spread on lard, sprinkle on flour, then roll up. Now, do not as I do, to, cut off a piece and turn the edges up before roll out. I have learned a better way the with your rolling pin a piece large enough rates your top crust, just as it lies rolled up round, board. Wet the bottom crust around feed edge with cold water before putting the top crust. Do not pinch the edges of the rod crust down. Cut or prick, to let the cotted while cooking. Bake in a quick oven the will have a nice looking pie. feed the

Jenny Linn's Soup.—Mr. Editor:—Your respondent, R. Hooker, in a late communication, asks for the recipe of Jenny Lind's soup which was constantly prepared for her by her own cook. It is not an expensive article, being composed of sago, eggs and cream, upon a basis of beef or veal stock. I give the recipe in full: Wash a quarter of a pound of the best pearl sago until the water poured from it is clear; then stew it quite tender in water or thick broth; it will require nearly or quite a quart of liquid, which should be poured on it cold and heated very slowly; then mix gradually with it a pint of good boiling cream and the yolks of four fresh eggs, and mingle the whole carefully with strong veal or beef stock, which should be always kept ready boiling. Mlle. Lind was in the habit of taking the soup before she sang, as she found the eggs and sago soothing to the chest and beneficial to the voice.—*Germantown Telegraph.*

Cheese Fritters.—Slice thin one-half dozen large tart apples, and prepare half as many thin slices of nice cheese. Beat up one or two eggs, according to the quantity required, and season high with salt, mustard and a little pepper. Lay the slices of cheese to soak a few moments in the mixture, then put each slice between two slices of apples, sandwich style, and dip the whole into the beaten egg, then fry in hot butter like oysters, and serve very hot. These fritters are an addition to any breakfast table.

Graham Muffins.—Take one pint sweet milk, one teaspoonful salt, two tablespoonful brown sugar, one teaspoonful baking powder, one teaspoonful butter, not melted; mix and make as for gems.

STATE INDUSTRIAL EXHIBITION OF CHIthie exhibition, which will be held ember 8th to October 9th, 1875, the ....do.... Academy of Sciencea will assume the son of the depsrtment of natural history, addition to placing an importaut part own collection on exhibition, its manare will attend to the propar classification, arrangement snd display of all other contributions to that department, and at the close will make such disposition of the latter as contributors may direct. If placed in the muaeum of the Acsdemy neceaaary expensea of tranaportation, etc., will be paid. This departure of the Academy of Sciencea from the usual policy of scientific bodies ae regards temporary public exhibitions, is made partly with a view to excite a more genaral intereat in the study of natural history, but chiefly, at present, to afford to all proprietore of minea—gold, silver, copper, lead and iron, and other minerala—a reliable medium andjfavorable opportunity for bringing their products directly to general public notice. It is intended to make the collection fairly repreeentative of the commercial wealth of the Western Statea and Territories.

THE KOHLER REDUCTION AND REFINING WORKS, Damon's landing, Alameda county, will commence operatione next week. A prospectus of the company will be found in our advertiaing columns. As soon ae the works are started up we will give a detailed description of them, with such facte concerniug the process ae the inventors care to make public.

THE track of the Southern Pacific railroad is now extended a few milea beyond the Santa Ana river, and will be pushed energetically across the San Gorgonio pass. Material for finishing the road ae far as Dos Palmoe is rapidly arriving, and there will be no interruption in the conatruction until that point is reached.

Gold vs. Silver Mining.

In our last iasue we called the attention of onr gold miners to the fact that more care should he given to the saving of a larger percentage of the gold contained in the orea, if they expect gold mining to command capital as readily as silver. For fifteeu yaars silver mining has hsd the lead, commanding millions of capital, and the reason for it is thst while the educated and practically skillful amalgsmators who are generally employed, procure from saventy-five to eighty-five per cent. on the average, the California gold mills fall below it—a wsste which gold miners must remedy.

When it comas to the value per ton between the gold ores of California and the silver ores of Navada, we verily believe tha wealth in gold axceeds that of silver, the main fault being in the reckleasness with which our gold ores hsve been handled. With many it is considered neceaaary only to rig up a set of stamps and lat them pound awsy, with chesp, inaxperienced hands to attend to the amalgamating depsrtmeut. The end in too msny inatances is failure, to the datriment of whole mining diatricts, and generally winding up hy saying, "the ora is rich but we can't save tha gold." Now what suggests itaalf to evary sensible miner for making gold mining attractive to capital and successful for themselvaa and for giving life and vigor to all our gold quartz sections? It ia very clear more care must be given to the manipulation of the ores. Skilled hands ahould be employed, and if one plan doas not succeed in securing a proper percentage of assay vslue—which in no case should fall helow savanty-five per cent.—another ahould at onca be sought out. All silver ores cannot be handled successfully the same way. The Comstock ores are treated by a very simple method, thay being the easiast of all ailvar ores to handle; but the sama syatem would be a complate failure in Panamint district.

There is one thing which our gold quartz minsra must consider, and that is, coarse gold is the exception and "flour gold" the rule in gold ores, while they are worked for the excaptional particles and not for the atoms. An old adage might apply here, "take care of the cents and the dollars will take care of themselvea." We say tske csre of the fine gold and the coarsa is aure to look out for itself. Our mountain gold minera and city gold mining operators ehould remember also that there ia a eettled inactivity in our gold mining stocks. In the three different stock boards now in operation in San Francisco, the eilver mining atocks alone are those which to any marked degree commsnd attention, many of which sre merely holes in the ground, while the gold stocks, which have a real value, go begging. Msny a gold property suffers for the want of a few dollare, while millions sre squandered in worthless eilver mines, because silver ie the favorite. If our operatore should form a gold mining stock board, which should deal only in gold mines, it might help matters a little and assist in building up the gold mining intereste of California; for with all our wsstefulness, they will show as good records for interest on capital *invested*, ae does silver mining. Of course we must except a few mines on the Comstock, which are the world's wonders. By a combination of capital in gold as in silver mining, our gold intareets would not languish as they do; and with a gold etock hoard handling such stocks exclusively, attention would be called to such mines.

The Comstock, to-day, would have been a barren wsste but for the advantages of a method of making saleable ratee, by which meana aeseesments were levied and developments csrried to a successful discovery of wealth. Our gold mining interesta have never had these advantages, but if they were properly bronght before the public in the aame mauner ae this silver stock, much benefit would accrue, and more capital be forthcoming.

What depth brings forth in our gold mines is shown by Hayward's mine in Amador, the Washington in Mariposa, and the Idaho and Eureka in Grase valley; but then few companies can put in the capital for such developments. It should be done by the many who are ever willing to venture a few hundreds with fair chances of a good return. We are led to these observationa from a desire to advance the gold miuing interests of California, and hope all those interested who have sny suggestions to the aame end will favor us with them for publication. In the East there ie a growing intereat in our mines, which, if nuraed, will bring a good deal of cspital to our shorea, and gold mining for this Eastern unprejudicad capital is more attractive than silver. If a gold hoard was formed it ehould be maintained by our leading operators, and might aerve to attract capital to home minea, and away from the Comstock, which has already as much as it wants.

The plan would, without doubt, be well received by our mountain minera, if the proper parsons took the initiative step. Something muat be done, at any rate, to eave our gold mining interesta, and we ahould be glad to hear of any feaaible plana to attract capital in that direction.

The heat on the 1700-ft level of the Gould and Curry mine is still intense, and but slow progress can be made with the retimbering of the drifts.

Water for the Hydraulic Mines.

The water supply for most of the hydraulic claims in California is pretty short, and rapidly diminishing under the influence of July weather in the mountains. A number of hydraulics are in operation still, however, although most of them will shut down soon and wait for the expected delnge in the fall. The minera are all praying for esrly and heavy rsins, and we sincarely wish thair most sanguine expectationa will be realized.

Msny naw mines are being opened in different parts of the Stste as naw ditches ara started or old ones extended. In some places conaiderahle local interest is excited in opening up new diggings and re-opening old ones. In Butta county, according to the *Mercury*, hardly a day passas that does not sae aoma new mine added to the liat of thoaa that pay well for the labor hestowed on them. Whila considerahle attention hss been paid to the mines in Forbeatown, thare has also been in anothar psrt of the county a larga amount of work done and money expended. The Red Hill hydraulic mining and watar company, on the West Branch, intend to dam Wast Branch and turn out every drop of water into a ditch that shall run nearly parallal with it. Now thara are 9,000 inches of water, but it will gradually fall to 5,000 which will ba sll sufficient for mining or any other uses that tha company will have for water. Thay intend to mina the hed of the river as far aa they own, or rather in auch places aa they think will pay best, for they have ground all the way along for fifteen or twenty miles.

The huga ditch is already under wsy and is marching along as fast as niuety-five men under the charge of an energetic superintendent, Mr. G. F. Whitman, can push the work. Knowing that a large amount of timber would ha needed both now aud in the future, tha oompany have completed a fine aaw mill at tha hesd of the ditch, where everything can be eaaily got at. Probably there is no richar district in California than tha one about to ba opaned up. That an abundanoe of gold wss in tha bed of the stream snd on the bars, has long been known; but owing to tha volume of water it wss impossible to get st it. But now tha question will soon be tested. Mr. Whitmsn will be all ready by the middle of Auguat to hagin washing.

The Forbestown ditch, the property of the Feather River and Uniou mining company, and intended to work their claims at Sicard Flat, will not, it is said, work the injury to the ranchmen that was at first expected. The President of the company states that they never intended to divert the water to the extent of injuring a single ranch along the line of their ditch. They had taken psina to inquire as to the number of days in the week that the ranchers needed wster this eeason, and had heen told that oue day would be anfficient; and they therefore gave their agent instructions to run the water down during Sunday for irrigating purposes. Mr. Green, in an interview with the editor of the Oroville *Mercury*, was very emphatic in his declaration that the ranchers should have watar. If there was not enough for the claim and ranchee, the latter should receive the preference; for, said he, our claims will laat only five or six yeare at most, and then if the ranches were destroyed we ehould have no sale for our water.

The Gold Run tunuel, in Placer county, calculated to tap the deep gravel deposits of that district, has juet been completed. Thia tunnel, including branches, is over half a mile in extent. The Gold Run ditch and mining compsny, which hae been prosecuting this work, have contracted to run 1700 feet of tunnel in the Dutch Flat district, preparatory to beginning which they are now moving their worka. In running these extensive tunnels the Burleigh drill is used almoet exclusively.

The miners everywhere are anxiously waiting for a water eupply and preparing their claims for the wet season with all the energy possible.

MINING ITEMS—Calistoga *Press*, July 20: The new furnace at the Great Western miue haa been completed and was fired up last week. In 7 daya from the firing up 24 flaake of quicksilver were taken out, from 2 condensers. It generally takes from 2 to 3 weeks to "amoke" the condenaere, but as thie new furnace is perfect, and the ore rich, they have "smoked" the condeneere with the above result. This ie the best showing for the richnese of a mine on record, and there ie no telling what amount of metal will be taken out when the furnace is in full blast. Thie week 105 flasks were shipped from the mine—the work of 7 daye. Next week 3 furnaces will be in full rnnning order.

THOS. N. WAND, has been elected snperintendent of the Excelsior mine, *vice* C. D. Morriaon, rasigned.

SENATOR JONES of Nevada, A. T. Stewart of New York City, J. D. Coughlan and Georga Brown of California, have bought a piece of land at Delord and Annunoiation atreets, New Orleans, whereon they intend to build an artificial ice factory 150 feet long, 116 feet wide and more than 50 feet high, to cost $125,000. They have an ice factory in California, one in Chattanooga, one nearly finished in Galveston, and are about to build one at Atlanta.

Among the Foundries and Machine Shops.

Work continues unabated at our various foundries, and the machinists of San Francisco may congratulate themselves that their lot has been cast in a city where mechsmical labor maata with such constant damand and so liberal a return ss it doas here.

The Occidental Foundry.

The force at this foundry, hesides turning out the ususl amount of small work, is being directed to filling the contract for the construction of the appliances to be used by the Fryar Brothers in their process for reducing oraa, which is to be first put to practicsl tast st Grass Vallay, Nevads county. The proprietors of the Occidantal are constructing six-taen tanks, thirty inches square and aix and one-hslf feet long. Sixteen such tanka have sufficient capacity for a five-ton mill. Of course the Fryar process is a profound aeorat, and will remain so until the patents are thoroughly parfactad. If it provas tha success which ita inventor claims, it will certainly have an importsnt effect on the mining interests of the Pacific coast. As is well known, Mr. Fryer, the inventor, ssserts his ability to obtain 95 per ceut. of the assay of all ore treated by his process.

Fulton Foundry.

Messrs. Hinckley & Co., of the Fulton foundry, have just completed and have nearly ready for shipment two condensing propeller angines, 20x24 inch, built to the order of the Humboldt ateamship company. Thay will be used in a steamar built at Humboldt bay, and soon to be launchad, which ia intanded for paasenger and freight, and will ruu between this city and Humboldt. She is 157 feet on deck, tan feet depth of hold and proportionate tonnage. Part of the force of the Fulton foundry are now employed in getting out the iron work to he used in tha extension of the Nuclaus building, and the improvemants going on at the cornar of Market and Second straeta, both buildinga the proparty of the Cunningham estata. Tha work whan completad will aggregata 600 tons in weight.

Etna Foundry.

At the Etna foundry, Mr. G. W. White hsa baen overseeing the construction of a "Whita furnaca," for the Jeffarson miniug company, of Nye county, Nevada. It will have a capacity of from twenty-four to forty tona per day, and when placed will cost $10,000. This furnace is the largest of ita description ever built. The cylinder ie forty inchea in diameter snd twenty-four feet long. The brick work is enclosed with iron plates. Among the new features introdnced in this furnsce we noted perforated door waye or blowers attached to the firing doora, ao that no emoke eecapes when opened. Also a double friction wheel for turning the cylinders. The shipping weight will be twenty tons, and Mr. White expects to hsve it in running order within six weeks.

At this foundry Mr. A. J. Doolittle is engaged in making some important improvemente in hie celebrated hand boring augur. He ia getting one ready aoon to be used at Michigan Bluff, a point where it has been lsrgely need and is best known. Mr. Doolittle feels confident that when thoroughly perfected he will havo one of the most valusble labor eaving msohines of the day. In cutting tunnels and working in gravel and cinnabar banke, it hae demonetrated remarkable utility.

Meesrs. Pendergsst & Smith, the proprietors of the Aetna, have a lsrge number of important ordcre on hsnd, and are conatantly turning out miacellaneous work.

Progress at the Sutro Tunnel.

The following ia the report of progress in the Sutro tunnel, for week ending July 22, 1875:

Number of feet in tunnel, July 15	10,049
Number of feet driven during week	85
Distance in, July 22	10,134

Detaila of work performed are ae follows, heading being 8x10 feet:

Holes drilled	333
Holes blasted	330
Aggregate depth	2262 feet
Average depth	6.79 feet
Powder consnmed	1,006 lbs
Exploders consumed	352
Rock extracted	1,000 tons

ROCK — Comstock porphyry containing pyrites and seama of calcspar and quartz; excellent drilling and blasting. Will have to be partly timbered after pasaing through.

WATER. — Quantity flowiug, forty minere inches.

AIR.—Temperature at heading, 80°; ehaft No. 1, east, 64°; west, 67°; ahaft No. 2, east, 78°; west, 82°; mouth, 86°.

[Signed] A. SUTRO, Gen. Supt.

THE Belcher ore extraction atill continues to pay a profit for working, and it is thought the prospects of the Belcher mine, for finding new bodies of ore on the lower levels, are certainly as good to-day as that of any mine on the Comstock lode.

The Spring Valley mining company, of Cherokee Flat, Butte county, last week shipped three gold bars worth $63,000.

The Mountain Meadows Massacre.

The trial of Lee, nt Beaver City, Utah, for rticipation in the Mountain meadows mass- re in 1857, gives a new interest to that mem- rable tragedy; and it is only now that the ruth has come nut with all its harrnwing de- aila. Previous to the year mentioned the Mormons had always been glad to trade witb 'American" emigrants, and the passage of u rain was an event of interest, so that Salt Lake became a second outfitting place for emigrants California. These omigrants found things hanged on their arrival at Salt Lake, as no ne would trade with them. They left and topped a week at Provo, fifty miles south of alt Lake, bnt were finally ordered to move on the mayor of the town. The emigrants oved on slowly, as the strength of their ani- als was giving way. They heard of Moun- tain meadows as a good grazing place, and here they concluded to wait until ready to un- dertake the desert journey.

During the first day of their stay at the meadows they looked over their provisions and found that they had barely forty days' rations for a sixty days' journey, bnt they saw no alter- native and they resolved to attempt the jour- ney. The last Sabbath was spent in religious exercises, and next day at dawn they prepared to start. Just as the sun rose upon their tents and wagons a volley of musketry was heard and seven men standing by a camp fire were killed. The emigrants prepared to defend themselves as best they could. They were cut off from the spring, and all who attempted to reach it were shot. From the beginning of the siege the emigrants found that Mormons were with the Indians, but they saw no signs of white men. On the fifth day of the siege, the 15th of Sep- tember, 1857, the emigrants saw a wagon with horses approaching, and white men bolding aloft a flag. It was of course supposed that help was coming.

In those times, when the Mormons were preparing for war with the United States, every county in Utah had its own military organiza- tion, and Iron County, within whose limits were the Mountain meadows, had a body of militia called the First Iron County regiment. Soon after the emigrants passed through Cedar City, a portion of this Iron county regiment received orders to make ready for service, "armed and equipped as the law directs," and with the necessary transportation, camp equip- age and ammunition for a short campaign. These Mormon soldiers marched south in the direction of Mountain meadows. Some days later a messenger arrived in Cedar City from the south, and Lieutenant-Colonel Haight im- mediately dispatched more troops to reinforce those who had gone before.

On the morning of the fifth day's siege these two bodies of troops formed a junction on the meadows north of the emigrant camp, and near them were a number of Indians arrayed in all the glory of war paint and feathers, and armed with rifles, bows and arrows, knives and toma- hawks.

The whites were called to order and a docu- ment was read to them and submitted for their acceptance or rejection. Did they approve of it? Would they carry it into execution? The answer was unanimously in the affirmative. It was from this body of Mormon militia and their allies, the Indians, that the party in the wagon had proceeded toward the emigrant camp, and the chief man of that deputation was John D. Lee.

The emigrants related to him what they had suffered. He listened with attention and pro- fessed the greatest interest. Some of the cat- tle had been driven away and some killed, but Lee would hunt up the hostile Indians and see what arrangements could be made with them for the deliverance of the emigrants.

Lee returned as peace commissioner in a few hours and told the emigrants to lay down their arms so as to show the Indians that there was no deceit in their suing for peace; he would give them safe escort to the settlements. They could do nothing else, so the sick, wounded, and aged, the women and children, were put in the wagons and they were hurried out of the corral. Then came the men, unarmed, in single file, under the protection of the militia. After going about half a mile the order to halt was given at the head of the column.

No sooner had the emigrants and their Mor- mon protectors answered to the order "halt," than the officer in command, without a mo- ment's hesitation, ordered "fire," and in an in- stant more the bodies of the confiding emi- grants were struggling in death. The Indians were lying in ambush, and at the signal for the massacre they sprung from their concealment and fell upon the aged and infirm, women and children, sparing none who were old enough to remember and ever tell the tale of the bloody deed.

The screams of the frantic women and the yells of the savage Indians filled the air. Again and again the shrieks of the mothers were heard pleading for their children, but there was no mercy on Mountain meadows. Over one hundred and twenty men, women and children had been deceived and betrayed into ambush, and in half an hour they lay cold in death. The engraving shown on this page is a representation of this scene, which was pub- lished shortly after and will give a faint idea of the massacre. Scenes in that dark tragedy have been related by some of the white fiends who took part in it, that make the blood curdle in one's veins. Some of them tell how the brethren seized the children by the hair of the head and looked them in the face to judge whether they could remember the terrible scenes or not. If the child was too intelligent to live the butcher cut its throat, and still worse, some of them were taken by the heels and their brains dashed out against the wagon wheels.

When the slightly wounded in the first fire essayed to escape, they were pursued and hunted by white men and Indians as if they had been the wild beasts of the forest. Seven- teen children who were considered too young to remember the crime were saved and dis- tributed among the Mormons. All the details of the terrible tragedy are now coming out at the trial of the Mormon Lee, and the blame is now thrown to a certainty upon those who were long suspected. The whole affair, coming out

MASSACRE OF EMIGRANTS AT MOUNTAIN MEADOWS.

as it does at present, will be a fearful blow at Mormonism and do much toward rooting it out of Utah.

A New Quartz Crusher.

We examined this week, at the corner of Main and Folsom streets, in this city, a novel quartz crushing machine, which is constructed on a principle entirely different from anything now in use. It is the invention of Mr. Stephen Kendall, who formerly resided in the vicinity of Jackson, Amador county, and who is an old mining man.

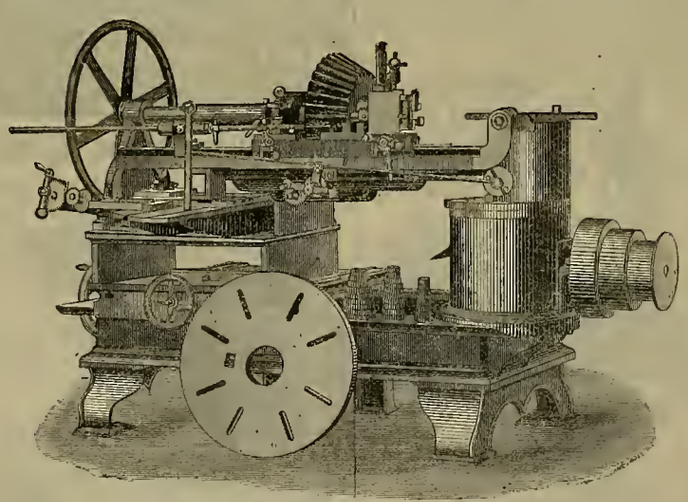
The machine is a quartz battery, which is double acting, in somewhat the following man- ner: Two ordinary mortars are placed on a frame a short distance apart. Between these two mortars is suspended, by a journal, a swinging frame, which extends above and below the base. The portion which extends above consists of a semi-circular bar or stamp stem, which is supported by arms from a shaft underneath, in such a manner, that when it is oscillated upon the journal or shaft, its ends will alternately enter the mortars. Each end of this semi-circular bar carries an ordinary stamp shoe, which will strike the dies in the mortars.

The portion which swings below the base consists of an oval frame, and inside of the oval frame is arranged a cam on a shaft, so that when the cam shaft rotates, the cam will strike the opposite sides of the oval frame alternately, and thus throws it back and forth, producing a swinging motion to the suspended frame, which causes the stamps to alternately strike in the mortars.

In the present instance there are four of these stamp stems, and as there are shoes at each end of each stamp stem, it makes an eight stamp battery. It takes very little power to operate this contrivance, and there is no expen- sive frame and complicated machinery about it. It is quite compact, and its weight and cost, as compared with an old style mill doing the same work, is much less.

This one could all be put on a wagon, stamps, bed, frame and all, and it could be set up in twenty-four hours with ease. Mr. Kendall's main idea in getting this up was to provide a practical cheap mill which will answer the pur- poses of working miners with no capital. There are many mines in the mountains which are now idle for want of reduction works, which would be worked if cheap crushing appliances were available.

Mr. Kendall thinks that this little mill will arrastras at small mines, as they will have more than double the capacity and will require no more power to run them. Something of this character has long been needed by working miners for their own claims, and those inter- ested will look to further practical experiments with the hope that the machine will "fill the bill." The mill can be seen in operation daily between twelve and one o'clock at the locality mentioned.



GEAR-CUTTING MACHINE.

GEAR CUTTING MACHINE.—The engraving shown on this page represents an improved gear cutting machine, which is made at the Kead Iron Works, 106 Mill street, Rochester, New York. The maker claims for this machine accuracy, durability and strength, producing gears of all kinds and sizes. A detailed de- scription is not necessary, as the cut is easily understood.

ON the Santa Cruz and Felton road, about 150 men are employed—principally track lay- ers and carpenters. The tunnel above the powder mill will be completed within a fort- night, after which a hand car will be able to pass over the entire line.

Notices of Recent Patents.

Among the patents recently obtained through Dewey & Co.'s SCIENTIFIC PRESS American and Foreign Patent Agency, the following are worthy of mention:

VENEER CUTTING MACHINE.—George W. Swan, San Francisco. This is an improvement on veneer cutting machines, which consists first in an improvement in mounting and operating the knife or veneer cutter and sec- ondly in a device for feeding the block to the cutting knife. The two guide timbers that sup- port and guide the cutting knife are secured at an angle and parallel with each other, the an- gle preferred being about sixty degrees. The cutting knife is secured horizontally between the inclined guides, and is guided at each end in ways on the inside of the guide timbers so that it will have an angular up-and-down mo- tion, while its cutting edge always maintains a horizontal position, thus giving a shearing cut across the entire length of the block. Cutting knives of veneer cutting machines have been heretofore mounted at an angle between two upright guides so as to give a shearing cut, but the effect is different from the above described plan because the angular knife begins cutting at the corner of the block and cuts diagonally through it, while by Mr. Swan's arrangement it cuts squarely across the block from top to bottom. By this arrangement the power re- quired to force the knife through the block is more uniform, as it cuts the same length throughout its stroke. To the lower part of the frame and in front of the knife are secured two or more horizontal pairs of guides, and between each pair of guides is a slide or dog, which can be worked by a screw backward or forward. These guides are directly in line with the bottom of the gate or frame in which the knife moves and at right angles to the knife, and the slides or dogs feed the block of wood to the knife after each stroke. The feeding screws are operated automatically by securing a pinion on the outer end of each screw, then securing a shaft transversely across the outer ends of the screws, upon which are toothed wheels which engage in the pinions referred to. A shaft is supported in boxes across the end of the support or frame at right angles to the shaft which is secured across the outer ends of the screws, and parallel with the screws. This shaft has a toothed wheel on its outer end which engages with a pinion on the shaft which is secured across the outer ends of the screws. A ratchet wheel is secured to the middle of the shaft. The knife or cutter is operated in the slides by a pitman connection with a large crank wheel on the drive shaft above. On the wrist pin of this crank wheel is secured a loosely revolving sleeve, which has secured to it a short tube at right angles to the sleeve. A rod is supported in a box on the underside of the upper timber of the frame and has its inner end bent at right angles so as to pass through the short tube. To the opposite end of this rod a slotted crank is secured. This crank is connected with a pawl carrier which has one end attached to the shaft by a connect- ing rod, so that when the large crank wheel rotates the bent rod is given a semi-rotation back and forth, causing the crank to operate the pawl holder. The pawl engages with the ratchet wheel each time the crank wheel rotates and moves the wheel a certain distance around, thus rotating the shaft and screws so as to feed the block forward after each descent of the knife. The upper end of the connecting rod is adjustable back and forth in the slotted crank, so as to regulate the movement of the ratchet feed and lengthen or shorten the feed of the block for the purpose of obtaining the desired thickness of veneer.

VINEYARD PLOW.—Milton Ross, San Jose, Santa Clara county, Cal. This is an improve- ment on that class of vineyard plows in which the rear end of the plow beam is adjustable be- tween the two handles of the plow, so as to throw the forward end of the beam either to or from the land, for the purpose of clearing the double-trees from the vines, etc., near which it is necessary to plow. The improvement con- sists in mounting the middle of the beam upon a crank pin or pivot, by means of which not only the rear end of the beam but its entire length can be shifted to or from the land side, as desired, and thus permit the beam to be ad- justed in any direction, so as to form either an ordinary plow or a vineyard plow.

OPERATING ELEVATOR AND OTHER VALVES.—Philip Hinkle, San Francisco. This is a novel device, which may be employed to operate elevators and other valves when it is necessary to open one and close another valve at the same time. It consists of a slotted segment, formed on different centers, and the stems of the valve are moved by this slot. The outer edge of the segment is provided with teeth, and a pinion mounted upon the axle of an operating rope pulley serves to throw this segment in either di- rection, as the case may require. By this con- struction the inventor is enabled to open the valves with a direct motion, and control the supply of water with accuracy.

SENATOR JONES, of Nevada, has purchased eighty new freight cars for his railroad. They will be shipped on the next steamer for Aspin- wall.

Tenth Industrial Exhibition of the Mechanics' Institute, S. F., 1875.

PRELIMINARY ANNOUNCEMENT.

The Board of Managers of the Tenth Industrial Exhibition have the pleasure of anuouncing that an Industrial Exhibition will he held, under the auspices of the Mechanics' Institute, in the city of San Francisco, to be opened on Tuesday, the 17th of August, 1875, at 11 A. M., and to continue open at least one month thereafter.

In making this pnblic announcement, the Managers desire that those who intend to exhibit should send in their applications for space as early as possible, so as to avoid the necessity of excluding, as has heen the case heretofore, the many desirable exhibitors who are unusually tardy in making applications.

The forthcoming Industrial Exhibition will he the tenth held under the auspices of the Mechanics' Institute, and the Managers are justified in saying that it will undoubtedly surpass in completeness of detail and general arrangement any heretofore held.

The last Exhibition was attended by 700,000 visitors, attracted hither by the fame of these Industrial Fairs, and for the purpose of investigation, business and pleasure.

All the available exhibiting space was applied for several weeks before the day of opening, and the Managers were compelled to deny admission to many desirable exhibits.

The Board of Managers desire particularly that the arts, the industries and natural prodncts of the country should be well represeuted at the forthcoming exhibition, and no pains will be spared to make these classes of exhibits a special feature there.

The Exhibition will be held in the building constructed for that purpose in 1874, but it will he materially enlarged and improved in many details for the Exhibition of 1875.

The space under roof will exceed 180,000 square feet, or about four and a half acres, exclusive of the Horticultural Garden, which will occupy 24,500 square feet additional.

The location of the Exhibition Building, on Eighth street, between Market and Mission streets, cannot be snrpassed for convenience and accessibility, and can be approached from every part of the city by means of the various lines of street railroads, any of which bring visitors within two blocks of the entrance gate.

The utmost care has been exercised in providing for ample ventilation and light, and during the evening the building is brilliantly illuminated by over 5,000 gas ights.

The promenade avenues are broad, and 3,000 seats are provided for the comfort of visitors, for whose convenience there is also an excellent restaurant, under the management of a first-class restaurateur.

Every afternoon and evening the best orchestra the city can supply will discourse excellent music under the direction of an accomplished leader.

The building is always well attended by visitors, and dnring the last Exhibition over 29,000 were daily admitted for a number of days, and under no similar circumstances can the manufacturer, the mechanic, the inventor, producer or business man so advantageously place himself before the people of the Pacific Coast.

Persons desiring to obtain information, or to make application for space, should address "Managers of Tenth Industrial Exhibition, San Francisco, California," or make personal application as below.

It is expected that the various transportation companies will convey goods intended in good faith for exhibition, at half the usual rates.

Exhibitors from abroad, if they have no agent or consignee in San Francisco, can consign goods and mark the same to the "Manager of the Tenth Industrial Exhibition, 17 Post street, San Francisco," and they will be stored, if they arrive before the day of opening, free of expense; but no charges or expenses for freight or forwarding, etc., will be paid by the Managers.

In order to secure space, application should be made on or before July 20th, 1875.

Blanks will he furnished on application.

Premiums will be awarded as follows, viz: 16 gold medals, 50 silver medals, Society Diplomas, Certificates Merit and Special Premiums, as the Board may determine.

Blanks for space can he obtained at the Mechanics' Institute on application by letter or otherwise; and any information will be given, by applying to any member of the Board of Managers, as below:

A. S. HALLIDIE.....113 Pine street.
JAMES C. PATRICK.....122 Battery street.
HENRY L. DAVIS.....421 California street.
D. E. HAYES.....213 Fremont street.
ASA R. WELLS.....Mechanics' Mill.
P. B. CORNWALL.....Cor. Spear & Harrison streets.
CHAS. ELLIOT.....516 California street.
GEORGE SPAULDING.....414 Clay street
RICHARD SAVAGE.....139 Fremont street.
W. F. STOUT.....604 Merchant street.
J. H MACDONALD.....217 Spear street.
J. P. CURTIS.....320 Jackson street
R. B. WOODWARD.....Woodward's Gardens.
JAMES SPIERS.....311 Howard street.

To the Librarian of the Mechanics' Institute, or to J. H. CULVER, Secretary, 27 Post street, S. F.

Rules and Regulations of the Tenth Industrial Exhibition, Mechanics' Institute, S. F., 1875.

1. The Pavilion will he open for the reception of goods on Monday, August 2d. The exhibition will be open to the public on Tuesday, August 17th, at 11 o'clock A. M.

2. Applications for space must be made on or before July 20th, stating character of exhibit, amount and kind of space required—wall, table or floor. And, if cases, state length, width and hight of case. Blanks will be furnished for this purpose, and a clerk will be in attendance at the Library of the Mechanics' Institute, every day from 12 to 1, and 7 to 10 P. M.

3. All persons presenting articles for exhibition must have them registered by the Receiving Clerk, who will give a receipt for the same, which receipt must be presented when the articles are withdrawn, at the close of the Exhibition.

4. Judges will be appointed by the Board of Managers, immediately upon the opening of the Exhibition, to examine all articles presented, in accordance with Article III, and the Managers will award premiums on such articles as the judges shall declare are worthy which will he delivered as soon as they can be prepared. Due notice will be given of the announcement of premiums.

5. The mornings of each day, until 10 o'clock, will be appropriated to the Judges, and no visitors will be admitted during the time thus appropriated, except at the special request of the Judges, or by permission of the Managers.

6. Articles intended for sale may be labeled accordingly, but cannot be removed until the close of the Exhibition, except by written permission of the Managers.

7. Steam power will be provided, so that machinery of all kinds may be seen in actual operation, and every facility possible will he given to exhibit working machinery to the best advantage.

8. The name of every article must be attached by the exhibitor to it.

9. Articles intended for exhibition must be entered and placed on exhibition on or before Saturday, August 21st.

10. Perishable articles will be received, or may be removed at any time during the exhibition, with the consent of the Managers.

11. The most effectual means will he taken, through the agency of the Police and otherwise, to guard and protect the property on exhibition; and it will he the purpose of the managers that all articles shall he returned to the owners without loss or injury. Still, all articles deposited will he at the RISK OF THE OWNERS.

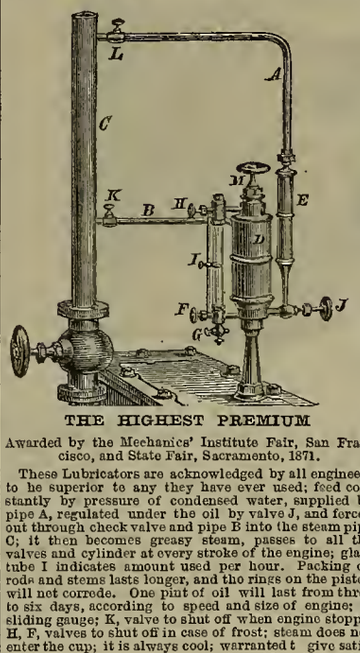
12. In case of any misunderstanding, application may he made to the Managers, who will at all times he in attendance.

13. The Managers are desirous that articles should be presented early. Those from abroad, intended for exhibition, should be properly packed, and if not consigned to exhibitor's agent, must he marked, "MANAGERS OF TENTH INDUSTRIAL EXHIBITION, SAN FRANCISCO, CAL." All articles thus received, arriving too early, will be stored free of cost to the exhibitor, and the Managers will have them duly placed in proper position for exhibition. No freight charges will he paid by the Managers; but exhibitors are notified that arrangements are being made with various transportation companies to repay freight charges on evidence of goods exhibited.

Information will be furnished by addressing MANAGERS OF TENTH INDUSTRIAL EXHIBITION, SAN FRANCISCO, CAL.

Machinery.

N. Seibert's Eureka Lubricators.



THE HIGHEST PREMIUM

Awarded by the Mechanics' Institute Fair, San Francisco, and State Fair, Sacramento, 1871.

These Lubricators are acknowledged by all engineers to he superior to any they have ever used; feed constantly by pressure of condensed water, supplied by pipe A, regulated under the oil by valve J, and forced out through check valve and pipe B into the steam pipe C; it then becomes greasy steam, passes to all the valves and cylinder at every stroke of the engine; glass tube I indicates amount used per hour. Packing on rods and stems lasts longer, and the rings on the piston will not corrode. One pint of oil will last from three to six days, according to speed and size of engine; I, sliding gauge; K, valve to shut off when engine stopps; H, F, valves to shut off in case of frost; steam does not enter the cup; it is always cool; warranted to give satisfaction. Patented February 14, 1871. Manufactured by California Brass Works, 125 First street, S F. 24v23

Yellow fever ie raging at Pensecola, to an alarming extent.

A new bank has been organized in Santa Barbara.

Two more schoolhousee are to be erected in Los Angeles.

Mining and Scientific Press.—On the 3d inst. this paper, published by Dewey & Co., at 224 Sansome street, San Francisco, entered upon its thirty-first volume. It is, beyond a donht, the best journal published on the Pacific coast for the scientist, mechanic and miner, and should receive the most liberal support. It costs much money, to say nothing of patience and endurance, to publish an ordinary paper; but the amount required of all these to publish such a paper as the Press can hardly be realized by amateurs or those not having had any experience in the publishing and printing business.—[Panamint News, July 14th.

The Scientific Press—This valuable paper entered upon its thirty-first semi-annual volume on the 3d inst. For mechanics and miners, in fact for all classes of people, we know of no paper which contains more substantial reading matter than the Scientific Press. It is published in San Francisco, by Dewey & Co., at $4 per year. No person interested in mining or other scientific pursuits should be without it, as it is weekly filled with invaluable scientific literature.—[Amador Dispatch.

Patents & Inventions.

A Weekly List of U. S. Patents Issued to Pacific Coast Inventors.

From Official Reports for the Mining and Scientific Press, Dewey & Co., Publishers and U. S. and Foreign Patent Agents.]

By Special Diepatch, Dated Washington, D. C., July 27th, 1875.

For Week Ending July 13th, 1875.*

Newspaper File.—Franklin B. Aldereon, San Jose, Cal.

Gong Attachment for Engine Houses.—Robert Bragg, S. F., Cal.

Floor Clamp.—Elijah Hickmen, Red Bluff, Cal.

Ore Concentrator.—Geo. W. White, S. F., Cel.

Reciprocating Churn.—Alfred Goodnongh and Thomas T. Drennan, Portland, Ogn.

*The patents are not ready for delivery by the Patent Office nntil some 14 days after the date of issue.

Note.—Copies of U. S. and Foreign Patents furnished by Dewey & Co., in the shortest time possible (by telegraph or otherwise) at the lowest rates. All patent business for Pacific coast inventors transacted with perfect security and in the shortest possible time.

BLOOD DISEASES.

The blood heing the source from which onr systems are bnilt up and from which we derive our mentel as well ae physical capabilities, how important that it ehonld be kept pnre. If it contains vile festering poisons all organic functione are weakened thereby. Setthng upon important organs, as the lungs, liver or kidueys, the effect ie moet disastrous. Hence it behooves every one to keep their blood in a perfectly healthy condition and more eepecially does thie apply at thie perticnlar eason of the year than at any other. No matter what the exciting canse may be, the real ceuse of a large proportion of all diseases is bad blood. Now Dr. Pierce does not wisb to place his Golden Medicel Discovery in the cetalogue of quack patent nostrums by recommending it to cnre every disease, nor does he so recommend it, on the contrary there are hundreds of diseases that he acknowledge e it will not cure; but what he does claim is this, that there is but one form of *blood* disease that it will not cure, and that disease is cencer. He does not recommend his Discovery for thet diseese, yet he knows it to be the most searching blood cleanser yet discovered, and that it will free the blood and eyetem of all other known blood poisons, he they animal, vegetable or mineral. The Golden Discovery is *warranted* hy him to cure the worst forms of Skin Dieeases, ae all forms of Blotches, Pimples and Eruptions, also all Glandular Swellings, and the woret form of Scrofulous and Ulcerated Sores of Neck, Legs or other parts, and all Scrofnlous Diseases, of the Bones, as White Swellings, Fever Sores, Hip Joint and Spinel Dieeases, all of which belong to Scrofulous diseeses.

CONFIRMED-HIP JOINT DISEASE CURED

W. Grove Station, Ie., July 14, 1872.

Dr. Pierce, Buffalo, N. Y.:

Dear Sir—My wife first became lame nine yeare ago. Swellinge would appear and disappear on her hip, aud ehe was gradually hecoming reduced, and her whole eyetem rotten with disease. In 1871, a swelling broke on her hip discharging lerge quantitiee, and since that time there are several openinge. Heve had five doctors at an expense of $125, who say nothing will do any good hut a surgical operation.

July 16, 1873, he writes thus: My wife has certainly received a great benefit from the nse of your Discovery, for she was not able to get off the bed and wae not expected to live a week when she commenced using it, a year ago. She has heen doing most of her work for about six monthe. Has used twenty bottles and is still using it. Her recovery ie considered as almost a miracle, and we attribute it all to the use of your valuable medicine. I can cheerfully recommend it as a blood purifier and strength restorer. J. M. ROBINSON.

Discovery is sold hy druggiste.—*Com.*

IMPORTANT

—TO—

MINE OWNERS.

LATEST INVENTION.

New Method of Working Rebellious Ores Without the Aid of Quicksilver.

R. J. KOHLER REDUCTION AND REFINING WORKS CO.

Incorporated April 27, 1874, with a Capital of $5,000,000, in 50,000 Shares of $100 Each.

ESTABLISHED FOR THE PURPOSE OF SMELTING ORES IN AN IMPROVED MANNER, and for the reduction and refining rebellions ores; also, by a newly patented process, producing the precious metals without loss or the use of quicksilver. These Improvements have been fairly tested, and proved successful.

Location of the Worke,

At Damon's Landing, six miles east of Oakland, in Alameda county.

The Company's Property

Consists of just four acres of land, bounded on the east by the C. P. R. R. track (with a switch of 500 feet in length and telegraph at the works), on the west by San Leandro Bay, where the company's wharf can receive all water freights from foreign places.

Buildings.

A frame building, 60x100, well built, divided into business, assayer's office and laboratory, leaving ample room for the manufacture of concentrators.

A one-story brick building, 26x60, with an artesian well in it capable of throwing 45 gallons a minute, a 60-horse power engine and suitable boiler in place, with all necessary appurtenances.

Brickwork.

So far, about 600,000 bricks have been laid on the works, including with the above named brick buildings a chimney, 25 feet square at the base, and roasting, smelting and refining furnaces,

For the Concentration of Ores.

As far as practicable, particularly sulphurets, they will be concentrated at the mine before shipment to the company's works, thereby greatly reducing the cost of sacking and freight; thus enhancing the production of bullion at the works. Among the inventions belonging to the company is a portable and inexpensive concentrator of galvanized iron, capable of being worked by one-horse power and attended by a boy. By means of this concentrator in many cases ten tons of ore can be diminished to one.

Say that five tons of ore yield one ton concentrated, four-fifths of the freight is saved, and ore worth $200 per ton becomes worth.....$1,000

$150 per ton, worth	750
$100 per ton, worth	500
$50 per ton, worth	250

Profits.

It would be difficult to estimate the enormous profits which it is likely this company will realize when the works are complete and in full operation.

Numerous offers have been made to sell ores to the company, which assay very high, that cannot be worked by any process hitherto in use, but can by this company's new process. It follows the company can make their own price on such ores, taking their portable concentrator to the mine and reducing the ores previous to the shipment to the company's works. From one locality, there is a mountain of rebellious ore; the offer has been made to transfer at the rate of 500 tons per day, if required, and to sell the ore, assaying at from one to three hundred dollars per ton, at the rate of 20 per cent. of assay value to the company. The freight on the ore from this locality to the company's works will not exceed $20 per ton.

Capacity of the Works.

Ore can be reduced at the rate of 50 tons per diem until more furnaces are constructed. Taking 50 tons as a basis, at only $33⅓ profit, for 30 days (one month), would give the company $50,000.

All ores can be assayed at the works; orders taken at the office.

As an evidence of the superiority of the Kohler process of reduction over all others, it may be stated that before the incorporation of this company a quantity of micspickle ore, the most rebellious ore to be found in California, was taken and worked by said process, in the presence of a well known metallurgist, and made to yield at the rate of $52.20 per ton.

In many instances the result of working gold-bearing sulphurets exceeds the rate of the most carefully made assays.

Money Expended.

Up to the present time, about $45,000 has been laid out, and only those interested can tell the struggle the inventor has passed victoriously through, amid the cold shoulder from nearly every one. The present state of the works has only been reached by the sacrifice of stock to a large amount; some shares disposed of at par (originally), and others at lower figures, as necessity required. The principal holders of the stock donated about ten thousand shares to fully complete the works, some three thousand of which have been sold at various prices, and the remainder, when sold, will furnish ample funds to enable everything to be in full working order by September 1st. In fact, the roasting and smelting could he commenced by the middle of August.

Looking at these works in a mere hard business view, even as an ordinary smelting R. and R. W., the investment would be a secure one. Costing in all, say some $60,000, when well known smelting works in San Francisco have made a large fortune on the old plan, the various new Kohler inventions give a wide margin for profits.

The fact of reducing rebellions ores in our own State without shipping the same to England, or having the alternative of abandoning the mine, is a strong point; and the Kohler concentrator can be obtained by mine owners at about $3 000 each, in place of paying from $30,000 to $50,000, as they have been doing heretofore.

A few thousand shares remain for working purposes, and can he obtained at the office, southwest corner of Pine and Sansome streets.

There is not the slightest possibility of any assessment ever being made on this stock.

(Signed) H. P. EAYRS,
Secretary.

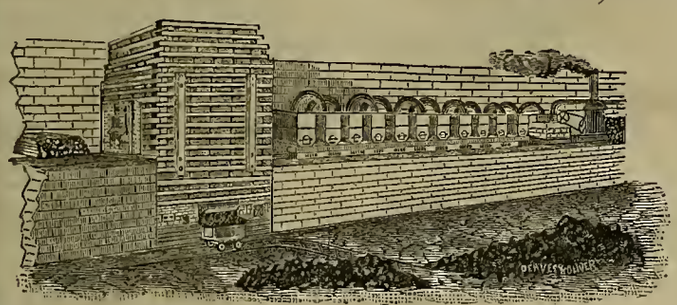
THE KNOX & OSBORN



QUICKSILVER FURNACE.

THIS FURNACE REDUCES CINNABAR, (ROCK OR FINE EARTH,) AND

WORKS CLOSER TO AN ASSAY

And at **LESS COST** per ton than any other furnace. It will work continuously Twelve to Twenty-four months without stopping.

NO MAN HAS EVER BEEN SALIVATED

Or otherwise affected by the mercury about the furnace, either in operating it or making repairs. For ful particulars, plans, etc., apply at

NOS. 19 AND 21 FIRST STREET, SAN FRANCISCO.

We refer any party desiring a good furnace to either of the following Mining Companies where the furnace may be seen in successful operation:

The Manhattan Mine in Napa County.
The Redington Quicksilver Mining Company, Napa County.
The California Quicksilver Mining Company, Napa County.
The Phœnix Quicksilver Mining Company, Napa County.
The Etna Quicksilver Mining Company, Napa County.
The Ida Clayton Quicksilver Mining Company, Sonoma County.
The Annie Belcher Quicksilver Mining Company, Sonoma County.
The Geyser Quicksilver Mining Company, Sonoma County.
The Cloverdale Quicksilver Miniug Company, Sonoma County.
The California Borax Company (Sulphur Banks), Lake County.
The Abbott Mine, Lake County.
The Buckeye Mine, Colusa County.
The Cerro Bonito Mine, Fresno County.

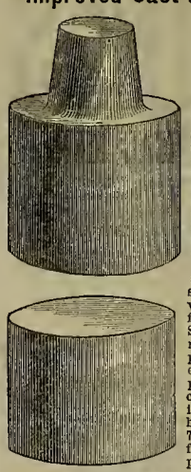
KNOX & OSBORN.

Improved Cast and Forged Steel Shoes and Dies for Quartz Mills.



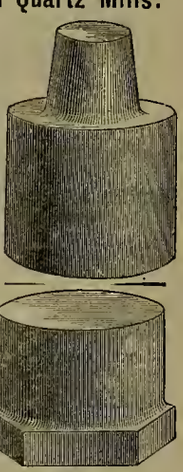
[PATENTED MAY 26TH, 1874.]

Price Reduced to 16 Cents Per Pound.

SAN FRANCISCO, November 10th, 1874.

To Supts. of Quartz Mills and Mining Men generally:

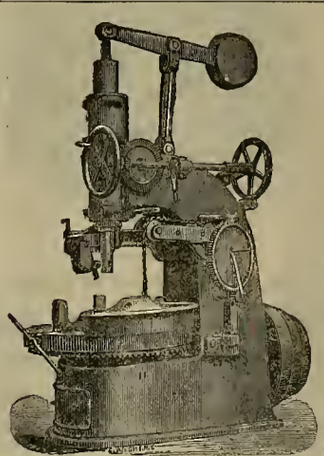
We take pleasure in stating that owing to the rapid increase in our orders, our Pittsburg Manufacturers have been compelled to add largely to their works—a new gas furnace and heavier trip hammer—and are thus enabled to reduce the cost of steel and at the same time produce SHOES AND DIES superior to any yet manufactured. We have consequently reduced the price to 16 cents per pound and solicit a trial order, guaranteeing that you will find them at least 10 per cent. cheaper than the best iron. There are no STEEL SHOES AND DIES made excepting under our patent and sold at this office, or by our authorized agents, though certain Eastern manufacturers advertise STEEL SHOES AND DIES which are only cast iron hardened by the addition of a composition. They will not out-wear two sets of common iron, though called steel. They are very brittle and are not capable of being tempered, flying from under the hammer like cast iron. Our STEEL SHOES AND DIES are in use in many of the largest mills on the Pacific Coast, and all who have tried them pronounce them cheaper and far superior to iron in every respect, even at the old price of 20 cents per pound. Their advantages over iron are cheapness on first cost, increased crushing capacity, time saved in changing and in setting tappets, increased value of amalgam by absence of iron dust and chippings, and a saving of 75 per cent. in freight. It takes 50 days to fill orders from the manufactory East. Price 16 cents per pound shipped at San Francisco. Terms liberal.



Address all orders, with dimensions, to

1v29-3m

CAST STEEL SHOE & DIE CO., Room 1, Academy Building, S. F



No. 4 Car Wheel Borer.

NEW-YORK STEAM ENGINE CO.
MANUFACTURERS OF

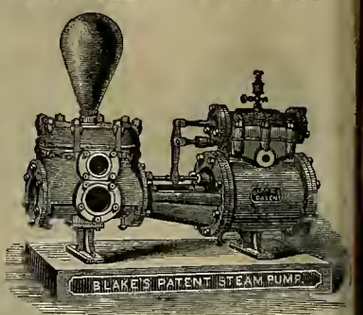
Pure Oak Tanned Leather Belting,

Perin's French Band Saw Blades,

Planer Knives,

Nathan & Dreyfus' Glass Oilers, and Mill and Mining Supplies of all Kinds.

BLAKE'S PATENT STEAM PUMP



Over 7,500 in Successful Use in the United States.

WIRE ROPE

For Mining, Shipping, and General Purposes.

All kinds and sizes on hand, or made to order; guaranteed of unsurpassed quality, and manufactured of any length. FLAT ROPES, ROUND ROPES and TAPER ROPES, of IRON OR STEEL.

Patent Endless Wire Ropeway

(WIRE TRAMWAY,)

FOR THE RAPID AND ECONOMICAL TRANSPORTATION OF ORES AND OTHER MATERIAL OVER MOUNTAINOUS AND DIFFICULT ROADS.

This system has been in use for over three years, and given thorough satisfaction.

PATENT GRIP PULLEY,

For transmission of power by means of wire ropes

WIRE.

Fencing Wire and Staples,
BALING WIRE,
SPRING WIRE,
GALVANIZED WIRE,
BROOM WIRE,
STEEL WIRE,
COPPER WIRE,
BRASS WIRE,

And Wire of all kinds, on hand or made to order.

SOLE AGENT FOR

Richard Johnson and Nephews' Celebrated Telegraph Wire.

Full stock on hand in hond, or duty paid.

Wire Cloth and Wire Netting.

FULL ASSORTMENT ON HAND FOR ALL PURPOSES, AND

All Kinds of Goods in the Wire Line.

VOLUME XXX Number 6.

Process and Quicksilver Furnaces Used at Idria.

Through the courtesy of Mr. J. B. Randol, manager of the New Almaden mine, we are enabled to lay before our readers, engravings of the muffle furnaces used at the quicksilver mines in Idria, Austria, from drawings prepared by Adolfo Exele, imperial mine manager. The attempts formerly made by Mr. Glovazky to burn the soot in muffle ovens, were taken up again in 1869, and entrusted to the care of Mr. Toman, assayer. Mr. Toman succeeded in working the soot advantageously in muffle ovens, combined with a simple condenser, by mixing the same with lime and clay, and running it into moulds. Attempts made also with pulverized ore also gave good results, in consequence of which, six muffle furnaces were erected under one building at Idria, in 1870.

These new furnaces combined many essential improvements upon the original experimental furnace, the working of the latter causing sickness among the laborers, while now, hardly any sickness caused by mercurial vapors exists among the muffle workmen.

Each furnace contains two muffles, which are five feet six inches long, twenty-four inches wide, and ten inches high; and each two furnaces have a common fire place, so that the six muffle furnaces actually form three double furnaces with twelve muffles.

The accompanying engravings on this page and page 89, representing these furnaces are carefully drawn to a scale, so that similar furnaces could be made from these drawings if desired. Figure 1 is an elevation of and vertical cross section through the muffles. Figure 2 is a horizontal section through the muffles, and a plan of the condensing pipes. Figure 3 is a vertical section and elevation of the condensing pipes. Figure 4 is a vertical longitudinal section of the furnaces. Figure 5 is a general plan of the arrangement.

The details are as follows: *a*, is a muffle of cast iron, one inch thick, to be closed with a cast iron cover, properly lined; *b*, is the cover; *c*, anchors; *d*, wedges fastened to the muffle and luted with mortar; *e*, condensing pipes; *f*, water boxes; *h*, gates or faucets; *i*, water circulation pipe; *k*, water pipe for outflow; *l*, gutter for same; *m*, sand filter, to collect scattered particles of soot and quicksilver; *n*, outside gutter; *o*, cleaner fastened to a pole; *p*, stuffing box with rubber packing; *q*, collecting box with cover and lock, filled with water to receive the products of condensation; *r*, pipe leading into chimney to ventilate collecting box; *s*, pipe to run off quicksilver; *t*, vessel with cover and lock to receive the quicksilver; *u*, pipe to lead off gas, conducted under a cloak, and not in direct communication with the chimney, as a strong draft would carry off the mercurial vapors; inside the cloak is a small opening which leads to the chimney; *v*, are the grate bars; *w*, fire door; *x*, ash pit; *y*, fire flues; *z*, register; *a'*, cleaning holes; *b'*, chimney; *c'*, smoke cloak; *d'*, tin protecting sheet; *e'*, chamber to collect flying particles; *f'*, compensating weights; *g'*, discharging box; *h'*, channel to discharge refuse; *i'*, car, which is drawn out by pulleys, so that workmen need not enter the channel.

The crushed ore, averaging ten per cent., is mixed with fifteen per cent. of lime, (the lime being burned and slacked to a powder) then mixed with water and made into bricks nine inches long, four and a half wide and one inch thick. One cental of ore gives about thirty-eight or forty bricks, which are roasted with a moderate red glow heat for four hours. In charging, a protecting tin sheet is placed between the discharging box and the cloak, so that the dust and smoke will not annoy the laborers, but is drawn off immediately into the collecting chamber *e*. There is a pulley attached to the protecting sheet so as to allow it to be easily manipulated.

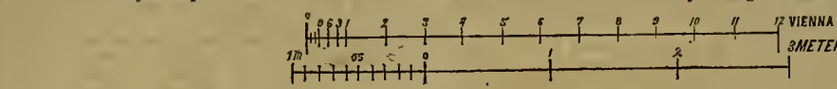

Fig 1

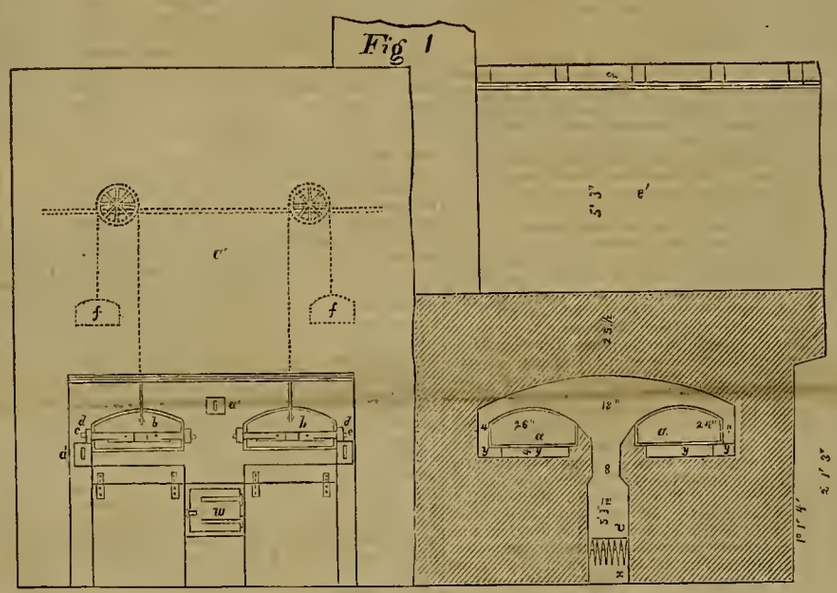

ELEVATION. CROSS-SECTION.

Elevation of, and Vertical Cross-Section Through the Muffles.

Once every day the condensing pipes are freed from soot by inserting the cleaners. The quicksilver is generally collected every other day, yielding from twenty to twenty-four hundred weight, so that the daily product is from ten to twelve hundred weight.

Once a week the soot is taken from the collecting box and the quicksilver freed in a press, generally giving from ten to twelve hundred weight. The residue amounting to four hundred weight is dried and returned to the muffles.

Since the year 1872, the dust-collecting chambers have been connected by underground flues with the central chimney, built in the neighboring hills. Before the chimney was used, however, the dust chambers led to the open air, in connection with other arrangements now out of use, so as to prevent loss of quicksilver as much as possible and save the laborers' health. Before the opening of each muffle the connection with the pipe for leading off gas was severed by means of a regulating knob, *k'*, and connection made with a wooden channel, *l'*, leading along the furnaces, and emptying into two coke filters. The air was pumped out from these, so that on opening the muffle a draft was established through the same.

In these six muffle furnaces, during seven or eight months' operations, some 1,500 tons of ore are reduced, yielding an average of from five to nine per cent.

MUFFLE FURNACES AT THE QUICKSILVER MINES IN IDRIA, AUSTRIA.

The Cost of the Late Strikes and Their Lessons.

It is estimated that the losses incurred by the recent Pennsylvania strikes reach fully ten million dollars; while those incurred by the English strikes during the past season reach fully fifteen millions. This is merely the loss of time to those actually engaged in or driven from labor by the strikes. The indirect losses incurred by those depending more or less directly upon the industry of the strikers and laborers would aggregate several more millions. Moreover, the sufferings of the workingmen can hardly be measured by the amount of wages lost; for the shopkeepers and dealers who have to advance them goods and provisions during the strike must naturally call for liens upon their debtor's earnings, homesteads and other property, which often entails farther losses, to say nothing of the depressing influences which an overshadowing debt invariably casts upon a man, especially if he is blessed with a family dependent upon his labor for their support.

And further, this immense loss is all on one side. That of the mine and mill owners, though vastly less is nevertheless enormous. The owners assuredly gain largely in the appreciation of their products as a direct consequence of the cessation of competition in their productions and are thus largely, and sometimes fully, repaid for their losses.

Hon. John Bright, of England, than whom the workingman has no better friend in either England or America, in answering a note from a Glasgow workingman upon some subject connected with trade unions and strikes says: "A hook, and not a small one, might be made up of the strange doings of trades unions. Monopoly is hard to teach, and I fear that workingmen will only learn through suffering that they can do mischief which cannot afterward be repaired."

Mr. Bright's idea, we believe, is that all such differences should be adjusted by courts of arbitration, the practicability of which have already been fully proven in England.

Apropos to the above, we may, in this connection, call attention to the fact already adverted to in these columns, that these strikes almost invariably call out the spirit of invention, to devise ways and means for capitalists to carry on their operations with less of the hand labor, which they find so uncertain and uncontrolable. As an evidence of the correctness of this assertion we would call attention to the fact that during the late Pennsylvania coal strike a new patent "jigger" for separating slate from the coal was brought to a greater degree of perfection, and bids fair to make rapid inroads upon the collieries of that region, and just as rapidly deprive the industrious little breaker boys (slate pickers) of their occupation. The Schuylkill *Republican* learns that over a hundred slate pickers in Shenandoah alone found no work when the late resumption took place, on account of the introduction of this new machine. The machines do their work well and will prove a great saving to the operators of collieries.

IDAHO, MONTANA, UTAH AND NEVADA.—Mr. Charles T. Bell will visit the above named territory on business for this office. We bespeak for him a full measure of success.

A NEW silk factory is being built at Warehouse Point, Conn.

The Mahogany Mine Trustees in Law.

Suit wes brought in the Fourth District court last week by Charles Forbes and six other stockholders, against the Mahogany mining company, its President, Board of Trustees, etc. The complaint deteils a freezing-out geme, which may expose interesting developments in court. The allegetions are that in 1870 the Mahogany incorporeted to work the Mahogauy mine in Owyhee, Idaho Territory. Thet several times the capital stock has been increased, and the last increase was mede July 1st, 1875, when the stock wes doubled, meking 50,000 sheres. Thet when the company was first incorporated the hy-laws prohibited the Trustees from creating any debt exceeding $25,000. Thet the mine of the compeny wes valnahle, and tbe company were getting along prosperously. Thet the present Boerd of Trustees confederated for the purpose of defreuding the stockholders of the mine. To accomplish this object, they first emended the by-laws so as to give the Boerd e right to contract debts to en unlimited exteut. They then met and privately agreed to purchase some adjoiniug ground at $160,000, which ground, the bill alleges, is not reelly worth more than $20,000. In order to carry out this scheme they had the property conveyed to an outsider, end then authorized the President of the company to purchase it for $160,000. This proceeding wes kept entirely secret from the stockholders who were not in the ring. By changing the time of the annnel meeting, und keeping the chenge qniet, the old Boerd was re-elected, nnd then the stockholders were cajoled into doubling the stock, and into ratifying the purchase et $160,000. The money in the treasury wes then eppropriated to pay for the property, and the company also got into debt to the extent of $100,000. When the stockholders applied for dividends on increased stock they were informed that the stock would all be required for the company's indebtedness. Among some of the stockholders there was the usuel couree of grumbling, but threets of assessmente were launched at them, nud the Secretary said they would be fought with their own money if they sought a legal investigation. Judge Morrison has issued a temporary injunction, restraining the Trustees from selling the increased stock or in eny way consumatiug the purchese.

Interesting to the Student of Mineralogy.

The cross sections of the Sutro tunnel are bringing to light much that will be of interest to the studeuts of mineralogy. The *Independent* seys that lest week after penetrating e belt of andesite the heeder entered into a peculiar strata of greenstone porphyry filled with pyrites which has the peculiarity of presenting elmost n stratified appearance. Not loug since seams of whet has the appearence of regular slate were presented to one of our geologists and they could hardly be made to believe that it ceme from the midst of a volcanic mountain. Among other mineralogical curiosities met with recently was a veiu of red jesper enclosed by a dark green chloritic rock, the jasper containing most beautiful white stars, the reys from which spread out into the jasper with such distinct lines thet it had the appearance of an artificial productiou. At the present writing the header has entered a clay formation treversed by feeders of calcspea and quertz, the letter containing spots of finely-tinted rose-colored amethyst.

Mineral Wool.—A New York paper states that a new inveution has recently attrected the attention of manufacturers. It is the production of so-called "Mineral Wool" from the sparks of e founder's furnece, by blowing the flowing sparks through a current of steam, which will transform them into fine, flexible, end elastic threads, about a yard long. This ertcle, eckuowledged as a first-class non-conductor, is well adapted for clothing in cases where loss or increase of heat are not desired. Although mede out of common sparks or dross, it has a bright white color similar to that of cotton.

A Substitute for Ink has been devised in Berlin, which coneists of points, like the leads of ordinary pencils, that can be fitted into holders. The writiug at first very much resembles leed penoil marks, but moistened immediately assnmes a violet tint, and theu adheres to the paper like ink. As many as six good copies cen be taken from it by means of an ordinary copying prese.

Agricultural Immigration from England.—The Federal Union of Agricultural Laborers in England have appointed a commissiou to proceed to America and make a thorough examination of the Mississippi valley, in order to ascertain how far it is suitable for eettlement by emigrants. Messrs. Odger and Wicks, the deiegates selected for thie purpose, are shortly expected to arrive.

A Long Blast.—The German papers speak of the blowing ont of the Horder mining and smelting compauy's blast furnace, after a continuous run of eighteen yeare end teu months. This is the lergest run by three years that we ever heard of.

Prizes for a New Method of Preserving Plaster Casts.

The Prussien Government has offered two prizes of the value of about £150 (3,000 marks) and £500 (10,000 marks), respectively, for the discovery of a new method of cleansing plester casts, etc., and for the invention of a new material possessing the advantages of plaster, but whioh will not deteriorate hy repeated washings.

The first prize of 3,000 marks is offered for a method which will give plester cests the power of resisting periodioelly repeeted washings, without injuring in the least the delicacy of the form or toe tint of the plester.

Special Conditions.—(*a*) The method must he applicable, in eqnal degree, to all kinds of plaster occurring in trade, and must not diminish the herdness of the cast. (*b*) In order to entirely preserve the delicacy of the form, those materials are abeolutely excluded which do not soek into the plaster. (*c*) It is not uecesaary to preserve the originel color of the plaster; a yellowish tint, or any warmer tint, may he allowed; but the evenness of the color is, at any rete, indispensable. (*d*) Plester casts prepered according to tbe method must stnud repeeted washings with soep and lukewerm weter. (*e*) The method mnst be appliceble to plaster casts of any size and shape. (*f*) Competitors for this prize are to prove the practicability of their respective methods by sending samples; end, if desired, by preparing casts placed at their disposal.

The second prize of 10,000 marks (ebout £500) is offered for a meterial for making casts of ert work possessing the edvantages of plaster, but which, without eny speciel preperation, will not deteriorate by periodically repeeted washing.

General conditions referring to both of these prizes.—The Ministers reserve to themselves the nomiuation of a committee of experts, in order to examine the consignments which mey be received. Competitors are to send with their consignments sealed envelopes, provided with mottoes, aud containing the names of the senders. On the outside of these envelopes is to be written the eddress to which the returned samples or eny communications are to he sent. The consignments which heve heen fonnd to correspond with the conditions stated ehove will become the property of the Government, and the nemes of the successful competitors will he published. The remaining consignments will be retnrned to the address given on the envelopes. Competitors are to forward their consignments to the Royel Prussian Ministry of Public Worship, Instructiou, and Health (Kouigl. Preussisches Ministerium der geistlichen Unterrichts, nud Medicinal Angelegenheiten), not leter than 31st December, 1875.

A New Kinn of Coal.—A test has recently been made in St. Louis of a somewhat recently discovered coal from Arkanses. This coal is called anthrecite, and was tested for steemer use with marked success. Its nse for zinc manufactories was well tried before, but no test of iron smelting has so far been made, or at leest made puhlic. It is said to be entirely free from smoke during combustion, and ie also free from sulphur. Analysis gives 85½ per cent. of fixed cerbon, 8½ per cent. of volatile carbon, and 6 per cent. ash. When burning, the coal it looks like the ordinary charcoal fire—there is intense heat, very little fleme and no oinder. The eshes ere yellow. This enthracite hes been used by the Weshington county zinc works for some time, on account of its great purity. It is believed it would be valuable in brickmaking, and that one bushel of it will equal fonr bushels of coke. The only drawback to its geuerel nse is that it is somewhet difficult of ignition, requires, when used in a furnace, thet the bars shall be near to the boilers, and must have a strong drenght. In point of cost, it is in that market $2 or $3 per ton cheaper thau Pennsylvania anthracite.

Glass and Steel.—Gless eppears to have properties similar to those of steel, which relate to hardening and annealing. We change the temper of a steel tool by heating and slowly cooling. This is jnst what is done in the production of the Bastie glass. We make steel very hard by cooling it very suddenly from a high heat by a bath in cold water. In temperiug a sword blede it is neoessary at one time in the process to cool it so suddenly from a great heat, that the blade, if allowed to drop npon the floor, wonld break in pieces es readily and completely as though it were made of ordinary glass. We probably ae yet have bnt a very imperfect knowledge of the capacities of either glase or iron.

A Crooken Railroan.—It is said that the Colorado Central railroad, which is twenty-one miles in length, is built among the rocks end ledgee, and is known to be the crookedest line ever huilt. At but three places is the track straight, and then only for a distance of 300 feet. It ie moreover eeid that the legislature granted the company a charter as a joke, never expecting that it would be built, yet it has proved a profitable investment to the builders.

To Stick Cloth on Glass. W. G. B. writes as followe—can anyone answer his querry:—I wish to stick some cloth to glase in order to eew it into an article. Will you please tell me what I shall use to hold it firmly? and greatly oblige.

Domestic Motors.

No sooner is oue humen want supplied than enother springs up to teke its place. We have now our washing machines, onr sewing machines and our patent knife cleaners, but still unsatisfied we cry out for a small engine to work these useful servants and to be of use in many ways that will appear when once such an engine has been invented. At first sight it may seem a simple matter and one that would call for not mnch exercise of the inventive feculty, but the fact is thet it will be by no means an eesy matter to fulfill ell the conditions required to be fnlfilled hy a motor of this natnre, and this may be ergued to some extent hy the failure of several attempts already made in this direction. We find the conditions cleerly and briefly steted by e contemporery. They are as follows:

In the first place, then, a domestic motor must be safe—that is, it must be absolutely free from risk of explosion, or fire. In the second plece, it must be generelly applicable. In the third, it must not be likely to get out of order. Fourthly, it must be perfectly under control, and require no special skill to manage it. Fifthly, it must be cleanly in its operation; and lestly, it must he cheap. One or two minor requirements might be steted, but we believe we have enumereted all thet are essential.

It is manifestly not impossible to accomplish all that is here demended, and under certein circumstences it would be by no meens difficult. For instance, here in Montreal where we have a constant supply of water under pressure it would he no very difficult metter to use it for the purpose. Smell turbines might be built and placed in rooms where power was needed—they would take up but little room and would be the been ideal of a domestic motor; cheap, noiseless, perfectly safe, nuder perfect control and absolutely cleen and free from smell. This motor, however, would not be available in all towns or in country places. For these au engine of some other kind would have to be divised.

We have alreedy, in these columns, described e petroleum motor designed to occupy a position somewhat analogons to that we are now considering, but as yet it is not sufficiently tried to enable any decision on its merits to be arrived at. Small steam engines are now being constructed in London for driving sewing machines. These little engines are on the oscilleting principle, and are seid to be extremely simple, and well mede. Steam is supplied by little verticel boilers, heated by a Bunsen burner or ring. No chimney is required, and the exheust steam is carried off by india-rubber pipes. Although the pressure used is low and the boilers small, the arraugem nt cannot be pronounced quite free from danger; and the heat end smell inseparable from the use of steam eud tbe difficulty of satisfactorily disposing of the exheuet must always tell ageinet the popularity of this, or any other form of steam engine, as a motor suitable for drawing-room use, altbough it would, no donbt, prove serviceable in tailoring esteblishments, and other places where a considerable number of sewing machines have to be worked; and it would probably do good service in small leundries.

Hot air seems to be the favorite motor at present suitable to the circumstances. It would be a safe, noiseless motor end the hot air discharged could easily be got rid of or even rendered serviceable in ventilation. These hot air engines could be made very small and yet qnite powerful enough for the purpose, end the cost need not be great. Once a pettern engine has been constructed and proved to be successful it can be reprodnced at small cost, especially if the demand should grow, as it would in ell probability, to dimensions rivaling those of the present sewing mechine trade.—*Mechanics' Magazine.*

An Ancient Library.—Mr. Andrew McF. Davis delivered a lecture before the Young Mens' C. U. B. Society, in this city lately, upon "The First Public Library." The speeker gave a learned review of tne early history of Assyria and Egypt es an introduction to what he considered the earliest public library ever founded in the world. This library was unearthed by Layard in the Palece of Keyinyik at Nineveh. The booke, if they may be so termed, consisted of flat, square tablete of baked clay of varione sizes, from an inch to nine inches in length, having on each side a page of cuneiform letters, many of them eo minute, as to be diecerned only by the aid of a microecope. Each teblet wae numbered and formed a page in a book. The characters were probably imprinted upon the clay while it was still moist. The tablets were found piled in regular order. Upon one of these tablete, now in the British Museum, is the declaration of the founder of his intention to dedicate the tablets to the use of his eubjects. Amongst these tablets is oue containing a petition from some of the subjects of the then ruler, complaining of the peculations of one of the ministers.

Woman Suffrage in Connecticut.—The House of Representatives, at Hartford, voted on the 21st ultimo, 82 to 102, to indefinitely postpone the bill giving women the right to vote in Presidential elections. The advocates of female suffrage here regerd the large vote in their favor ns nearer a victory than any action heretofore taken in any other State, and consider it quite a triumph for their cause that the Committee'e report was unanimously in favor of the bill.

Geographical Congress.

A Geographical Congress iu France will be something new. Frenchmen have from time immemoriel been guilty of charming ignorance of things geographical, which they never deigned to apologize for, further than to eay that their own country was so interesting that they did not need to travel for matters of interest. Voltaire did not scruple to locete the Blue Ridge in the vicinity of Baltimore, and General Ducrot did not know the Marne from the Seine. Bazaine hed never heard of Matamores when he came to Mexico and most of the French still fancy thet the Southern States of our Union are below the Isthmus; bnt they ere changing all those things in France, now that the war is over, and the nation not only keeps atteches busily at work editing popular reports on topography, etc., in most countries, but Paris is making a greet spread over the exhibition of geographical sciences at the Tuilleries, and will over the international congress to be held iu August. The exhibition will he a very imposing effair. All the great countries are well represented.

The idea of this internetional congress was origineted in 1869 by the Peris Society, nnd it was proposed to essemble in Belgium. Ou account of the war the first session could not be held until August, 1870, when there was a large assemblage of notabilities at Antwerp. England was very desirous of securing the second Congress, but as Paris prevailed, a kind of international coolness took plece between England and France, and England has refused to be officially represented. The Russian department of the exhibition is to be remarkebly fine. Among other wonders, Russia exhibits a chart of the oasis of Khiva, end a superb collection of Khiven jewelry and other ornaments. There is now a great passion here for travel and knowledge of other nations; hooks and pictures which describe national hebits nnd characteristics are eegerly sought, and the exhibition will be visited by hundreds of thousauds of people. —*Paris Letter.*

The New Arctic Expedition.

The first obstruction which the expedition is likely to experience will be ceused hy the great ice-park which annually forms in Baffin's hay. This is knowu es the great central perk, and cousists of anoient floe-ice, and of more recent ice, varying from six to eight feet in thioknese. Much of this is broken every yeer by the swell from the south, or dissolved by the warm cnrreut which sets into the bay; bnt the great middle peck, es it is termed, always presents a formidable barrier to the whaling fleets which frequent Beffin's hay—elthough they rarely fail in breaking through it sooner or later, according to the seaeon end the strength and compectness of the ice, which extends from side to side of the bay for a distance of from 180 to 200 miles.

To the north of this formidable obstructiou is that open sea called tbe North Water, and which it is the object of the whalers to reech as early as posible, for there the whales of whicb they are in search ehound, and tbe sooner they come upon their haunte the greater is their success. The ice of Baffiu's bay is not to be compared with that which forms in the seas north of Nova Zembla and Switzbergen, where the edge of tbe peck has been found twenty-four feet thick, and sbeets of from thirty to forty feet tbick are not nncommon.

Baffin's bay has been the scene of frequent disasters to whelers. In 1830 occurred a very terrible catastrophe. A gale from the south-soutbwest drove a whole fleet into Melvillo bey, nipping the ships against the land-floe. As the gale increased the floes overlepped each otber and bore down with accnmuleted force upon the devoted fleet, when a scene of indescribable horror ensued. In the space of a quarter of en hour many fine vessels were shattered to peices—the ice tearing open their sides, meny were squeezed flat, others literally turned inside out. The few which escaped did so only by cutting docks in the lend-floe for their protection. The total loss to the owners was estimated at £143,000.—*Eclectic.*

Fun in Animals.—It is well known that lambs hold regular sports apart from their dams, which only look on composedly at a little distance to watch, and perheps enjoy their proceedings. Monkeye act in the eame manner, and so do doge, the friskinese of which resembles tbat of children. Mr. Leigh Hunt once told Dr. Robert Chembers that he had observed a young spider sporting about its parents, running up to and away from it in a playful manner. He has likewise watched a kitten amusing itself by running along past its mother to whom she always gave a little pat on the cheek as she passed. The elder cat endured the pats tranquilly for a while; but at length becoming irritated, she took an opportunity to hit her offspring a blow on the side of the head, whech sent the little creature spinning to the other eide of the room, where she looked extremely puzzled at what had happened. An irritated humen being would have acted in precisely the same manner.

The Mexican.—When the Ophir mine ehnts down this month, work will also have to be stopped in the Mexican, as the repairing of the sheft will necessarily interfere with the hoisting of the rock.

The Monterey *Democrat* has been enlarged.

SCIENTIFIC PROGRESS.

Molecular Changes in Metals.

Prof. R. H. Thurston, of the Stevens Institute of Technology, Hoboken, N. J., recently contributed a series of articles to the *Scientific American*, in which he gave an outline of the various phenomena effecting the strength of metals used for constructive purposes, and also described some of a peculiar character which have been but recently discovered, such as the character of resistance due to autoraatic action or ordinary use, strain, etc. Reference was also made in those articles to the better known facts that oxidation or corrosion also exercises a most important influence on the charaoter of metals. Instances of this latter class have been frequently alluded to in these columns, such as the fact that old tools, which have been laid aside or lost for a long time, seem to acquire an exceptional excellence. Razors which have lost their keenness and their temper recover, like mankind, when given time and opportunity to recuperate. A spring regains its tension when allowed to rest. Farmers who have left their scythes exposed to the weather, sometimes, from one season to another, find their quality improved by it. Boiler makers frequently search old boilers carefully, when reopened for repairs after a long period of service, to find any tools that may have been left in them when last repaired; and if any are found they are almost invariably of unusually fine quality. The custom of looking about the scrap heaps and under the windows for tools purposely or carelessly dropped, and when one is found badly rusted, it usually proves to be superior in quality to what it was when new.

Prof. Thurston in further alluding to this class of phenomena, in a paper recently furnished to the *Journal of the Franklin Institute*, institutes another striking example as follows:

One of the most striking illustrations of this improvement in the quality of wrought iron with time has recently come to the knowledge of the writer. The first wrought iron T-rails ever made were designed by Robert L. Stevens about the year 1830, and were soon afterward laid down on the Camden and Amboy railroad. These were Welsh rails, and, when put down, were considered, and actually were, brittle and poor iron. Many years later, these were replaced by new rails, but until quite recently some still remained on sidings. When a lot of unusually good iron was wanted, some of these rails were taken up and re-rolled into bar iron. The long period of exposure had so greatly changed the character of the metal that the effect was unmistakable. These facts are stated by gentlemen upon whom perfect reliance may be placed.

The Philosophy of these Changes.

The Professor in continuing his paper says: "But," it will be asked at once, "how can such changes occur without apparent cause, however long the time?" There are probably two methods of improvement, each due to an independent molecular action. In the case of the razor and the spring, which regain their tempers when permitted to rest, it seems probable that a molecular re-arrangement of particles, disturbed by change of temperature in one case and by alternate flexing and relaxing in the other, goes on, much as the elevation of the elastic limit and the increase of resisting power, discovered by the writer and shown on the strain diagram, takes place under strain and set. The other cases may probably be due to a combination of this physical change with another purely chemical action, which is illustrated best in the manufacture of steel by the cementation process. In this process, iron imbedded in charcoal and kept at red heat, gradually absorbs carbon and becomes steel. Here the element carbon enters the solid masses of iron, and diffuses itself with greater or less uniformity throughout their volume. There seems to exist a tendency to uniform distribution which is also seen in a thousand other chemical changes. Many chemical processes are accelerated, checked and even reversed by simple changes of relative proportions of elements, which compel acceleration or reversal as the only means of securing this uniformity of distribution.

When, therefore, wrought iron containing injurious elements capable of oxidation, is exposed to the weather, the surface may be relieved by the combination of these elements with oxygen, and the enclosed interior, by this tendency to uniform diffusion, is relieved by the flow of a portion to the surface, there to be oxidized and removed. This process of flow goes on until the metal, after a lapse of years, perhaps, becomes comparatively pure. Meantime the occurrence of jarring and tremor, such as rails are subjected to, may accelerate both this and the previously described change.

The Gulf Stream.—The deep sea soundings of Lieut. Berryman confirm the prevailing theories concerning the cause of the Gulf Stream. At the depth of 2,000 feet in the straits of Florida, the temperature is only three degrees above freezing, while deep soundings on the telegraph route show a temperature of ten to fifteen deg. below the freezing point. Hence the warmer and lighter water is from the Mississippi crowded to the surface, and is forced toward the colder regions of the North, while the denser water of the North flow south to restore the equilibrium.

The Cruise of the "Challenger."—An interesting and important dispatch from the *Challenger*, dated from Yokohama, reports a continuation of good scientific work on the Pacific. The sea, off the coast of Japan, has been sounded to the depth of over five miles, and even at that depth a sample of the bottom was brought up. It was composed wholly of the silicious shells of a genus of foraminifera. From the general results of these soundings and those made elsewhere, it appears that the bed of the ocean down to 2,000 fathoms is being covered with "globigerina ooze," containing the whole of the carbonate of lime of the shells of the foraminifera living and dying in the water above it, and forming a deposit of almost pure carbonate. Below that depth, in some way not ascertained, the deposit loses more or less of the lime, till at 2,600 fathoms there is found only pure red clay, a silicate of alumina and iron, with silicious tests of animals; from thence to the lowest depths the proportion of clay decreases and that of silicious shells increases, until the clay becomes little more than a cement binding the shells together. This single result throws a wonderful light on some important geological problems. Another valuable biological fact is that foraminifera and diatoms inhabit the water the whole way down, and it is even suspected that they may be more abundant in the lower depths. Two remarkable discoveries in connection with the temperature of the waters of the Pacific have also been noted. A surface layer of eighty fathoms mean depth, heated to above seventy-seven deg. Fah., and extending northwards from the coast of New Guinea about twenty deg., and westward as far as the meridian of the Pellew islands, has been ascertained to be moving westward more or less rapidly. A great part of the Western Pacific has been shown, by the serial temperature soundings, to be not entirely in free communication with the Southern Sea, for the water after sinking rapidly in temperature until it reaches 34.5 deg. Fah., at a depth of 1,500 fathoms, maintains that temperature for all greater depths.

Spectroscopic Analysis.—The first application of the spectroscope in quantitative analysis has been made by Sir John G. N. Alleyne, of the Butterly iron works, near Alfreton, Derbyshire, and the result of his researches (in which he has been ably assisted by his son, Mr. Raynold Alleyne) was embodied in a highly interesting paper, read before the Iron and Steel Institute recently. The mode of procedure may be briefly explained thus: With a modification of the Becquerel tube, and in an atmosphere which will not support combustion, he first observes the line given in the spectrum by a body containing a known quantity of phosphorus, and then substitutes the body containing the unknown quantity of phosphorus to be determined. The phosphorus lines are just blotted out by introducing hydrogen into the tube, and restored by replacing a portion of the hydrogen by a measured quantity of carbonic acid. The quantity of phosphorus is inversely as the quantity of gas used. He can estimate in three minutes quantities under 0.500 down to 0.020 per cent. or less, with accuracy; above 0.500 requires further investigation, owing to the great power of the phosphorus lines. For the determination of small quantities of phosphorus in iron or steel, Sir John Alleyne's discovery is valuable, and may be regarded as laying the foundation of quantitative spectrum analysis generally.—*London Mining Jour.*

Intensity of Colored Lights for Illumination.—Some experiments have recently been made at Trieste with a view of testing the intensity of colored lights, and of white light with different oils. While no doubt was entertained that the best effect with lights at a distance was had with white light, and the next best with red, it was desired to ascertain the comparative utility of other colors for harbor lights. Small hand lanterns were used with white, red, green, deep and dark blue glasses. With the whits were used American petroleum, paraffine and olive oil. At half a mile distant the dark blue was quite invisible, and the deep blue hardly visible (showing their uselessness for illumination at sea.) The experiments made to a distance of two nautical miles, gave the following results: 1. That white light with petroleum is more intense than with paraffine; the latter also went out several times, so it lacked the necessary certainty. 2. That among the lights with olive oil, the red was the brightest—after the white—and the green (Bohemian make) after the red. The green light may at short distances alternate with the white.

Messages from the Sea.—Mr. Garside, of Southport, describes in the *Pharmaceutical Journal* of the 19th inst., the method he successfully employed for restoring the legibility of a letter which had been submerged in the wreck of the *Schiller*, and was quite illegible until submitted to the process described. The letter was carefully brushed over with a solution of sulpho-cyanide of potassium (one in twenty), and then, still damp, held over a dish containing hot hydrochloric acid. The writing was thus developed of a deep red color. The *rationale* of the process is this: The iron of the ink is precipitated as peroxide upon the fibers of the paper, and remains when all other coloring matters are washed away. Being in an insoluble form, however, no effect is produced by the re-agent until the fumes of the acid have rendered it soluble. Probably ferrocyanide of potassium would answer as well or better than sulphocyanide.

Man as Compared with the Steam Engine.—The useful effect of steam is not far from ten per cent. of the theoretic value of the coal consumed in its production, while careful estimates fix the efficiency of the human person—which is nothing more nor less than a machine—at about twenty-three per cent. of the value of the food consumed. The human machine, then is greatly superior, in its efficiency, to the steam engine, giving out more than twice the per centage of work; but it is vastly more costly. According to an elaborate estimate made by M. de Saint-Robert, recently published in the *Revere Scientifique*, of work performed by a man, it would be necessary to employ eight men to obtain one horse power. Estimating the cost of coal at ten dollars per ton, and the wages of a man at the very low rate of forty cents per day, the expense of this amount of power (one horse power) for a day of eight hours would be about ten cents for the steam engine, and three dollars and twenty cents for its equivalent of eight men.

Magnetization of Rails on Railroads.—It has been observed that the nearer a rail is placed in the magnetic meridian, the greater the intensity of its magnetization; and this is whether laid upon the track or thrown together in piles. This fact may be readily observed by examining rails where they are laid upon a curve in the road, the more they may form a north and south direction, the less intense is their magnetism. The effect is more intense in steel rails than in those of iron. Rails or bars of iron become permanent magnets under the action of the hammer. This effect is produced in rails by the jaring and handling of the trains in their passage.

MECHANICAL PROGRESS.

Economy in the Use of Fuel.

In a paper on economy in the use of coal, lately read before the Royal School of Mines, Berlin, we find the following synopsis of interesting historic facts: The progress in the economical consumption of fuel in the last fifty years has been enormous, and has been effected in great part by metallurgists; and here again we find the scientific men taking the lead. In the economical application of the heat developed by fuel, the Bessemer process is enormously effective, not more than ten pounds of coal being requisite for the production of 100 weight of steel from pig iron by this method, while in the older process, still in use for fine qualities of steel, 250 pounds are needed. Siemens, by making the heat which would escape through the chimney of an ordinary furnace warm the fuel and the air necessary to combustion, obtains an economy of two-thirds the weight of fuel. It was Faber de Faure, an accomplished Bavarian metallurgist, who first made practical use of the gases which formerly escaped in immense quantities from the tops of blast furnaces, and the enormous blast engines, the hoisting engines, pumps, and hot-blast stoves, even the roasting kilns of such establishments now-a-days require no fuel except this long neglected waste product. Bischof, another German engineer and metallurgical author, was the first to produce gas artificially for smelting purposes, and this was certainly one of the greatest advances ever made in our art. By first turning it into gas, fuel can be much more perfectly consumed than in the solid form, and hence can be made to give us, as in the Siemens furnace, in which only gas is need, a much higher temperature than is practically attained by the combustion of coal in the ordinary way; but perhaps the greatest advantage of gas is that substances in general scarcely regarded as fuel at all can be employed for the production of gas with the most brilliant results, a matter of the greatest importance, especially in a region destitute of true coal, like California. Lundin, a noted and thoroughly educated Swedish metallurgist, has taught us how to produce gas from wet sawdust, entirely without preparation, of such power that wrought iron may be melted with it, and the great difficulty is to find any material infusible enough to answer as a lining in the furnace where it is consumed. Some idea of the importance of these improvements will be had from the fact that the economy in fuel effected in England alone, in the year 1872, as compared with 1871, by the progress made in the introduction of more perfect apparatus, represented more than 4,000,000 tons of coal.

Cheap Light.—A Russian claims to have discovered a process for producing light by electricity, which is thus described: A small tube of glass not more than six inches in length, is filled with a pencil of charcoal, the air is exhausted and the tube hermetically sealed. A moderate current of electricity is then passed through the charcoal from an ordinary electro-magnetic machine, causing it to glow with a very brilliant, but at the same time soft light. It is said the charcoal does not apparently suffer consumption, but lasts for an indefinite period, and that the strength of the current required is so small that 200 of these lights, at a considerable distance apart, can be easily maintained by a single machine. The inventor claims that he can light the whole city of St. Petersburg, both street lamps, stores, and private residences, by a single fifteen horse-power machine, with no greater cost than that of running the machine.

Iron and Steel Belting.

The question has been asked us whether the use of the band saw for sawing logs is practicable. We have certainly illustrated, more than a year since, a saw mill of that very description, and as the thing has actually been done, the question may in that sense be regarded as fully answered. Like all other improvements or innovations, this method of sawing is subject, as regards economy of power, efficiency, and quality of work, to the test of experience. We know of nothing to its disadvantage in these respects, but merely place it among the devices the value of which is not yet thoroughly ascertained and demonstrated, and which are doubtless susceptible of still further improvement.

But not only have hand saws been used with success for heavy work, but another application of a metallic band of essentially the same nature has been made, and it is said with satisfactory results. We refer to the employment of a belt of sheet iron instead of leather or rubber for transmitting power from one pulley to another. This has been done in at least one instance on record, and the operation of the belt is reported to have met all the requirements of the work. The pulleys in this case were of cast iron; and it is suggested that if pulleys with an elastic surface were employed, still better results would be obtained. The substitution of steel belts in place of cast iron is also recommended as at least an experiment worth trying; and the fact that in the case of a band saw the saw itself transmits the power by its friction on the lower pulley, as high as fifteen-horse power being in some cases effectively transmitted by such a saw, is pointed out as a proof of the entire adaptability of steel to belting purposes. The tensile strength of low steel is such that it is calculated that a belt of this material one foot wide and one-sixteenth inch thick could with a perfectly safe working strain—the same in proportion to actual strength which is allowed in ordinary belts—transmit 900 horse-power. So far as ability to bear tension is concerned, this is certainly enough and to spare. The various mechanical difficulties which may suggest themselves to the reader are liable to occur have in a great degree been overcome in the manufacture of band-saws, for which almost precisely the same conditions, facility of joining and general management are required as would be called for in belting for any class of work.—*Leffel's Mechanical News.*

Cannon vs. Cuirass.—An experiment made in Herr Krupp's artillery grounds at Dulmen seems to threaten the future of cuirassed vessels. Hitherto, it is well known, the solidity of the cuirass has pretty well kept pace with the calibre of the ordnance destined to do the work of destruction. By a felicitous idea, however, the force of the cannon has now been quadrupled. The invention, if so it may be called, consists in directing four guns towards the same spot, and firing them simultaneously by electric ignition. To test this new method, a target was constructed by Herr Krupp consisting of two 10-inch plates, a wooden layer 200 millimetres thick, two 6-inch plates, and another layer of wood 200 millimetres thick, the whole lined by an iron layer 1½-inch thick. At a distance of 200 metres from this target were placed four 26-centimetre cannon, the calibre of which may be imagined from the fact that each requires forty-two kilogs. of prismatic powder. The first simultaneous discharge of the four guns, which were loaded with long cubic grenades, tore away large pieces of the iron plates, and so shook the target as essentially to diminish its resisting power. Other discharges seem to have had an even more destructive effect. As the power of the German breech-loading gun is greatest at 400 metres, at which distance the naval engagements of the future are likely to open, the Dulmen experiment is supposed by some to have decided the long pending controversy of cannon *versus* cuirass.

When steam navigation began, the wildest speculations were indulged in as to speed; but all of them were doomed to be falsified by the results. With the hosts of improvements yearly adopted, the original speed of eight miles per hour has scarcely been doubled. On the average it has not; the fastest ocean-going steamers only accomplish fifteen miles. In smooth rivers and in narrow channels much higher rates of speed have been obtained; but the average of all kinds of steamers, river and ocean is from twelve to sixteen miles per hour, and the problem that still vexes engineers is how to obtain a much higher rate of speed. When that will be solved no one can tell; the ocean is a mighty monster, and will not readily be subdued.

A Substitute for Diamond Dust.—Amongst the recent inventions is one which a Mr. Mackintosh has patented. It will command a large amount of attention, as it converts what is at present a very high cost into a comparatively insignificant one. It is a method of hardening glass to such an extent as to render it an efficient substitute for diamond dust. This important result is obtained by cooling the glass in refrigerating moulds.

Oil Instead of Steam.—An engine is said to have been invented in Paris which is driven by the alternate expansion and contraction of oil in cylinders, the liquid being expanded and contracted by alternate streams of hot and cold water. How the inventor provides for economy of heat and meets the loss of momentum which must result from the want of instantaneous action on the part of his primary forces, is not stated.

Mining Summary.

The following is mostly condensed from journals published in the interior, in proximity to the mines mentioned

California.

AMADOR.

Sharp and Boxall Mine.—*Dispatch*, July 31: A supply of piping has just been placed on this mine, belonging to Dr. Sharp and Wm. Boxall, which is located about two miles above town, on Jackson creek, preparatory to hydraulicing on a pretty large scale. We understand that they will probably be ready to commence the work in about ten or twelve days. If this mine should prove a success, and it is likely that it will, there will probably be a number of new mines opened in the same vicinity very soon.

Volunteer Mine.—*Foothill Ensign*, July 30: During the past week we took occasion to visit the Volunteer claim, situated near the Kennedy mine. The mill, near Jackson, and distant half a mile from the mine, has been running about a week. It has five stamps, and works to a charm. Some trouble is experienced with the new ditch which supplies the water, but this is always the case with a new ditch. It is supplied with the waste water from the Oneida mine. Everything is working as smoothly and successfully as could be expected, and shortly the mill will get through its ten tons of rock per day regularly. The mine is not being worked at present, owing to the fact that there are 300 tons of rock ready for milling.

Maximillian Mine.—This location, at present but little known, promises to make its mark in the future as one of the paying mines of the county. It is situated about half a mile above town. It is supposed by many to be disconnected from the great quartz lead upon which permanent mines are located, and to form part of another gold bearing vein, smaller in size, but apparently richer in mineral. The ledge met with on the surface, in spite of all predictions that it would pinch out, has continued to reach down into the earth, manifesting no sign of exhaustion. Last week, at a depth of 80 feet, a decided improvement took place, the ledge expanding from a mere spur or off-shoot, and assuming the dimensions of a distinct lead. The ore is exceedingly rich, some of it near the surface was worked last winter in one of the old mills near town, and notwithstanding the poor facilities for saving the precious metal, a fair margin of profit remained after paying expenses of working. No rock has been worked recently, but an assayed sample taken 80 feet from the surface, yield at the rate of $95 to the ton.

ALAMEDA.

Machinery for the Coal Mine.—Livermore *Enterprise*, July 31: Considerable machinery belonging to the Livermore coal mine was received and sent up to the mine last Monday. The superintendent is using all exertions to push the work ahead, and the bunkers—or coal receivers—are being built, and the general timber work is advancing. Several houses have been erected at the mine, and already a great deal of stir and business is manifested up that way. The coal has improved very much of late.

ALPINE.

Illinois-California.—Alpine *Chronicle*, July 31: Work on this claim was started up on Monday last, under the superintendence of Joseph Lane. This claim is situated in the Raymond mining district, and about two miles from our town. It is the intention of the company to prosecute the work of development with energy. The old tunnel will be pushed to the ledge, which is not far distant from the present face of the tunnel.

The Exchequer.—Mr. Remaine, of London, has been examining the Exchequer and other mining property belonging to English companies, and is satisfied that the reports concerning the Exchequer are not too highly colored. The company will begin shipping bullion before winter sets in.

CALAVERAS.

Mining Items.—*Citizen*, July 31: The well known "Woodhouse" mine has been purchased by Mr. Charles Underwood, of Monterey, and a 15-stamp mill is now being built thereon. The mine has been under development for the past four years by the former owner, C. Bailey, and a large amount of ore accumulated on the mine. The mine is opened and prospected by tunnels, levels, shafts and open cuts, for its entire length of 3,000 ft; and about 4,000 tons of ore stand now ready for the mill. Superior advantages for cheap milling are connected with this property. A first-class water power is connected therewith, and the ore on the most liberal estimate can be milled for not exceeding $1 a ton. The records at the Harris mill show, that some 250 tons of ore worked there gave from $31 to $72 a ton. The company, in future to be known under the old name of "Woodhouse" gold mining company, is held by three parties, Mr. Underwood holding control. Mr. John Rider, millwright, of Mokelumne Hill is now engaged in building the mill for the company, the mill is to be of the most approved pattern, and all the modern improvements for the saving of precious metals are to be added to the batteries.

COLUSA.

Quicksilver.—*Sun*, July 31: The furnace of the Abbott mine has been shut down for the purpose of putting on an improvement, which it is thought will increase the capacity for smelting over about one-third. We understand the Messrs. Rathbun have struck a more extensive body of very rich ore in another claim, just south of their original ore. The ore they had in their first claim is as rich as it can be, and there was a good amount of it, but the new one is said to be very extensive.

CONTRA COSTA.

Satisfactory Result.—*Gazette*, July 31: We learn that the result of grinding some 1,700 pounds of the uncelected Lafayette rock, in the arastra, last week, was an amalgam button of gold and silver of about $6 in value. Considering that it would necessarily require a considerable amount of amalgam to charge the crevices of the arastra—constructed rudely of stones—it is surprising that anything of value should have been secured from the first run, or even from several runs of rock no richer than this was supposed to be; and a result such as is reported, cannot but be regarded as assuring to the best expectations of the prospectors.

EL DORADO.

The New Ditch.—*Republican*, July 31: The mammoth ditch being constructed by the El Dorado water and deep gravel mining company, and upon which 1,500 men were employed both last season and this, is rapidly approaching completion, and will doubtless be completed in October. In view of this fact, all those who desire to avail themselves of the direct benefit of this greatly increased water supply, should begin preparations for the use of it upon their mining claims, ranches, etc., at the earliest moment. The company will have a large amount of water to dispose of, and cannot afford to allow it to go to waste for any great length of time.

FRESNO.

Mineral Matters.—*Expositor*, August 4: The mining interests are looking up somewhat. We learn that the Ne Plus Ultra copper mining company are now taking out an excellent quality of ore—some of it assaying as high as 30 per cent. The incline has attained a depth of 100 ft on the ledge, and at that depth the ore vein is much wider than the shaft, which is 6x6. A large deposit of high grade ore is in sight. The Confidence quartz mine is improving in appearance as the shaft goes down. The ore now being extracted shows largely in free gold and sulphurets. The Champion mine, on Big Dry creek, is also showing better ore. The mill has been running for some three weeks, and a clean-up will be made in a few days. The owners confidently expect good returns. In the Coast Range, quicksilver mining is prospering. The New Idria mine is running, as usual, a large force of men, and turning out its usually large quota of quicksilver. The Cerro Benito mine is looking more promising. Recent developments in the Little Panoche mine inspires confidence in the stockholders. The Fresno mine is prospecting, and indications are favorable for one of the richest mines yet opened. A number of new quicksilver mines have recently been located.

INYO.

Sales in the Darwin District.—*Independent*, July 24: Two important sales were made recently in the Darwin district. The transfer of 1,050 ft of the Invincible for the consideration of $5,000; the Bella Union and 1,250 of the Raleigh for $15,000 gold coin. George W. Grayson was the purchaser. The Invincible is situated about 1,000 ft from the famous Christmas Gift, the Bella Union 2,000 ft from the Lucky Jim, and the Raleigh about 4,000 ft north of the Grand.

Items from Panamint.—*News*, July 28: We took a trip on Monday last to the mill and mines of the Sunrise company, and found everything in a very forward state. The finishing strokes are being put upon the mill, and the probabilities are she will be running in about one week from to-day. We took a walk over their new road from the mill to the mines, and found it has a most excellent grade; one span of horses will be able to haul all the ore to the mill that can be put into a wagon. Arriving at the Sunrise mine we found a splendid iron track railway had been constructed from the road to the mine, which will greatly facilitate the handling of the ore. It is automatic, only one man at the brake being required to operate the whole thing. One or two more openings have been made, exposing a much larger body of ore than was expected, and showing splendid indications of true foot and hanging walls. The company have out 200 tons of ore, and there are probably 1,800 to 2,000 more tons in sight, in the different outs and openings of this mine that will mill over $100 per ton. From experiments made with this ore the superintendent is satisfied that they will be able to work it up to 65 per cent. of its value, without roasting.

The Twilight, another of this company's mines, is situated some five or six hundred yards northeast from the Sunrise. A shaft has been sunk on this mine to a depth of about 40 ft, going down on a rich body of ore all the way. They have out on this dump about 100 tons of ore, which is probably equally as good as that of the Sunrise. The ore was taken from the shaft and two or three cuts or openings. These two mines are certainly very valuable property, and if the immense ore bodies now being developed continue to hold out, even to a depth of 40 or 50 ft, a mill of four times the capacity of the present one will be required to work the ore.

We next visited the Emma, belonging to Everleth & More, which is situated about two hundred yards to the east of and about equidistant between the Sunrise and Twilight. But little work has been done on this mine, but enough to expose a splendid body of free milling ore that will work about $150 per ton. A road to reach the mine can be made at a small expense, to connect with the road of the Sunrise company, and some 300 yards therefrom. We think the Emma will prove to be one of the big mines of Panamint. We returned to the residence of the gentlemanly superintendent of the Sunrise company, and it being the 'witching hour of lunch, we were invited to a repast, and being tired and hungry we set down and did full justice to the viands in the appeasement of a voracious appetite. This company is deserving of the greatest success, which we heartily wish them, and believe they will soon realize.

MARIPOSA.

The Green Mountain Copper Mine.—*Citizen*, July 31: About the years 1860, '61 and '62, the mine situated near James' ranch, is known to have yielded a vast amount of copper ore, which was smelted and sent to San Francisco. Afterwards, owing to depreciation of copper, and the exceeding high cost of transportation, which at that time was entirely dependent on teams, the works were suspended, and but little has been done since, except by Mr. Harry De Groot, who a few years back extracted from the Green Mountain copper mine, which is in the vicinity of James' ranch, considerable copper, but owing to the amount of water and the lack of facilities to drain the mine, work was suspended up to within a few months since, when under his management, the work upon the mine was again resumed, and within the short space of three months, he has caused a tunnel to be driven 220 ft, and this, too, through what is termed mica, schist and hornblende rock, which required powder and fuse every inch of the way. The tunnel, when completed, will be 475 ft long. Mr. De Groot expects to run the remaining 155 ft in about forty days. The work at present gives employment to eighty men, and is expected that when the tunnel is finished, and the drainage of the water from the mine is perfected, employment will be given to a greater number of men.

NEVADA.

The Fryer Reduction Works.—*Foothill Tidings*, July 31: The reduction works near Glenbrook park, in which will be used the Fryer process, will be put in operation before a great while. The company will commence to put up the machinery next week. The boiler work, which is said to be the largest job ever done in the county, was made by Joseph Bonnivart, of Grass Valley, who has erected buildings for doing the kind of work required by the company in the future. The engine boilers were made at Lakenau's foundry, Grass Valley, and the heavier castings were made by the Occidental foundry, San Francisco. There will be sections enough put up now, to reduce 10 tons of ore per day. Thorough tests will be made at the present locations, after which the machinery will be removed to some mine in the county. The inventor has perfect confidence in the success of the process and expects ere long to be able to prove to the most credulous that what has heretofore been claimed of the process is a fact, and that the waste of at least 50 per cent. of gold, which has for years been going on with the old system, will be stopped, and that mines now idle will again pay liberal dividends. So saith the *Transcript*, and let us hope this confidence may not be misplaced.

Product of the New York Hill.—Grass Valley *Union*, July 28: We saw 3 bars of gold, bearing as that, in the possession of Mr. John D. Meek, on Monday evening last. The bars were made of gold which came out of the New York Hill mine, and the gold was obtained by a partial clean-up of the mill after 10 days' run. The value of the gold was about $11,500. The sulphurets which are heavy and rich are yet to bear from. And splendid ore is still coming out of the New York Hill mine.

Good Clean Up.—Grass Valley *Union*, August 4: A clean up was made at the Empire last Saturday, after a run of 21 days by the mill, and the result is about $23,000 of gold. This pay is largely profit. The underground appearances of the mine are most excellent, and we believe that the next month's work will show a gain over last.

PLACER.

Mining Items.—*Argus*, July 31: The St. Patrick mine is taking out splendid rock at present, and their mill is in perfect working order. Everything looks encouraging for a good run.

The Good Friday mine is just now taking out better rock than they have ever done before, and the superintendent, J. M. Bryan, entertains the highest hopes for striking pay soon.

The Greene mine is also looking well. The rock continues good. The mill, which is the best and most complete in the district, is running constantly.

Iron.—*Herald*, same date: The iron mine, near McDonald's mill on Bear river, discovered last winter, and which is owned by a Sacramento company, gives indications at present of being a big thing. The work of development, we understand, is to begin at once, and with the assistance of cheap fuel, which the Lincoln coal mine will furnish, the company have no doubt but they can make the mining and smelting of iron an extensive and highly profitable business.

SIERRA.

The Charcoal Ledge.—*Mountain Messenger*, July 31: Sam. Stephenson and others are prospecting on the old Chsrcoal ledge situated about 3 miles west of the Ksystone mill. They have a tunnel in nearly 300 ft and expect to tap the ledge before long. The rock paid $75 per ton, working in an arrastra, but the ledge there being broken up, work was stopped.

SONOMA.

Mining Items.—*Russian River Flag*, July 29: The Grest Eastern fired up its five retorts last week and they are now turning out four flasks of quicksilver a day.

The Redington quicksilver company has declared a dividend of $10 a share, payable on the 31st inst.

The Calistoga *Press* learns that the Live Oak claim, near Cloverdale, has been bonded to Dr. Blotchly and others. The claim contains large deposits of green marble of a very valuable character.

The tunnel in the Sequal mine is in about 140 ft and is not yet to the ledge. Work is suspended for the present.

TUOLUMNE.

A Rich Strike.—Columbia *Independent*, July 31: The Reed Brothers & Co. have made another rich strike on their pocket vein, located on the south branch of the Stanislaus river, above Pine Log, and opposite the junction which Red Gulch forms with the river. Last week they took out 18 pounds of gold. To show the richness of some of the rock: they say that from two charges put in an ordinary sized prospecting mortar and crushed, yielded five pounds of gold when smelted and cast into a bar. How extensive this pocket may be they do not know, although they are very sanguine, and believe, with the showing at present, that it will yield more gold than any of the pockets yet discovered on the vein.

Shipment of Quicksilver.—Santa Rosa *Democrat*, August 4: The reports of the Great Eastern mine at Guerneville, started on July the 23d. The capacity of the retort is 2 tons of ore, and 5 flasks of metal. The result is considered extremely satisfactory; the product up to August 3d, from July 23d, was 44 flasks, 33 of which were brought to Santa Rosa by the company teams, and was shipped on Tuesday to San Francisco. And still another source of revenue comes from the great Redwood belt of Sonoma. When the timber is cut from the surface, years hence, the mines will perhaps just be reaching their maximum production. The Great Eastern is constructing an experimental revolving retort on the Wallridge improved patent. This retort will have a capacity of 8 tons a day.

Nevada.

WASHOE DISTRICT.

Consolidated Virginia.—Gold Hill *News*, July 29th: Daily yield, a little over 600 tons, principally from the 1400 and 1500-ft levels. The various stopes and breasts are holding out splendidly, and merely showing more and more ore as farther worked and developed. At the 1500-ft level the great ore deposit is being breasted out further to the southward than heretofore, and the cross-cuts east and west at the 1500-ft level, where it is intersected by the winze from the level above, are both in very high grade ore as yet, of course not defining its extent at that point. The north drift at this level is also driving ahead in rich ore. Work at the joint C. & C. shaft is progressing at the usual energetic rate. It is 547 ft deep, and the foundations for the new and powerful hoisting and pumping machinery are rapidly approaching completion.

Chollar-Potosi.—Ore extraction and hauling to the mill was resumed last Thursday, the daily yield being over 65 tons. Prospecting at the three lower levels is actively going forward, and the main incline is being advanced downward as fast as the hardness of the rock and extreme heat will allow. At the 1150-ft level the drift south is advancing at the rate of two and a half feet per day, in very hard rock. At the 1250-ft level, south, toward the north line of the Bultion mine, the daily advancement is about five feet, in easy working vein material, principally porphyry. At the 1350-ft level drifting south is well started and advancing finely, with the face in porphyry.

California.—The various drifts and crosscuts at the 1400, 1500-ft levels shows no particular change to note since last week's report, except instances for the better. In fact the continued progress of development simply justifies all predictions as to the extent and richness of the portion of the big bonanza contained in this mine, made from the very first.

Crown Point.—Daily yield, 500 tons. The old ore sections hold out finely as yet, and bid fair to do so for some time to come. The main drift east at the 1700-ft level has not reached the ore vein yet, but is calculated to be within 50 ft of it; rock in face of drift very hard and tough. The Rock Island mill, which has been shut down for the past two weeks in order to alter and prepare it for working the ore by the Patchen process, is in running condition again.

Belcher.—Daily yield 450 tons from the old ore producing sections, which continue their regular yield with no particular change to note for better or worse. At the 1,500-ft level the north drift from the winze has reached the Crown Point line and ore extraction from that level will be commenced as soon as thorough ventilation is secured and the requisite arrangements made. At the 1,600-ft level the drift east from the main incline is to-day in 74 ft.

Utah.—The cleaning out and repairing of

the main shaft being completed, the heavy sinking pump has been lowered to its intended position, and is now operating very effectively in keeping the shaft free of water. The repairs to the old hoisting engines and their foundations are nearly completed, and is about a week all will be in readiness to resume sinking the main shaft. Drifting and cross-cutting at the 400-ft level will be resumed at the same time.

OPHIR.—As stated in our last report, ore extracting and all other work in this mine is suspended for the present, until a considerable section of the main shaft is retimbered. This is being actively done, and at the same time the hoisting and pumping machinery at the surface is being arranged for more effective work than ever.

BULLION.—The ore indications and prospects developed by the drift from the 1700-ft level of the Imperial continues to improve as the drift advances northward, following the west wall of the vein. The cross-cut also continues its good showing. Fine progress is being made in cleaning out and repairing the old incline down to the 1400-ft level.

IMPERIAL-EMPIRE.—The ore body developed between the 1750 and 2000-ft levels shows better in value, extent and importance as the drift advances north from the winze. The ore extracted in running this winze is saved for milling. No cross-cutting has been done as yet.

DAYTON.—The heavy shafts and gearing of the new hoisting and pumping machinery are in position, and the hoisting engines will probably start into operation about the middle of next week.

BALTIMORE AND AMERICAN FLAT.—At the 400-ft level the south drift is steadily advancing with no important developments. Sinking the main incline below the 900-ft level progresses well.

NIAGARA.—Twenty-four ft more have been added to the depth of the main incline shaft this week. No change in material. At the 150-ft level a station has been opened and the drift is now in 12 ft with the face in fine ore.

ROCK ISLAND.—The new lower level started from the 550-ft station of the shaft is being pushed ahead at a lively rate. Drifting both north and south at the 450-ft level progresses well.

KNICKERBOCKER.—Excellent work is being done by the pumps.

CALEDONIA.—The old incline having attained a depth of 400 ft below the 1000-ft level, sinking deeper was discontinued last Friday, in order to put in new hoisting cables, and make certain necessary changes in the machinery. The new works will be ready to start by the middle of September.

BEST AND BELCHER.—Owing to an overflow of water, caused by the breakage of the Gould & Curry pump, the work of cutting down and grading the drift connecting this mine with that, at the 1700-ft level, was considerably interfered with.

YELLOW JACKET.—The north drift, at the 1740-ft level, is still advancing in porphyry and quartz. The south winze is down 111 ft to-day with the bottom in porphyry, and a slight increase of water.

NORTH CONSOLIDATED VIRGINIA.—The building is ready for the reception of the new machinery, which has arrived and will be put into position as soon as practicable.

FLORIDA.—During the week the principal work done has been the cleaning out of the main west drift of the 400-ft level, repairing the timbering, etc.

SOUTH COMSTOCK.—Sinking the shaft is discontinued, it being now 295 ft deep, with a good sump completed 20 ft in depth below the 275-ft level. This level is now being opened, and has already cross-cut into the ledge a distance of 25 ft, westward from the shaft.

LEO.—Sinking the winze progresses well, and it is down 195 ft below the main tunnel level to-day. The ground continues favorable for working.

EUROPA.—New shaft down 150 ft to-day, and sinking much facilitated by the rock at the bottom working very favorably. This shaft will intersect the ledge at the depth of 600 ft, but at 400 ft the first level will be opened for the development of the ledge at that depth, which will be 350 ft below the old workings.

SOUTH CALIFORNIA.—Owing to the strong pitch of the ledge to the eastward, it has been decided expedient to suspend sinking the shaft deeper at present, it being now 120 ft in depth, and sink a new shaft about 1500 ft to the eastward.

PHIL. SHERIDAN.—Owing to the favorable nature of the ground, the drift west is progressing faster than heretofore.

ORIGINAL GOLD HILL.—The fine ore body being developed by the cross-cut from the south drift shows even more extensively than was anticipated.

LADY BRYAN—Main south drift at the 380-ft level progressing well, following the east wall of the ledge. Main shaft sinking at the usual good rate of progress, with a slight increase of water.

SILVER HILL.—The shaft is 425 ft deep, and rock at the bottom working favorably; about two feet per day is made in sinking at present.

COSMOPOLITAN.—The stopes above the main tunnel, as well as the face of the main tunnel itself, are yielding a goodly amount of fine paying ore.

HALE & NORCROSS.—Opening the station for the 2200 or lowest level progresses well, and the north winze from the level above having reached its intersection with the lower level, drifting is commenced to connect it with the incline for air circulation.

AMAZON.—Shaft 118 ft deep to-day, with the bottom in favorable working rock, blasting well. The winze, being sunk below the first station level, is 38 ft deep and all in ore. The machinery works well and gives excellent satisfaction.

BUCKEYE.—The new machinery is fast being got into working position. It is of a very substantial description, and will be capable of sinking at least 1000 ft.

GOULD & CURRY.—Repairing and retimbering the recently caved portion of the shaft is about completed.

LEVIATHAN.—Shaft down 404 ft to-day. Seams of clay and quartz at the bottom. Favorable sinking ground. Will commence drifting in a few days.

SIERRA NEVADA.—Drifting both north and south at the 700-ft level, of the old shaft, progresses finely with good prospects.

BROOKS.—Shaft 98 ft deep, with the bottom all in ore which assays well and promises more.

JULIA.—Main southeast drift in 1095 ft. Main shaft 1420 ft deep to-day. Bottom still in hard rock.

DANEY.—Excellent progress has been made in getting the new machinery into working position, and it will be ready to start up next week.

NEVADA.—Some very fine streaks of ore have been passed through this week by the cross-cut.

WOODVILLE CONSOLIDATED.—Excellent work is being done opening out the station or chamber for the head of the incline.

NEW YORK CONSOLIDATED.—Excellent progress is made with the mason work of the foundations for the new and powerful machinery about to be erected.

GLOBE CONSOLIDATED.—The heavy flow of water from the 400-ft level still continues, and prospecting goes forward at the 250-ft level energetically as usual.

UNION CONSOLIDATED.—Work will be resumed in this mine when the repairs to the Ophir shaft are completed.

JACOB LITTLE CONSOLIDATED.—After passing through a horse of country rock, the face of the main west drift is in better ore than ever.

MEXICAN.—This mine being worked through the Ophir shaft.

Oregon.

MINING AT GRANITE CREEK.—*Bedrock Democrat* July 28: The discovery shaft on the Morning Glory ledge is down, we believe, about forty-four ft, and the owners of the mine have contracted with parties to sink sixty-eight ft deeper within ninety days. The vein is 45 inches in width, and all contains mineral—gold and silver bearing. The formation is very similar to that of the far-famed Comstock of Nevada, carrying black sulphurets and stephanite. The news from Granite Creek district is cheering. The Phil Sheridan, a very rich gold and silver-bearing ledge, has been re-located, and work will be commenced on it immediately. Worcester is doing work on his ledge, and running an arrasta on good gold rock. Thomas McDonald is now over there and expresses a very favorable opinion in relation to the Morning Glory mine, and is favorably impressed with the whole country as being rich in minerals.

THE VIRTUE MINE. — The new machinery is now on the road from Umatilla to the Virtue mine. It consists of two boilers, one large engine for hoisting, and two Burleigh drills. The ground to receive the machinery is being prepared as fast as possible. One of the Burleigh drills will be used for sinking the new shaft, which will be started 450 ft east of the ledge, and will intersect the ledge at a depth of 1500 ft. The Burleigh drills will be propelled by compressed air, for which purpose a 40-horse power air compresser has been purchased and is now on the road. It is estimated that the new shaft can be sunk 100 ft per month with the Burleigh drills. The mill is constantly running on good ore. There are about 100 workmen employed at present, and houses, to accommodate more laborers, are being erected.

THE EASTERN OREGON MINES.—The Portladd *Bulletin* of July 16th says: The quartz and placer mines of Eastern Oregon are yielding more precious metals this year than ever before, as the receipts of silver and gold will testify. By far the greater portion of the product goes direct to the mint, the balance remaining in this city for assay, upon account of the owners, who are principally Chinamen.

A RICH LEDGE.—Oregon *Sentinel*, July 31: We were shown this week some fine specimens of polybasite silver ore. The ledge was discovered recently by Mr. Kelley in Josephine county. On the top of the ground it is about a foot wide. The ore assays upwards of $2,500 per ton, being nearly pure silver mixed with a little gold which makes it worth more per ton. They are making arrangements to sink a shaft on the vein. Also some good specimens of gold from the old "Enterprise" ledge, now called "Goldback" near Browntown, in the same county. This ledge was discovered in 1861 by Messrs. Hilyer & Co., but they after spending considerable money sinking shafts, finally abandoned the ledge and left the country during the Idaho excitement in 1862. The vein is now owned by the Oregon quartz mill and mining company. Mr. Kelley thinks he will make it pay $50 per ton with the new inventions and the advance in scientific improvements of the age. This company is building a 5 stamp mill which is nearly completed. They have taken out about 200 tons of rock and will be crushing it soon.

Washington Territory.

RUMORED RICH STRIKES.—Walla Walla *Union*, July 24: It is reported that a rich ledge of gold and silver bearing quartz has recently been discovered on the Swauk; also that a lode of excellent cinnibar has been discovered some ten miles distant from that stream. Crowds of miners are rushing in, and great excitement prevails over there.

British Columbia.

FROM THE CASSIAR DISTRICT.—*Colonist*, July 20: The news from the diggings is not exciting. There had been another freshet, which had delayed mining, but the creeks were falling at latest dates, which are to July 7th. Three or four companies were making from $20 to $50 a day, but the bulk of the companies had not commenced washing. The Chinese had brought the Grant claim for $2,000. Provisions were cheap at Dease creek. In a claim on McDame creek as high as $50 a day to the hand was made. On Trout creek nuggets weighing 8¼ oz. had been picked up. Mr. LeClair, one of the miners referred to, reports that three men, working 13 days on the Thibert's claim on Thibert creek, took out $2,000.

Professions and trades of every kind are well represented. There are three doctors, two lawyers, seven or eight wholesale and retail dealers, two tinsmiths, one bootmaker, two barbers, one dozen or so whisky mills, one Chinese shop, two butchers, three bakers, three restaurants; in fact, everything except a preacher.

Provisions are getting to be cheaper gradually. Flour and beans are now sold at 25c per pound; bacon, 40 to 50 cents; potatoes, 25 to 30 cents; sugar, 40 to 45 cents; but supplies are coming in very slowly, the trail being in an almost impassable condition, so that pack animals can travel on it with light loads only.

General News Items.

THE sensation of the week in San Francisco was the discovery of the defalcation of Kuchel, aged 20, a clerk of C. W. Fox, the stock broker. $60,000 will probably cover Mr. Fox's loss by his enterprising young clerk.

COL. BAKER, of the British army, and a crony of H. R. H., Prince of Wales, has been found guilty of an indecent assault upon a young lady, and sentenced to 12 months' imprisonment and £500 fine.

JUDGE MORRIS, counsel for Tilton, has served notices on Shearman and Sterling, attorneys of record for Henry Ward Beecher, to be prepared to answer in a new trial on the first Monday in September.

IN the Nortou murder case, now on trial at Santa Barbara, Jack Cotton has been found guilty and sentenced to imprisonment for life. The trial of Mrs. Norton is now progressing.

THE sale, under order of the United States Court, of the franchise and property of the Northern Pacific railroad company, has been postponed from the 2d until August 12th.

A young man named Julius Enfurt, bookkeeper in the firm of Smith & Co., Santa Barbara, committed suicide on Saturday morning at Montecito.

EX-PRESIDENT Andrew Johnson died at the residence of his daughter, in Chattanooga, Tenn., on Saturday morning last.

THE Sultan of Turkey, it is rumored, has dismissed his Grand Vizier. We believe Turkey has no tenure-of-office law.

A MAN named Lauren Storey, of Lagrange, Stanislaus county, was drowned while bathing in the Tuolumne river on Tuesday.

THE Oroville and Laporte stage was robbed near Forbestown, on Tuesday last, of Wells-Fargo's box containing $2,300 in treasure.

THE measles are still ravaging the Fiji islands; 40,000 natives have already fallen victims to the scourge.

MOODY and Sankey held their closing service in Liverpool, on the 3d inst., before an audience of 10,000 people.

THE corner stone of the Kern county court house was laid at Bakerfield, on the 2d inst.

THE number of deaths from yellow fever at Fort Barrancas has been 25 out of 72 cases.

Progress at the Sutro Tunnel.

The following is the report of progress in the Sutro tunnel, for week ending July 29, 1875:

Number of feet in tunnel, July 22	10,134
Number of feet driven during week	162
Distance in, July 22	10,296

Details of work performed are as follows, heading being 8x10 feet:

Holes drilled	485
Holes blasted	511
Aggregate depth	3415 feet
Average depth	7.04 feet
Powder consumed	1,346 lbs
Exploders consumed	498
Rock extra ted	2,098 tons

Rock—Porphyry filled with iron pyrites.

[Signed] A. SUTRO, Gen. Supt.

THE Southern Pacific railroad is now in operation as far as Colton, San Bernardino county.

PEOPLE along the proposed line are agitating the building of the Chico and Colusa railroad.

A NEW line of clipper ships has been established between Philadelphia and San Francisco.

English Mint Records.

An examination which has been made of the records at the mint shows many books and papers worthy of preservation. A "Booke for the Dies, of Gold, Silver, etc., 1676, 1677," contains an accounnt of "Dies for the heuling piece with the Angell," and "Dies for the healing piece with the Shipp," which evidently have reference to the practice of touching for the "king's evil." There is a series of account books relating to the great coinage executed between the years 1695 and 1700. The new money required being far in excess of what the mint at the tower was capable of coining conveniently, mints were established at Bristol, Chester, Exeter, Norwich and York. Old money and plate were received at a certain rate, and coin was delivered out in the same manner as in London. There is a volume containing correspondence between the principal officers of the mint in London and their deputies at Chester. Suspected malpractices at Chester in 1697, "whereby," writes Mr. (afterwards Sir Isaac) Newton, then warden of the mint, "the money comes out worse than heretofore," were followed by protracted disputes between the officers at Chester. A remonstrance, addressed to Mr. Clarke, the deputy master, by his two colleagues, charging him with having treated them with contempt and scorn, drew a reply from Mr. Clarke, in which he says: "I never treated either of you with contempt and scorne, not even when one of you did spit in my face in the publique office." Newton and his colleague, Mr. Neale, then master of the mint, wrote that they were resolved to come and hear both sides themselves, adding, "Till we come, let there be no further quarrelling, but let the publick business be peaceably carried on as it ought to be; for the mint will not allow of the drawing of swords and assaulting any, nor ought such language wee hear has been he used any more amongst you." The plant of the Chester mint was shipped to London in 1698, the work for which it was erected having been brought to an end. Another book contains accounts of the recoinage of a large quantity of the old "hammered" gold coin of the reigns of James I, Charles I and Charles II, which had, down to 1733, been current under the name of "hroad pieces." These coins were received under proclamation at the mint at the very high rate of £4 1s per ounce. In 1733 and 1734 this rudely fashioned "hammered" money was in this way withdrawn from circulation. A book of entries of all the "Assaies and Verdicts of the Pixe," taken before the Lords of the Council *ab initio regni Regis Jacobi imi et deinceps* is regarded as one of the most valuable of all the original records remaining in the mint. It appears that during the commonwealth new trial plates were prepared, but they were not recognized after the restoration, as in the first year of Charles II an order appears directing new plates to be again prepared, for the reason that "those standard pieces of gold and silver which were made in the reign of King James are wrought out." The plates made under the commonwealth still remain in the mint almost intact. Some of the trials of the pyx recorded were made in the presence of the sovereign. The "Record Books," extending from 1445 to 1849, contain many documents of great interest and importance.—*London Times.*

New Incorporations.

The following companies have filed certificates of incorporation in the County Clerk's Office at San Francisco:

BEAVER M. Co.—July 29.—Location: Elko county, Nev. Capital, $5,000,000. Directors—W. H. Mills, M. J. McDonald, S. Reinhart, G. H. Willard and W. G. Hughes.

BOSTON CINNABAR M. Co.—July 29. Location: Trinity county, Cal. Directors—Edmond Green, R. E. Brewster, Charles R. Worland, C. C. Palmer and Abraham Halsey. Capital stock, $5,000,000.

ALASKA M. Co.—July 30.—Location: Sierra and Yuba counties, Cal. Capital, $1,000,000. Directors—Stephen Spencer, J. P. Brown, J. R. Meek, Charles Lux and W. C. Belcher. The principal place of business will be in Camptonville, Yuba county.

DARWIN CONS. S. M. Co.—July 30.—Location: Inyo county, Cal. Capital, $10,000,000. Directors—Robert Sherwood, W. H. V. Cronise, G. W. Kidd, E. M. Fryaod B. S. Schmidt.

ANGORA ROBE & GLOVE Co.—July 30.—Location: San Jose, Cal. Capital, $50,000. Directors—John W. Hinds, Jackson Lewis, Henry T. Welch, G. V. Brown and Return Roberts. The principal place of business will be in San Jose.

SONOMA VALLEY WINE & BRANDY Co.—August 2. Location: Sonoma county, Cal. Directors—Wm. McPherson Hill, David Burris, Leonard Goss, A. S. Edwards, O. W. Craig, A. F. Harasthy and George L. Wratten. Capital, $250,000. The principal place of business will be in Sonoma valley.

GREAT WESTERN CONS. M. Co.—August 2.—Location: Inyo county, Cal. Capital, $ 0,000,000. Directors—G. W. Beaver, L. S. Adams, R. Wegener, W. W. Stetson and John Turner.

HILLSIDE G. & S. M. Co.—August 2.—Location: Devil's Gate and Chinatown mining districts, Lyon county, Nev. Capital stock, $6,000,000. Directors—James A. Pritchard, J. Ross Browne, A. S. Peterson, S. J. Corbett and J. P. Jackson.

TASSAJARA COAL M. Co.—August 2.—Location: Contra Costa county, Cal. Capital stock, $1,000,000. Trustees—C. M. Dougherty, L. Atkinson, H. Johnston, F. Saogmaster and George Johnston.

NORTH SAVAGE G. & S. M. Co.—August 4.—Location: Nevada. Trustees—Thomas Ryan, T. P. Riordan, L. J. Mooney, Wm. M. Pierson and Wm. T. Higgins. Capital, $10,000,000.

VULCAN M. Co.—August 4.—Location: Nev. Trustees—O. W. Phillips, Peter Mathews, Wm. Hazelhurst, Wm. E. Hale and Samuel Miller. Capital, $6,000,000.

BUFFALO M. Co.—August 4.—Location: Cal. Trustees—L. C. Fowler, Daniel Cook, Frank Swift, W. H. Porter and E. W. Haskins. Capital, $10,000,000.

CANON CONS. M. Co.—August 4.—Location: Cal. Trustees—Frederick Clay, George R. McKenzie, Joseph C. Ford, James W. Goliy and Henry Raymond. Capital, $10,000,000.

CENTENNIAL G. & S. M. Co.—August 4.—Location: Nevada. Trustees—C. Allenberg, George T. Bromley, Thomas Cole, Paul Moroney, Chas. E. DeLong and J. F. Freeman. Capital, $10,000,000.

Popular Lectures.

Economy of the Vegetable and Animal Kingdoms.

Seventeenth Lecture delivered before the University of California College of Agriculture, on Monday, February 15th, 1875, by Prof. C. E. Bessey.

(Reported and Illustrated for the Rural Press.)

Hybrid and Spontaneous Varieties—On the Limits of Crossing.

It is a question of much importance to the breeder, whether of plants or animals, how far crossing can be successfully carried, or in other words, what forms admit of crossing. Upon this question diverse opinions prevail, and indeed it is most difficult to obtain reliable data. This state of things is, no doubt, due to the fact that most observers have started out with certain erroneous ideas, which prejudiced them in their investigations.

Generally the discussion of the question is introduced by making a distinction between a cross and a hybrid, that is, it is generally stated that when two individuals of the same species unite, the result is a cross, while if the individuals are of different species, the result is a hybrid. Then, to make the matter worse, we have the law laid down that whenever two different forms produce sterile offspring, such forms belong to or constitute different species, while, if they are fertile, they belong to the same species. Should we accept this statement it would be easy to frame an answer to the question as to the limits of crossing; but then as you see, it would be equivalent only to saying that crossing is possible as far as it *is* possible. Such a statement conveys no meaning, and we might as well leave it out of our discussion. If systematic botanists and zoologists wish to adopt fertile crossing as the test for species, we certainly will not prevent their doing so. Our question still remains. Let us see whether we cannot clear away some of the rubbish.

I lay down the following propositions:

I. There is no essential difference between what is called a cross and what is termed a hybrid. The idea of there being an essential difference between a cross and a hybrid has come down to us from the times when the relations between variety and species were not as carefully studied (I will not say *understood*) as now, when naturalists considered species invariable, and when the possibility that a variety might become a true species never was in the thoughts of the student of plants and animals, it was a most natural supposition that the union of two varieties of the same species was a very different matter from the union of two species. To-day, however, we cannot admit of there being any difference.

II. The forms which are alike are, other things being equal, the most successfully mated, for unlikeness implies differences in organization, or function, or both, which must be disadvantageous; and the greater the unlikeness the less the possibility of successful mating. That this is the case in nature is pretty clearly indicated by observations and experiments, which, unfortunately for us, are far too few in number. Some more evident reasons for this last proposition are the following:

1. The varieties may come into bloom at slightly different times and so render crossing difficult. Example—Early and late varieties of cultivated plants.

2. The varieties may become different in size, and so fertilization may become a physical impossibility. Example—Some bantam fowls.

3. They may live in different localities; one may live or grow on the mountains, the other in the plains. Example—Alpine varieties.

4. They may become *exclusive* in habits; in plants, occupying the ground to the exclusion of others; in animals, gathering in herds or flocks by themselves. Example—Pigeons and some grasses.

5. In flowers dependent on insects for fertilization a very slight difference in arrangement or proportion of the parts would prevent cross-fertilization. Example—In the orchids.

6. It is probable that in forms which differ from one another, the reproductive cells are not the exact complements of each other. All these facts point to one result—and that is that as forms diverge from one another they become less and less fertile.

Now, as we well know that the difference between species is not a uniform quantity, we are prepared to expect unequal degrees of fertility. That this occurs, you well know. Some allied species are absolutely barren while in other cases hybrids are readily obtained. In some genera the species seem to be very closely allied and in such cases there is a little difficulty in crossing, as is the case with the species of the horse genus, with the dogs and wolves, and in plants with the members of the grape genus, also the oaks. In other words, the distance so to speak, between the species is so great that crossing cannot occur.

We must cease to expect the limits of crossing to be a fixed line which can be described in taken from our nomenclature. The older investigators attempted to find some definite limit, and hence we find them suggesting that probably no crossing could take place between species belonging to different genera. They expected to discover some simple, short rule which should enable them to express the whole matter in few words. Here again, as elsewhere, ignorance expected what can never be realized.

Nature Draws No Sharp Lines of Separation.

Her methods cannot be expressed in the short "rules" demanded by those who do not understand her ways. Thus far we can say of the limits of crossing, that "the more nearly allied two forms are, the more readily will they cross." If you ask, "how much difference is required to prevent crossing?" I answer that must depend upon the kind of difference. Referring to the list of reasons for infertility of varieties (or species) you will see that a very little difference in the time of blooming would prevent the crossing of some species of plants, while for others a longer time might be allowed. Difference in size is more or less important according to circumstances. In plants, the staminate plant may increase very considerably in size over the pistillate one without decreasing materially its power to fertilize it, but no great increase in the opposite way is permissible. In the majority of animals the same rule seems to hold, while in some groups it is reversed, as in the raptorial birds; in some cases size of body alone; in others, size of reproductive parts, *i. e.*, large or small flowers, large or small pollen. I need not run over all

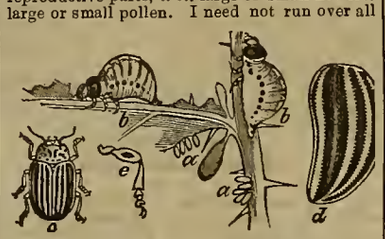

Fig. 1 The Bogus Potato Beetle.

the differences before pointed out. You can readily see the need there is of a careful examination of the whole subject and the need there is of a thorough study of each particular species.

The Sterility of Hybrids.

If we cross a succession of forms which gradually diverge, we find that before the point of absolute sterility is reached, there is a point where hybrids are produced which are imperfect, hence they are sterile, and cannot reproduce their hybrid kind. This is exactly what we should expect from what I have said before. The mule and the hinny are familiar examples. Domestication frequently reduces this tendency to sterility of crosses.

[To be Continued.]

Insect Enemies.

Prominent among the insect pests which are raising havoc in some of our agricultural sections is the *Doryphora junota*, which has been named

The Bogus Potato Beetle,

From its close resemblance to the Colorado beetle; but if the reader will compare the sub-

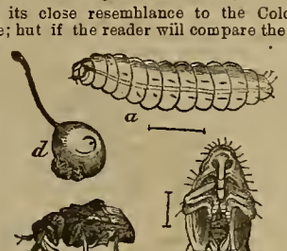

Fig. 3. The Curculio.

ject of the accompanying illustration—Fig. 1—he will observe some striking differences in markings. The eggs, *a a*, are very nearly like those of the regular potato beetle. The larvæ, *b b*, are lighter colored, and have light colored heads instead of black ones. The mature insects are also lighter colored, and in them the *second and third* black lines counting from the side of the body, are united posteriorly; this is shown at *d*, which represents one of the wing-covers. The leg, *e*, is seen also to differ from that of the other species, in the black spot on the thigh. This species does not feed upon the potato; its chief interest lies in its close resemblance to the potato beetle.

Fig. 2 in our illustration is the

Sheep Bot-Fly.

It is also known as the "Head Maggot" and "Grub in the head." The accompanying cut shows the different stages of its growth. 1 and 2, the fly; 3, pupa; 4 and 5, full grown grubs; 6, a young grub. All are somewhat enlarged.

The fly is described as being somewhat larger than a common house fly; of a dull yellow color above, marked with brown; eyes purplish-brown; under side of head puffed out and white; feet brown; wings transparent and extending beyond the body. It is viviparous; that is, instead of laying eggs, as most insects do, it retains them in its body till they hatch, when they are laid as minute grubs.

In early summer the flies—Fig. 1 and 2—appear and begin laying their young in the nostrils of the sheep. These grubs, or maggots, are quite lively, and soon wriggle their way upward through the nasal passages into what is known as the *frontal sinus*. If the egg were deposited here there would be more likelihood of its being discharged or blown out by the sheep; but the active maggot obtains a living hold, commences at once to work upward into the head of the animal, and ejectment is not likely to occur.

When the fly deposits larvæ in the nostrils they crawl back through the nasal cavities, and through these canals into the sinuses, where they live until the following spring, by which time they have attained their full size. During this time the grubs feed upon the mucous matter in the sinuses, and thus cause irritation of the membrane which lines them. It is declared by some that the grubs eat their way into the brain; but it is now generally conceded that the injury arises from the communication of the irritation of sinuses to the other membranes of the head.

The grubs, when full grown, crawl down the canals and through the nostrils, falling to the ground, in which they bury themselves. Here they undergo their final transformation, changing first to the pupa state, Fig. 3, and in early summer emerge as the perfect winged fly, Figs. 1 and 2.

Various modes of treatment are practiced for sheep affected with the sheep hot-fly. Tar is a very common remedy, and is used by daubing the nose of the sheep during the time of the deposition of the young grubs. Or the sheep will tar their own noses if it is placed in the troughs or places where they go after salt. If the sheep can get at dry dirt or dust, at the time when the flies are depositing their eggs, they will thrust their noses into it and thus, in a measure, frustrate the designs of the insect. Other simple remedies are used with partial success, but some modes of treatment are applied which are about as hard on the sheep as on the parasites.

We have reserved for the last of this week's group an insect whose name has more terrors for the fruit grower than that of any other pest.

The Curculio.

Millions of dollars would not square the account charged against this little insect by the

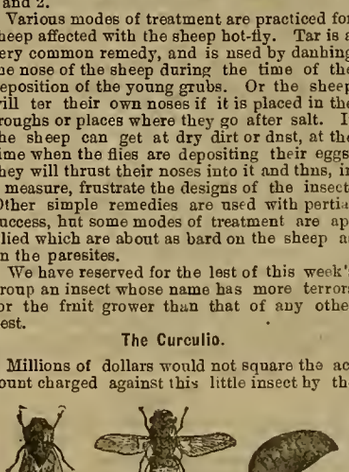

Fig. 2. The Sheep Bot-Fly.

fruit growers of the Atlantic States. Its destructive and persistent attack upon the plum seems like a war of extermination; and for a term of several years the apprehension was quite common that this fruit would have to succumb. Even now the curculio's assessments on the plum orchards are enormous; but the legitimate owners are less disposed than formerly to be "froze out." The cherry and the peach have also suffered severely from the ravages of the curculio. The damage to the latter has been less than to the former; and the area of its cultivation being restricted in the Eastern States, the loss was less generally felt; but cherries were formerly nearly as standard a fruit as apples, and were as little restricted to localities; but now they are considered among the fruit delicacies. With this result the curculio is chargeable.

Fig. 3 in our illustration shows this insect in its four stages—*a*, the larva or worm; *b*, the pupa; *c*, the beetle about half grown; *d*, at the right, the beetle, natural size; *d*, at the left, the plum with the crescent shaped sting of the insect.

The mature insect is about one-fifth of an inch long; rough, and of a dark brown color. It belongs to the family of "Snout beetles;" characterized by the anterior part of the head being prolonged into a proboscis or snout. Like the cucumber bug and some other insects it "plays possum," or feigns death when disturbed, folding its legs and dropping from the tree.

The eggs are white, oval and barely large enough to be seen with the naked eye. In laying them the beetle first makes an incision with its snout in the young fruit, as seen on the plum, *d*, and then deposits in it a single egg, which soon hatches into the grub, *a*. This is at first very small, but grows rapidly while feeding upon the flesh of the fruit; and when full grown measures about three-eighths of an inch, being of a whitish color. When the grubs are full grown—which may happen at different stages of the growth of the plum or peach—the fruit falls from the tree and the insect goes into the ground. As the cherry occupies less time in maturing than the plum or peach, the grub does not attain its full size in this fruit until it is about ripe; and, therefore, it does not fall from the tree as early as the others.

The grub soon leaves the fallen fruit and hides itself in the ground, where it is transformed to the pupa, as seen at *b*, and remains in this state about three weeks, when it is again transformed to the mature or beetle state. In this State it remains in the ground until spring comes, when they commence their life task of destroying the season's plums, peaches and cherries.

Different modes of warfare, some of them laborious and expensive, have been practiced against the curculio, with scarcely perceptible results. We had the honor of serving in the campaign against this destroyer when it first invaded New York, about thirty years ago, and have met him on many succeeding occasions, employing all sorts of tactics, but have never pretended to be a match for this, the second great destroyer that has spread ruin and devastation under the banner of the crescent. The most efficacious mode, in our opinion, is to gather the infested fruit as soon after falling as possible, and feed it to hogs, or destroy it by burning.

The Woodside Mine.—Cor. El Dorado Co. *Republican*, July 22: I notice in your last week's paper that you say the Woodside mining company of this place was still sinking. This is incorrect. I have taken the trouble to examine this mine within the last few days, and can give you a true statement of its operations during the last year. About one year since the company erected buildings and put up a 40-horse power engine, together with suitable hoisting works, and steam pump to clear the shaft of water. At this time the shaft was 130 ft deep, and after pumping about 6 weeks cleared the mine of water and began sinking, but soon found the water so strong that they put in another steam pump, (Knowles' patent) 14-inch cylinder, capable of throwing 35 miner's inches of water. The shaft was continued down to a depth of 264 ft. During the time small drifts were run to cut the ledge, which seemed to dip to the east. At 254 ft, the first regular working level is now being run, rather more in the shape of a cross-cut, which will tap the ledge some 80 ft east from the shaft. This cross-cut is now in about 70 feet, with a fair prospect of finding a good ledge. During the time this work has been going on, a 5 stamp mill has been erected, with the wood and iron work so arranged that five more stamps can be set up at any time. During the last six months, considerable money has been taken out of the mine, but the company have turned their attention more to opening and developing the mine than to taking out money. The formation is now very regular, and soon large sums of money will be taken out, as of yore. The mine is mostly owned in San Francisco, and a large number of shares are owned by our citizens, who have great faith in the future of the mine, and their beautiful mountain town.

Illustrating Our Ethnology.—The Smithsonian Institute of the United States proposes to secure as complete a collection as possible to illustrate the Ethnology of the United States to be exhibited at the Centennial Exhibition in Philadelphia next year, and solicits contributions for this purpose. The object of the collection is to exhibit as complete a series as possible of everything tending to illustrate the past and present history of the aboriginal races now or previously inhabiting the continent of North America, thus including both what is strictly pre-historic in its character or relating to a long past age, and what belongs to the present day.

Ruby Hill.—The town of Ruby Hill is really the busiest looking little place in all Eastern Nevada. Passing through it yesterday for the first time in several weeks, we were most favorably impressed with the spirit of improvement and business activity on all sides observable. A large number of new dwellings have been erected lately and families are arriving and settling there in great numbers. Ruby Hill will yet be an important point. As things are, it is a lively little business place, and it would be still better if it was only a few miles further from Eureka. We of the county seat, however, would prefer having it just where it is.—*Eureka Sentinel.*

Coal Fields of Spain.—M. Grand in describing the coal fields of Spain to the Paris Society of Engineers, estimated their area at 150,000 hectares (the hectare being about 1.47 acres) from which only 500,000 or 600 000 tons are annually extracted, while Belgium, with the same area, yields 10,000,000 tons. The Spanish coal fields are situated in Castille, Leon, and the Asturias. The processes are described as very rough and imperfect. M. Delesse stated that the coal of the Asturias was chiefly used for gas making.

An Opinion.—Prof. Frank Stewert gives it as his opinion that the mines of Ruby Hill, when sufficient depth is attained, will produce free milling ores instead of base metal ores as now. This may be true, but we hardly think the change need be expected this year or next. It is a fact though, we believe, that the ores in some portions of the hills are gradually growing more "quartzy," so to speak, and richer in gold as a greater depth is reached. That the Ruby Hill mines, however will last for ages, one form or another, does not admit of a doubt. —*Eureka Sentinel.*

A Governor in Limbo.—The Governor of Kentucky was marched into the police court at Frankfort, a few days ago, and fined $1. The offense was that he had played croquet on the State House grounds.

Useful Information.

Protection Against Flies.

If any information or suggestion can be given which will tend to reduce the discomfort arising from the prevalence of house flies, that information or suggestion will benefit at least one-half the people of this country, particularly at this season of the year, when the pests are being armed and equipped for the summer campaign. On this subject there are a few things worth publishing and knowing. One is that the eggs of flies are never laid or hatched in the house, and scarcely ever in the shade. There are a few favorite localities where the eggs are deposited, which can be easily discovered. One is upon the lower side and along the main rib of the leaves of certain kinds of trees and shrubs. If the leaves curl, and upon examination a mass of minute insects are found, of color from dusky brown to black, and flies small to full grown are about the tree, one may know that that tree or shrub is the hatching place for flies. A small tree is sufficient to produce millions of them. I have at different times been compelled to dig up a beautiful purple-leaved beeberry and an English cherry of the yellow Spanish variety for the reason that they were breeding ground for flies, and in too close proximity to my house, which they were yearly filling with this filthy insect. Another favorite place for depositing their eggs is where the flow from a sink is allowed to stand and grow putrid on the surface of the ground. Where favorite food is furnished them and light is freely admitted they will be attracted a long way, but in dining rooms and kitchens all sweet and moist food should be secured as soon as the table is left by the family and the light excluded. If these few suggestions are heeded the annoyance of flies and the consequent reputation of a slovenly house can be easily avoided to a great extent. This will pay good interest, first in a reputation for cleanliness, and secondly in being relieved of a nuisance which is often past human endurance.

Utilizing Silk Rags.—It is stated, in *Les Mondes*, that one of the wealthiest English velvet manufacturers, Mr. Listar, worked his way to success by years of patient labor in search of a way to utilize silk rags. He began by buying up all such waste at less than a cent a pound, and up to the year 1864 he had expended the immense sum of over $1,300,000 in fruitless efforts to find a process. Nothing daunted, however, he continued his experiments, and within the past ten years has discovered a method of converting such refuse into velvet of the finest quality. He now carries on this industry in England, in an establishment which employs some 4,000 workmen, and hundreds of travellers are also employed whose sole business is to buy the silk waste, and this they do in all parts of the globe. The factory is said to have cost nearly $3,000,000.

Cement for Fastening Marble.—1. Melt four ounces of bleached rosin with a half ounce of white wax, and stir into the melted mass one ounce of plaster of paris. To use, clean the surfaces to be joined, heat them sufficiently to melt the cement, and after applying it, press the parts well together so as to have only a thin layer of the cementing material at the joint. 2. Add half a pint of vinegar to an equal quantity of skim milk, and mix the separated curd with the whites of five eggs, well beaten, enough quicklime being sifted in to form a stiff paste. This cement is more suitable for small articles of marble, or stonework in general.—*Druggists' Circular.*

Improved Starch.—A beautiful finish can be given to articles to be starched by taking one-fourth of a pound of starch, and working it over and kneading it with a little water, then placing five or six pints of water in a pan, and adding to this a very small quantity of powdered borax, a small piece of sugar, and a fragment of white wax about the size of a hazel nut, and heating the whole sufficiently. This water is then to be added to the starch, with continual stirring, mixing the two together until the whole is as thick as is convenient for application. If the articles are to be made quite stiff, the strength of the starch may be increased two or three fold.

How to Test a Safety Valve.—When you have no steam in the boiler, secure the valve stem to the lever, and attach a spring balance to the lever just over the center of the valve stem. Then raise the lever slightly, so as to get the valve clear of the seat, and note the reading of the spring balance. Then divide this reading by the area of the valve in square inches, and the quotient will be the pressure in pounds per square inch at which the valve opens. The attention of all who wish to test their safety valves is invited to this extremely simple and accurate method.—*Scientific American.*

If mosquitoes or bloodsuckers infest our sleeping rooms at night, we uncork a bottle of the oil of pennyroyal, and these insects leave in great haste, nor will they return while the air in the room is loaded with the fumes of that aromatic herb. If rats enter the cellar, a little powdered potash thrown into their holes or mixed with meal and scattered in their run ways never fails to drive them away. Cayenne pepper will keep the buttery in store rooms free from ants and cockroaches.

A Singular Specimen.—The Erie (Penn.) *Dispatch* says that when Dr. Germer, of that city, was in the great West a few months ago he was presented at Cannon Ball river, Dakota, with a ball about three inches in diameter, covered with dust, and having the appearance of being partially fused on a portion of the surface. He threw it into a box of relics, and thought no more of the matter until a week or two ago, when he was overhauling the pile and discovered the ball. Taking it to a machine shop he thought he would smooth up the ragged edges a little; but upon putting it upon a grindstone he discovered that the ball was not iron, but a material harder than hardened steel, and that the stone had little effect upon it, and that it would scratch glass readily. He has come to the conclusion that it is an aerolite or meteoric stone, nearly round, and resembling a cannon ball, with the exception that it is heavier than iron.

Cleaning Tubes in Tubular Boilers.—R. Weinlig, of Magdeburg, recommends the following apparatus for sweeping the tubes in locomotive and other tubular boilers. A copper tube, about one-fifth of an inch in diameter, and contracted a little at one end, is provided with a wooden handle, and also with a hole where steam may be introduced through a rubber tube. The handle should be a yard long or more, the copper pipe long enough to reach through the fire box or smoke chest and project a short distance into the tubes to be cleaned. The firemen takes the wooden handle under his arm, inserts a pipe into a tube, admits the steam by means of a suitable stopcock attached for that purpose, and rotates the tube round the side of the tube. The escaping steam cleans the tube in a short time, and in a very convenient manner, without disturbing the working of the boiler, or exposing the fireman to heat, smoke or dirt.

Driving Tacks.—A correspondent of the *Building News* writes to that journal as follows: "I had to put a number of small tacks into a piece of work I was engaged upon, and the positions into which they were to be driven were so awkwardly situated that I found the greatest difficulty in getting them into their proper places. After many unsuccessful trials I hit upon the following plan, which answered perfectly. I magnetised a common brad punch, and then by simply placing tacks one after another on the end of the little bar magnet thus formed, I found I could insinuate them into their places with a facility and grace which I could not even dream of when trying any other plan. This dodge may not be new, but it saved me a lot of time, and may in a like manner prove useful to some other of your readers."

Varnishes to Protect Iron from Rust.—Sterling prepares a varnish for this purpose by dissolving gum copal in paraffine oil, placing the iron in it and heating it under increased pressure. Iron vessels, tinned inside, which can be hermetically sealed, are heated by superheated steam. Scott uses the following mixture:

Coal tar	6 gallons.
Black varnish	3 "
Wood tar oil	2 "
Japanese glue	1 "
Red lead	28 lbs.
Portland cement	14 "
Arsenic	14 "

Good Health.

Injurious Effects of Oil-Cloths.

In comparing the deadly effects of animal and vegetable substances in a state of decomposition, it is claimed that a decaying potato is equal to a decaying ox. Perhaps, in view of the fact that the aroma arising from a dead ox would absolutely force itself upon the attention of a community and demand abatement of the nuisance, while the more delicate gas of the defunct potato would admit of inattention or delay on the part of its threatened victims, the potato might be considered the most dangerous of the two. But a still more insidious enemy to health, which most people fail to recognize at all, is dead water. Confined moisture in contact with wood, at a temperature between forty-five and seventy deg. Fah., which is the ordinary temperature of houses in this climate, slowly decomposes and produces a gas which is one of the most fertile causes of the whole class of typhoid and malarial fevers. It is a cause which acts so silently that it is left, unnoticed and unsuspected, to do its work.

One of the most common haunts of this imperceptible gas is in wood covered by impervious material, such as oil-cloth. Water-proof floor-cloths are among the first of the household comforts the tidy housewife desires. They go down in all haste, and the consequences are not apparent till the discovery is made that they are becoming rotten. Water has penetrated through nail holes or cracks underneath them, and, being prevented from evaporating, is absorbed into the wooden floor and gradually decomposes, with the result which has been stated.

Of course it is not necessary that this effect should attend the use of painted floor cloths. Sanitarily considered they are admirable from their quality of refusing to harbor dust or contagion, and being good conductors of heat, they are capital for summer; but when painted floor-clothe and those impervious to moisture are used, there should be the greatest care taken to let no water get into the wood underneath. —*Ex.*

Eating.

As so much of man's happiness and usefulness in life depends upon eating correctly, and as the housekeeper has so much control over this part of our living, we have thought that a few suggestions on the science and art of eating might not be inappropriate to this department.

Every emotion of the heart, every operation of the mind, every motion of the body, or of any organ or member thereof, consumes power which must be supplied by the food we eat; and while it is of the utmost importance that our food shall be wholesome, nutritious and digestible, it is of scarcely less importance that it be eaten correctly, at the right time and with our systems in the right condition.

As first in order we would say, never eat when the body is exhausted. Under judicious management, farmers and farmers' wives need never have dyspepsia, for their plain, fresh diet and free exercise should prevent that terrible disease; but statistics we think prove that they are no more exempt from it than other classes. That they are not, we think, is attributable to the fact that they too often eat when they ought to rest; when their powers are too much exhausted to perform the functions of digestion.

The housewife does her own work, or at least assists about it, works hard to hurry up dinner and have it ready promptly on time, calls the men before dinner is ready, hurrying to the last moment, and then, when she ought to lie down and rest, she sits down to the table and eats. She is so much exhausted that hunger has ceased, her organs of taste are inactive, her salivary glands do not perfectly perform their functions, she does not masticate well, and the food enters a stomach not prepared to perform the work of digestion.

The farmer hurries from the field and his severe labor, and while yet weary and exhausted, sits down and swallows his food, hurrying back to his labor. Is it surprising that, after a few years, the digestive organs become impaired and so many farmers and farmers' wives have wrecked their health before arriving at middle age.—*Rural Home.*

What is Perfect Sleep?

Perfect sleep is always dreamless, while dreaming implies disturbed or an agitated state of brain and mind. This is not rest, or repose, which is "nature's sweet restorer." When retiring with the hope for sound sleep, we should reverently prepare ourselves for it. The following from the *Science of Health*, seems appropriate here, and a fitting conclusion to these curiosities:

"Going to Bed.—We should never go to bed with a hope for rest, sleep and perfect repose until "all ready." The *preliminaries* for retirement are all just as important as are those for the day's duties. We must not go to bed with an overloaded stomach, in an anxious or troubled state of mind, with cold extremities, or without anticipating and respondiug to the calls of nature in all respects. Standing over a register, before a fire, or in a stove-heated room, is not the best way to get warm for a night's sleep. We should take such vigorous exercise as will give quick circulation to the blood, and not depend on artificial, but on natural heat. Attention to all these things, followed by such devotional exercises as will bring all the feelings, emotions and sentiments into accord with the Divine will, subduing passion, removing hatred, malice, jealously, revenge, and opening the portals of heaven to all who seek rest, peace and sweet repose."

It is a happy custom with many to conclude the evening's proceedings by singing a sweet, quiet hymn—"The Day is Past and Gone," etc.—which brings all present into delightful union with each other, and with "Our Father who art in Heaven."—*Ex.*

Don't Worry About Yourself.—To retain or recover health, persons should be relieved from anxiety concerning disease. The mind has power over the body. For a person to think he has a disease, will often produce that disease. This we see effected when the mind is intensely concentrated upon the disease of another. It is found in hospitals that physicians and surgeons who make a specialty of certain diseases are liable to die of them themselves, and the mental power is so great that sometimes people die of the diseases which they only have in imagination. We have seen a person seasick in anticipation of a voyage, before reaching the vessel. We have known people to die of cancer in the stomach, when they had no cancer or other mortal disease. A blindfolded man, slightly pricked in the arm, has fainted and died from believing that he was bleeding to death.

Therefore, well persons, to remain well, should be cheerful and happy; and sick persons should have their attention directed as much as possible from themselves. It is by their faith that men are saved, and it is by their faith that they die. As a man thinketh so is he. If he wills not to die, he can often live in spite of diseases; and if he has little or no attachment to life, he will slip away as easily as a child will fall asleep. Men live by their minds as well as by their bodies. Their bodies have no life of themselves; they are only receptacles of life—tenements for their minds, and the will has much to do in continuing the physical occupancy or giving it up.

Rubbing Warts, night and morning, with a moistened piece of muriate of soda, is said to cause their disappearance without pain or a scar resulting.

Domestic Economy.

A Model Kitchen.

It is a cheerful room, sunny in winter and shaded in summer. It has pictures on the wall, white curtains at the windows, a few blooming house plants at the southern exposure; it has a commodious polished range or cooking stove, a large kitchen table, a pantry, a sink with pump leading into it, and a waste pipe leading from it; a small case of shelves for books, a hanging lamp, a good reg carpet, hooks for hats and coats, shelves for tins, the scales and the dish pan. The pantry has a window in it, shelves on two sides of it, the lower one being broad enough to cover the flour and meal barrels. Here the housewife finds everything required for meals, save such articles as need to be kept in the cellar. There is a spice box in this pantry, a chopper, a sieve, a colander—all the conveniences required in plain cookery, each in its appropriate place.

A shelf behind the stove is a capital place to set bread to rise, or to hold the batter dish when one is trying cakes, or to iron on in cold weather. The table in the corner by the sink may be taken away and the cradle set there when the thermometer is below thirty-two deg. There should be a lounge in the kitchen of every woman who does her own work, that she may drop down on it and rest while waiting for the tea kettle to boil, or the bread to take on a brown crust, or the men to come to dinner. One can rest a great deal faster lying down than setting up.

The foregoing, taken from the Vermont *Farmer*, contains many excellent suggestions, to which, however, the following may be added: The woodhouse should be connected with the kitchen, so that one corner of it could be partitioned off for a bathroom, arranged so that a good supply of tepid water could be obtained from the kitchen by simply turning a faucet. The wood box (and every kitchen should be supplied with one) should project into both the kitchen and the woodhouse. It should project into the kitchen within a couple of feet of the stove to a distance of eighteen inches, and should be about three and a half feet in length, eighteen inches in hight on the front side and twenty-four on the side next the wall. This box should have a close fitting cover, that would exclude the cold in winter; the cover should be fastened to the wall with hinges. The wood box, which has no cover in the shed, is left open so that as fast as the wood is split it can be tossed directly into the box. This is a good plan for saving steps, which will be duly appreciated by many good housekeepers.

Injurious Management of Dishes.—A good set of dishes will last for ages, if properly handled. We have heard of an excellent housekeeper whose bridal dishes, thirty years old, are in excellent condition to-day, although they have been in use every week, more or less, during all the time alluded to. In a common dinner service it is a great evil to make the plates too hot, as it invariably cracks the glaze on the surface, if not the plate itself. We all know the result. It comes apart. Nobody broke it. "It was cracked before" or "cracked a long time ago." The fact is that when the glaze is injured, every time the "things" are washed the water gets to the interior, swells the porous clay, and makes the whole fabric rotten. In this condition they will also absorb grease, and when exposed to further heat the grease makes the dishes brown and discolored. If an old, ill-used dish be made very hot indeed, a teaspoonful of fat will be seen to exude from the minute fissures upon its surface.

Strawberry Ice Cream.—This dish forms a delicious dessert on a hot day, and is easily made wherever the berries and cream can be had in sufficient quantities. Take a quart of berries after they have been hulled, and sprinkle over them one large coffee cup of fine white sugar; let them stand two or three hours, and then mash them up fine, and squeeze out the juice through a strong cloth. Add another large cup of sugar to this juice, and then stir in one quart of pure sweet cream, or a pint and a half of cream and the beaten whites of three eggs. Mix all together and freeze, and when half frozen, turn in one pint of fresh berries and freeze stiff. The juice needs to be made very sweet or else it will curdle the cream.

A Good Dish for Tired People.—Beat two or more eggs, the whites and yolks separately, add a little sugar and, if you wish, crumb crackers into the dish and eat. This will often agree with the stomach when it rejects other food; it is easily assimilated and can be taken without an appetite and without hindering the organs of digestion. Excessive mental or bodily fatigue renders the stomach incapable for the time of performing its office, and this simple dish will recuperate the strength until the person is rested enough to eat heartily.

Trifle.—In the bottom of a deep glass bowl place bits of sponge cake, it matters not how stale, cut into squares or strips; a small piece of preserved citron, also cut into very thin slices, interspersed with the cake. Soak these in a gill of some sort of pleasant sweet wine. Then fill up the bowl to within half an inch of the top with boiled custard, rich and cold. Lastly heap the bowl up high with whipped syllabub.

MINING AND SCIENTIFIC PRESS.

ECONOMY IN RAILROADING.—While the gross earnings of all the railroads in the United States in 1874 were $6,000,000 less than in 1873, the net earnings were $5,500,000 more—the operating expenses having been reduced to the extent of $11,500,000. This eleven and a half million dollars, as the annual savings in the cost of running the railroads of this country, means just so much money kept out of the pockets of dishonest contractors and managers and divided among the shareholders in dividends, or the people in the reduction of transportation. The improvement in the management may be fairly attributed to the clamor which has been raised within the two years just past against dishonest management, and the determined efforts manifested to inaugurate a reform in past abuses.

THE agent of the Central Pacific railroad company has succeeded in obtaining right of way of the branch line to Woodland, with the exception of two landholders who hold out for better prices.

Percentage of Gold.

There is one very marked defect in our system of gold mining that does not exist in silver mining, and which the sooner remedied the better. We refer to an entire absence of all positive knowledge as to what the ores being worked contain. The skillful silver miner, becomes daily, and often hourly, acquainted with the value of the ores being worked, and at the end of every run can figure up the percentage obtained and lost. If a large lose he immediately begins to investigate the cause and seek a remedy.

This is not the case with gold miners, who are usually perfectly oblivious of what their ore contains, contenting themselves in cleaning up what they can and considering it the best they can do. In this they may be right and may not, as they have no reliable data to work from. Possibly were they to adopt the course pursued in silver mining, they would often be aroused to an effort for bettering their results, if they found a serious loss was being sustained.

It is asserted by Mr. Almarin B. Paul, the inventor of the Paul process of dry amalgamation, that the gold mills of California do not on the average obtain over one-third of the value of the ores. This conclusion is arrived at after ten years' experience on ores from all sections of the State, and hundreds and hundreds of assays and other tests which he has made during this time. Mr. Paul is not alone in this opinion, but other of our oldest and most practical men hold to the same belief.

The *opinion* of many quartz miners is that they save from fifty to sixty per cent., but opinions as against positive critical investigations are not to be received.

Which view may be correct, we hope our gold miners will endeavor to determine by adopting such a system of assays as is used in silver mining. It is this close critical investigation into what they are doing, which not only makes silver mining popular but makes the silver miner the best possible gold miner. His education is such that he investigates, and thinks it very singular that our gold miners know so little of the value of their ores except by comparison.

Gold miners may say gold assays are unreliable. It is not so much its assays as the manner of selecting the rock which is to be assayed. If it is desired to take the trouble to get at the value of the ores being worked, it can easily be done. But ores must not be selected from specimen pieces, or one piece made to answer for a whole batch. Several methods may be suggested. One is to have your feeder take a piece of ore of given size from every shovelfull he fills for the battery, and after these pieces have accumulated to a hundred pounds or more, have the entire lot pulverized, *dry* sampled and assayed. To be certain, have half a dozen assays made and average the lot.

Another and possibly easier, but not so correct way will be, to collect every half hour a bucketfull of material as it flows from the battery, being as careful to retain the water as the crushed ore, for the reason that the water often contains as much as the sands. Continue this during a run. Allow the whole to settle well and then draw off the water carefully, dry the whole, mix well and properly sample for assay. This is but little trouble, and we think will tend to give our gold quartz miners some different views as to their loss and the value of their property.

Considerable data might be presented to support the belief in an unwarrantable loss of gold and lack of intelligent investigation in this direction among even our best gold miners; but, there now seems to be a general desire to better the past working, and we think that in endeavoring to awaken a renewed interest in investigation, considerable benefit will be the result.

The Southern Pacific railroad has made a reduction of fifty per cent. from the rates heretofore charged for freight transported between Los Angeles and San Pedro. The rate for general merchandise is now $2.50 per ton, and on grain, wine, etc., $1.50 per ton. Fare from Los Angeles to steamer, fifty cents.

IN the trial of Lee for participation in the Mountain Meadows massacre, the evidence has been closed and on Tuesday the 3d inst. the judge charged the jury. The result is being looked for with interest.

The Bay Sugar Refinery caught fire last Saturday morning; $25,000 damage to building and stock was done.

A BRIGANTINE 156 keel, thirty-nine feet beam fourteen feet hold and of 800 tons measurement will be launched at North Bend, Coos Bay, next Monday.

THE Columbia, Tuolumne county, marble mills have another contract for 500 tons of marble for the Palace hotel.

A NEW weekly paper called the *West Shore* has made its appearance, published at Portland, Oregon.

THE Capitol woolen mills, at Sacramento, have been rebuilt and are now in operation.

THE Galt and Ione railroad will be finished and running by the 1st of December next.

Notices of Recent Patents.

Among the patents recently obtained through Dewey & Co.'s SCIENTIFIC PRESS American and Foreign Patent Agency, the following are worthy of mention:

AERIAL AND MARINE GYRATOR.—Peter B. Fernandez, San Francisco. By means of a novel device and arrangement of mechanism, the inventor is enabled to govern and direct the motion of a propeller wheel, used either in the air or water, to guide either a balloon or a vessel, dispensing entirely with the use of the rudder or other appliance for steering. The invention patented also relates to the construction of a gasometer and the manner of attaching the car and propeller in such manner that the weight of the former shall be suspended from the most buoyant part of the gasometer, while the propeller is operated in front of the smaller and less buoyant end where its action will be most easily felt, and where also it will break the force of a head wind. In order to drive the propeller with facility in any of its positions, the inventor employs a peculiar jointed shaft which connects it with the motive power within the car. The gasometer or balloon is made in an elongated, conical form having its front end reduced as near a point as possible, while the rear end has a hemispherical head, similar to the ordinary balloon. The suspending netting is so arranged that the balloon will stand with its major axis in a horizontal position, and from that portion being the most buoyant, the car is suspended. This retains it in this position unless changed by the action of the propeller. The propeller is mounted upon a short rigid shaft which turns in boxes upon a frame or bar. The rear end of this bar is connected by a hinge link admitting of motion in any direction, with the forward end of an inclined bar which extends down to the car and by means of which the whole device is suspended along the lower side of the gasometer. The shaft upon which the propeller is mounted is driven by a suitable power within the car, and in order to admit of a free movement of the propeller, a flexible connecting shaft is employed. This shaft is made by using short sections, similar in size to the rigid part of the shafting. These sections are made so as to be hinged together, each section having the sections at its opposite ends bending at right angles to each other, so as to form a strong shaft which will at the same time work freely and smoothly whatever angle the propeller may stand at.

In order to move the frame and the propeller with facility, four arms are employed which project from the frame and are slightly curved backwards. Each arm has an eye at its outer edge, to which cords are secured and lead through fair leaders down to two windlasses, or drums, which are mounted upon the front end of the car, or boat. The cords are led to these windlasses in such a manner that on each windlass one set of cords passes around in opposite directions, so that when one cord is pulled the other will be slacked off, and one of the arms will be drawn down while the other will be allowed to move in the opposite direction; and the propeller can be operated so as to stand at any desired angle, at the same time being easily rotated by means of the flexible shaft. When it is desired to apply this arrangement to vessels the windlass can be so arranged as to allow their operating shafts to pass water-tight into the hold of the vessel and the flexible shafts must also pass through a stuffing box.

In the formation of his gasometer for aerial machines the inventor proposes to make a horizontal diaphragm extending through it from end to end. The space above this diaphragm will contain gas, while the space below may be filled with air. Whenever the gas expands it is allowed to enter the lower compartment and drive out the air; but when it contracts into the upper compartment, air is again admitted to the lower one so as to keep the gasometer always distended.

In attaching the propeller to a sub-marine vessel water, and air take the place of air and gas in the aerial machine, for the purpose of raising and depressing the vessel.

ROAD SCRAPER.—Abijah McCall, Saratoga, and James T. Watkins and Jasper F. Scott, of Santa Clara, Cal. This is an improvement in road scrapers, more especially that class of scrapers in which the scraper is suspended between two pair of wheels, so as to extend across the line of travel. The axles of two pair of wheels are connected by a single coupling beam, near the middle of which is constructed a turn table from which the scraper is suspended, so that it hangs below the beam and transversely to the travel of the wagon. The turn table is constructed by securing a circular plate by a bolt upon a circular section which is secured to the connecting beam. This circular plate has an arm extending out on each side, to which a metal plate is secured, extending out and beyond their ends. To the projecting ends of this plate are hinged hand levers constructed like a bell crank. A curved rod is secured to the turn table near each lever, so that it can be shifted to raise or lower the scraper at either or both ends, and fixed at any required position. A strong semi-circular metal plate has its ends secured to the rear side of the scraper and connected to it in the middle. Directly in front of the rear axle and parallel to it is secured a rod, the ends of which are supported in braces. The rods extend forward from each end of the curved rod before referred to, so that their forward ends will unite near the scraper and there secured to the bar, thus providing a pushing arrangement which acts from the rear of the machine against the middle of the scraper. The semi-circular plate before referred to, is provided with numerous holes and a brace having one end secured to each end of the curved rod ontside of the braces, while the opposite end is formed into a hook. When the scraper has been adjusted, the hook ends of these braces are secured in a convenient hole in the plate, so as to hold it in place. Any tendency to a side draft when the scraper is set is counteracted by an ingenious contrivance of the journals of the axles.

SODA BOTTLE CARRIER.—A. F. Knorp, San Francisco, Cal. This is a case or carrier especially for bottles which contain liquids under pressure, such as soda water, ginger beer, etc. Inside of the box is constructed a horizontal partition, through which are tapering holes in which the bottles are held. These holes are wider at the top than at the bottom, and their sides are concaved so that the shoulders of the inverted bottles will fit snugly in them. The holes are made close together so as to prevent the bottles from knocking against each other. The ordinary method of holding these bottles in place is to employ two partitions, one above the other. In this case, the holes in the upper partition are made large enough to admit the body of the bottle, while the holes in the lower one are only large enough to admit the neck of the bottle. This arrangement is not so simple and compact as that above described, and when soda bottles which were provided with automatic stoppers were used, the stoppers were frequently displaced by striking against the lower partition when placing the bottles in the rack, because the lower partition was concealed from view. By this arrangement this trouble is avoided. In one end of the case is made an opening near the bottom and below the partition, through which any broken pieces of glass or other rubbish which may get below the partition may be removed, and which will also allow liquid to run out. The case is provided with a lid, which is secured by a peculiar latch lock. The lock consists of a plate secured to the inside of the cover, to which a latch is secured by a bolt, which passes through its center and through the cover of the box. The latch extends on both sides of its central bolt. A curved slot is made in the plate near its edge and a pin on the under side of one end of the latch enters the slot. This pin enters the slot and limits the movement of the latch. A key serves to turn the latch from the outside when the lid is down, so as to cause its free end to enter a notch on the upper edge of the front side of the box.

PAPER FILE.—F. B. Alderson, San Jose. This invention relates to an improvement in paper files or holders, such as are need to temporarily retain newspapers. It consists of two parallel bars, which are connected by standards, having rule joints in the centre. Springs at each end of the two bars draw them together, when the joints are bent, and the standards will hold the bars apart for the introduction of papers, when they are straight, but will shut up and lie concealed when the bars are closed together.

The Toughened (Bastie) Glass.

Notwithstanding so much has recently been said upon the subject of the Bastie (toughened) glass, the general reader seems to be still eager to scan every new paragraph that finds its way into the public prints. Yielding to this general desire we note that another series of experiments with regard to the character of this glass has recently been tried in New York by Prof. Egleston of Columbia College before the New York Academy of Sciences.

The most wonderful characteristic of this glass, as developed by the Professor, was its marvelous power of resisting heat. In several of his experiments two thousand degrees of heat were directed on the center of a plate of prepared glass eight inches square, until at the point of contact with the flame the glass became red hot. The first plate was a poor one, and broke after being subjected to this heat for three minutes. The others were not broken by it. Ordinary glass stood such tests only eight seconds. The practical application of this was, that if a fire was started in a room with windows of this glass, the frame work of the window would burn out and allow the glass to fall before a draft would be created.

Lamp chimneys were then tested by using kerosene lamps with a combination of Bunsen burners, which threw a blue flame, showing that the heat was intense along the whole length of the tube and six or eight inches above it. Water was boiled in a vessel of this glass. The water boiled out and the vessel remained uninjured. The temperature of the vessel was then raised to 150 or 160 degrees and cold water was poured in with the expectation that it would crack the glass. But the water began immediately to boil, and the glass was unhurt.

THE Southern Pacific have graded forty miles beyond San Gorgonio on the desert, but have temporarily suspended work on account of intense heat.

Tempering Mining Tools.

In our issue of July 17th we inserted an article on this subject, and calling for further information has drawn forth the following suggestions from William Teal, our correspondent in Bingham, Utah. He says: I see in the issue of the PRESS of July 17th an excellent editorial on the above subject. Now, however expert the great majority of smiths may think themselves in this line, badly manipulated and tempered tools is still the rule. Charcoal, all coucnr, is preferable to hard coal, yet the latter, if free from sulphur, will answer very well if the mode of tempering which I shall mention is adopted. The heating, you correctly remark, should not be carried above the point of full redness. I will add, a rich cherry red without any approach to a yellow shade, and this makes the description perhaps a little more definite. Any amount of heat above this point produces some injurious chemical change in the steel, very likely a decarbonization, more or less according to the excess of heat. Heat the pick far enough back, say four inches, to allow time enough to complete the drawing before it has wholly lost or gone much below redness. A quick, skillful, smooth hammering is very important.

And now comes the tempering, which, if properly done, will avoid a great smount of needless annoyauce and loss of valuable time as well as nseless profanity. The following method, which I can most confidently vonch for from experience, I have known followed by two blacksmiths who made a specialty of this branch ot business, with notable success.

They first supplied the tnh with the purest water obtainable, into this threw about a peck of waste stnff from the forge, consisting of fine coal, cinders, and probably some horax, and after stirring, poured off the floating portion. Whether these constituents imparted anything to the water, and if so, whether the steel is affected thereby in tempering, is a question that may be correctly answered, I think, in the affirmative. This water they never changed, but replenished as occasion required. Heat the emplement as before, but not over halt as far back, immerse the point (if a pick) ahont an inch and with drsw regularly in ahont the time yon wonld be in counting five or six moderately. Wait till the heat has run down and blued to the point, then lay the pick on the fire, just ontside the flame *in the smoke*, where the temperature will not increase much, this for two or three minntes. Then remove, and with the hammer handle or other dry stick of hard wood, drew across the pick near the poiut. When the heat will gently ignite the little portion of wood scraped off thereon, immerse into the water, until nearly cold.

Although this description is minnte and prcs", it is easily understood and will pay, for it brings the steel to the highest point of efficiency in toughness and durability, excelling the ordinary method at loast a hundred per cent. A little practice will impart the necessary skill. More diversity exists in sharpening and tempering drills than with picks. Heat as in the case of picks, let the point in hammering rest firmly on the anvil, and in giving the bevel, project as little as possible, and do not strike after the redness has left, then heat as before and plunge into the water until cold. After trying many plans I find this the most satisfactory, and the great annoyance of drills checking is entirely avoided.

WHERE THE GOLD GOES.—It is estimated that $100,000,000 in gold and silver is paid annually by this country as interest to foreign bond-holders of national, state, city and railroad bonds; and at least $40,000,000 more is taken ont of the country, every year, by tourists. Moreover ourexports of miscellaneous products come short ot our imports by several millions, which balance must also be added to the enormous sum of $140,000,000 to meet our annual payments abroad. Were our gold and silver mines to cease producing for two or three years, we should become bankrupt as a nation; whereas, by a little more economy in our exports, or by a little more determined effort to produce at home that which we now buy abroad, the United States might soon become the richest and most properous nation on the globe. These facts are repeated year after year by the public prints; but the thriftless work of monetary depletion still goes on. The gold and silvor mines of the Pacific coast seem to be the only medium by which the catastrophy of national bankruptcy can be warded off. The nation can well afford to hold them free to all comers, and in every way to encourage their being worked to their utmost capacity.

PROSPERITY AT HOME.—It is a noteworthy fact that despite of the alarming depression in the iron interest throughout Europe, the eight Bessemer steel establishments in this country are every one of them running to their fullest capacity, with orders still coming in upon them; while at the same time three new establishments are nearly ready to go into operation. It may be further remarked that the iron interest, generally, in this country is unusually prosperous in all its departments.

The above, taken in connection with the facts that American iron and steel are both beginning to out-rank in quality the English product, and that certain brands ot American pig iron are finding a market in England, at rates profitable to American producers are most encouraging, and point to the probability that the United States will soon be independent of Europe for this important commodity.

FOREIGN ORDERS.—The Providence (R. I.) Tool Company, have received an order from the Turkish government for a sufficient quantity of Henry rifles to keep the works running for two years exclusively upon that order.

MUFFLE FURNACES AT THE QUICKSILVER MINES IN IDRIA, AUSTRIA.

Annealing Glass in Oil Nothing New.

As is well known, very important characteristics are imparted to glass by a process of annealing in oil, by means of which quite a high temperature can be attained and kept atwill. But this tempering in oil is not new, and no patent can be held except for the appliances by which it is done, and which may be different from those hitherto employed.

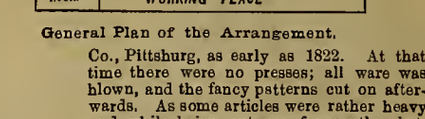
Prince Rupert drops, with which Bastie glass has been compared, are generally temnered by being dropped in water; but they were also dropped in oil a hundred years ago; those so prepared presenting quite different characteristics from those prepared in the ordinary way. More than halt a centnry ago the *Gentleman's Magazine*, in an article on tempering glass, gave the following: "If the glasses are to be exposed to a higher temperature than boiling water, boil them in oil."

Those who contemplate taking stock in the Bastie process at the high price at which it is held by the inventor, will do well before purchasing to recollect the above mentioned fact and to furthermore consult the agents and other processes of a similar character, which are now represented in New York or in Europe. If the papers are to be believed, Baur in Vienna, Pieper in Dresden, Stahl in Berlin, and Meuse in Geiersthal are busy with their processes of tempering glass.

In these times of wonderful discoveries it will not do to snppose that any one man can take and hold every avenue to any coveted result. Hence glass makers and steam engine manufacturers may possess their souls in peace notwithstanding the claims of either Bastie or Keeler.

A prominent Pittsburg glass manufacturer remarked, in reference to the Bastie process: "This new invention possesses little practical importance. The glass trade will not in any way be injured by the new article. Infact it would seem of benefit only as applied to window glass, and time is required even to demonstrate that idea. Although the *mode of application* is original with M. La Bastie, the tne principle of annealing glass in oil was in use at the works of Bakewell, Pears & Co., Pittsburg, as early as 1822. At that time there were no presses; all ware was blown, and the fancy patterns cut on afterwards. As some articles were rather heavy and while being cutwere frequently shattered by the vibration, it was desired to so anneal the ware as to obviate that serious difficulty. As a consequence the following idea was adopted:—A large iron kettle was filled with ware and fish oil poured over the whole until all the space was occupied. A fire was then started nnder the kettle and kept np until the highest attainable heat was secured, when the fire was allowed to die out and the glass cool gradually. In this way, the object was effected and there was no more trouble by the breaking of ware on the cutter's stone."

Fig. 5.



General Plan of the Arrangement.

WAKING UP THE BRITISH IRON MASTERS.—A correspondent writing the *Colliery Guardian* from Wolverhampton, under date of June 4th, says: "Samples of American iron have this week been shown in Wolverhampton, produced by Danks' puddling machine, and the quality of the iron and the comparatively low price at which it is sold, have excited not a little surprise. The whole question of mechanical puddling has been once again revived by this circumstance, and leading South Staffordshire ironmasters affirm that it will be necessary, if the district is to hold its own against rivals, not only to have puddling of iron done by machine, but also to apply the blast to the puddling furnace, by which means it is said, slack, instead of coal, can be used equally well for the process, at an obvious great saving in the cost of fuel."

JOHN R. SIMS, manufacturer of iron doors and shutters, jail and bridge work, cast and wrought iron railways, burglar proof bank vaults and safes, and all that class of iron work, is about removing from his old place on Oregon street, to the premises which have been so long occupied by the San Francisco boiler works, Nos. 123 and 125 Beale street. The buildings are now being put in order.

THE railroad from Colfax to Nevada city is rapidly approaching completion.

IMPORTANT

—TO—

MINE OWNERS.

LATEST INVENTION.

New Method of Working Rebellious Ores Without the Aid of Quicksilver.

R. J. KOHLER REDUCTION AND REFINING WORKS CO.

Incorporated April 27, 1874, with a Capital of $5,000,000, in 50,000 Shares of $100 Each.

ESTABLISHED FOR THE PURPOSE OF SMELTING ORES IN AN IMPROVED MANNER, and for the reduction and refining rebellious ores; also, by a newly patented process, producing the precious metals without loss or the use of quicksilver. These improvements have been fairly tested, and proved successful.

Location of the Worke,

At Damon's Landing, six miles east of Oakland, in Alameda county.

The Company's Property

Consists of just four acres of land, bounded on the east by the C. P. R. R. track (with a switch of 500 feet in length and telegraph at the works), on the west by San Leandro Bay, where the company's wharf can receive all water freights from foreign places.

Buildings.

A frame building, 60x100, well built, divided into business, assayer's office and laboratory, leaving ample room for the manufacture of concentrators.

A one-story brick building, 26x60, with an artesian well in it capable of throwing 45 gallons a minute, a 60-horse power engine and suitable boiler in place, with all necessary appurteuances.

Brickwork.

So far, about 600,000 bricks have been laid on the works, including with the above named brick buildings a chimney, 25 feet square at the base, and roasting, smelting and refining furnaces,

For the Concentration of Ores.

As far as practicable, particularly sulphurets, they will be concentrated at the mine before shipment to the company's works, thereby greatly reducing the cost of sacking and freight; thus enhancing the production of bullion at the works. Among the inventions belonging to the company is a portable and inexpensive concentrator of galvanized iron, capable of being worked by one-horse power and attended by a boy. By means of this concentrator in many cases ten tons of ore can be diminished to one.

Say that five tons of ore yield one ton concentrated, four-fifths of the freight is saved, and ore worth $200 per ton becomes worth.....$1,000
$150 per ton, worth..... 750
$100 per ton, worth..... 500
$50 per ton, worth..... 250

Profits.

It would be difficult to estimate the enormous profits which it is likely this company will realize when the works are complete and in full operation.

Numerous offers have been made to sell ores to the company, which assay very high, that cannot be worked by any process hitherto in use, but can by this company's new process. It follows the company can make their own price on such ores, taking their portable concentrator to the mine and reducing the ores previous to the shipment to the company's works. From one locality, there is a mountain of rebellious ore; the offer has been made to transfer at the rate of 500 tons per day, if required, and to sell the ore, assaying at from one to three hundred dollars per ton, at the rate of 20 per cent. of assay value to the company. The freight on the ore from this locality to the company's works will not exceed $20 per ton.

Capacity of the Works.

Ore can be reduced at the rate of 50 tons per diem until more furnaces are constructed. Taking 50 tons as a basis, at only $33⅓ profit, for 30 days (one month), would give the company $50,000.

All ores can be assayed at the works; orders taken at the office.

As an evidence of the superiority of the Kohler process of reduction over all others, it may be stated that before the incorporation of this company a quantity of mispickle ore, the most rebellious ore to be found in California, was taken and worked by said process, in the presence of a well known metallurgist, and made to yield at the rate of $52.20 per ton.

In many instances the result of working gold-bearing sulphurets exceeds the rate of the most carefully made assays.

Money Expended.

Up to the present time, about $45,000 has been laid out, and only those interested can tell the struggle the inventor has passed victoriously through, amid the cold shoulder from nearly every one. The present state of the works has only been reached by the sacrifice of stock to a large amount; some shares disposed of at par (originally), and others at lower figures, as necessity required. The principal holders of the stock donated about ten thousand shares to fully complete the works, some three thousand of which have been sold at various prices, and the remainder, when sold, will furnish ample funds to enable everything to be in full working order by September 1st. In fact, the roasting and smelting could be commenced by the middle of August.

Looking at these works in a mere hard business view, even as an ordinary smelting R. and R. W., the investment would be a secure one. Costing in all, say some $60,000, when well known smelting works in San Francisco have made a large fortune on the old plan, the various new Kohler inventions give a wide margin for profits.

The fact of reducing rebellious ores in our own State without shipping the same to England, or having the alternative of abandoning the mine, is a strong point; and the Kohler concentrator can be obtained by mine owners at about $3 000 each, in place of paying from $30,000 to $50,000, as they have been doing heretofore.

A few thousand shares remain for working purposes, and can be obtained at the office, southwest corner of Pine and Sansome streets.

There is not the slightest possibility of any assessment ever being made on this stock.

(Signed) H. P. EAYRS,
Secretary.

THE NEVADA

QUARTZ MINING PROPERTY FOR SALE,

With a new 15-stamp mill, now running. Has its own water power, with houses, shops, etc. Government title; joins the Providence mine, on Deer Creek, Nevada City, Cal. For sale or to bond.

Address, I. S VAN WINKLE,
413 Market street, San Francisco.

WIRE ROPE

For Mining, Shipping, and General Purpoees.

All kinds and sizes on hand, or made to order; guaranteed of unsurpassed quality, and manufactured of any length. FLAT ROPES, ROUND ROPES and TAPER ROPES, of IRON OR STEEL.

Patent Endless Wire Ropeway

(WIRE TRAMWAY,)

FOR THE RAPID AND ECONOMICAL TRANSPORTATION OF ORES AND OTHER MATERIAL OVER MOUNTAINOUS AND DIFFICULT ROADS.

This system has been in use for over three years, and given thorough satisfaction.

AMMONIA!

For Washing and Cleaning Purposes.

For Sale by all Grocers.

This article is universally used in Europe, and, recently introduced for general family use in San Francisco and neighborhood, is already in great demand. It is now the intention of the manufacturers to introduce it all over the Pacific Coast, at prices which will bring it within the reach of every household.

It is unequalled for cleansing Woolen Fabrics, Cutlery, Carpets or Crockery; for Scrubbing Floors, Washing Paint, Removing Grease Spots, Shampooing or Bathing.

It renders water soft, and imparts a delightful sense of coolness after washing.

DIRECTIONS.—For Laundry, use two to four tablespoonfuls to a washtub of water. For bathing, use one tablespoonful in the bath tub. For removing grease spots, apply with a brush, undiluted, and wash with water afterward. For stimulating the growth of plants, use a few drops in every pint of water used in watering.

PRICE.—Per Pint Bottle, 25 cents; per quart Quart Bottle, 40 cents; per Half Gallon, 75 cents.

Also, SULPHATE OF AMMONIA for chemical purpose, fertilizing, and the preparation of artificial manures. AMMONIACAL PREPARATION, for the prevention and removal of boiler scale. CRUDE AMMONIA, for general manufacturing, and PURE LIQUOR and AQUA AMMONIA for chemical and pharmaceutical purposes.

The Mining Share Market.

Since our last issue the stock market haa shown a much stronger feeling. Saturday the market closed qnietly, but the preaent week opened very firmly and except a short lull during Tueaday, prices have steadily advanced. Wsdnesday afternoon especially, the excitement increased to fever heat, and California street was alive with an eager throng until well into the evening. This morning, (Thnrsday) the market was a little off and during the day there has been a tendency towards softness. It is the general impression, however, that the market will continue firm and prices will stsadily appreciate.

UNITED STATES

Mineral Land Laws, Revised Statutes,

And Instructions and Forms Under the Same.

We have just issned a pamphlet containing the general mineral land laws of the Unit·d States, with instnctions of the Commi-sioner of the Land Office The contents of this pamphlet comprise all of the Government laws with relation to mineral lands of interest to the mining community, as follows: Mining Statute of May 10th, 1872, with Instructions by the Commissioner of the Land Office; Mining Statute of July 26th, 1866; Mining Statute of July 9th, 1870 Forms required under Mining Act of May 10th, 1872, as follows: Notice of Location; Request for Survey; Application for Patent; Pr. of of Posting Notice and Diagram of the Claim; Proof that Plat and Notice remained Posted on Claim during Time of Publication; Registers' Certificate of Posting Notice for Sixty Days; Agreement of Publisher; Proof of Publication; Affidavit of $500 Improvements; Statement and Charge of Fees; Proof of Ownership and Possession in Case of Loss or absence of Mining Records; Affidavit of Citizenship; Certificate that no Suit is Pending; Power of Attorney; Protest and Adverse Claim; Non-Mineral Affidavit; Proof that no Known Veins Exist in a Placer Claim, etc. There is also given the U. S. Coal Land Law and Regulations thereunder. The work comprises thirty pages, and will be sold, post-free, for 50 cents. It should be in the hands of every one having any mining interests.

DEWEY & CO.,
Publishers of MINING AND SCIENTIFIC PRESS, S. F.

N. B.—We have also added to the above publication the REVISED STATUTES OF THE UNITED STATES, so far as relates to Mining Laws.

MINING SHAREHOLDERS' DIRECTORY.

Compiled every Thursday from Advertisements in the Mining and Scientific Press and other S. F. Journals.]

NOTE.—Copies of U. S. and Foreign Patents furnished by DEWEY & Co., in the shortest time possible (by telegraph or otherwise) at the lowest rates. All patent business for Pacific coast inventors transacted with perfect security and in the shortest possible time.

A LETTER from the Superintendent of the Sonoma Meadows reclamation company, says the work is progressing satisfactorily and rapidly.

THE proprietors of the "Hamman" are sinking an artesian well in this city. Sand is still found at 170 feet depth.

SAN LUIS OBISPO will soon be illuminated with gas.

THERE are 15,000 idle operatives in Fall River, Mass.

The Mechanics' Fair opens on the 17th inst.

MODERN WOMEN.

It is a sad commentary upon our boasted civilization that the women of our times have degenerated in health and physique until they are literally a race of invalids—pale, nervous, feeble and back-achy, with only here and there a few noble exceptions in the persons of the robust, buxom ladies characteristic of the sex in days gone by. By a very large experience, covering a period of years, and embracing the treatment of many thousands of cases of those ailments peculiar to women, Dr. Pierce, of the World's Dispensary, Buffalo, N. Y., has perfected, by the combination of certain vegetable extracts, a natural specific, which he does not extol as a cure-all, but one which admirably fulfills a singleness of purpose, being a most positive and reliable remedy for those weaknesses and complaints that afflict the women of the present day. This natural specific compound is called Dr. Pierce's Favorite Prescription. The following are among those diseases in which this wonderful medicine has worked cures as if by magic, and with a certainty never before attained by any medicines: Weak back, nervous and general debility, falling and other displacements of internal organs, resulting from debility and lack of strength in natural supports, internal fever, congestion, inflammation and ulceration, and very many other diseases incident to women, not proper to mention here, in which, as well as in the cases that have been enumerated, the Favorite Prescription effects cures—the marvel of the world. It will not do harm in any state or condition of the system, and by adopting its use, the invalid lady may avoid that severest of ordeals—the consulting of a family physician. Favorite Prescription is sold by dealers in medicines generally.—*Com.*

Every Mechanic

Should have a copy of Brown's

507 MECHANICAL MOVEMENTS,

Illustrated and described.

Inventors, model makers and amateure mechanics and students, will find the work valuable far beyond its cost. Published by DEWEY & Co., Patent Agents and publishers of the Mining and Scientific Press. Price, post paid, $1.

WOODWARD'S GARDENS embraces an Aquarium, Museum, Art Gallery, Conservatories, Tropical Houses, Menagerie, Seal Ponds and Skating Rink.

SUBSCRIBERS who are troubled in getting their papers regularly from the P. O. should be particular to mention the name of the paper.

TENTH
Industrial Exhibition
UNDER THE AUSPICES OF THE
MECHANICS' INSTITUTE,

Will be opened to the Public at the INDUSTRIAL FAIR BUILDING, EIGHTH STREET, FROM MARKET TO MISSION, on

TUESDAY, AUGUST 17, 1875,

At eleven A. M., with the usual ceremonies.

THE HON. W. J. SHAW

Will deliver the Opening Address. By the addition of the New Horticultural Department 20,000 feet exhibitors' space have been added to the building.

Any stock upon which this assessment shall remain unpaid on the 16th day of August, 1875, will be delinquent, and advertised for sale at public auction, and unless payment is made before, will be sold on Monday, the 6th day of September, 1875, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Directors.

O. H. BOGART, Secretary.

Office, room 1, No. 402 Montgomery street, San Francisco California.

PACIFIC RURAL PRESS,

A first-class 16-page Agricultural Home Journal, filled with fresh, valuable and interesting reading. Every farmer and ruralist should take it. It is immensely popular. Subscription, $4 a year.

DEWEY & CO., Publishers,

No. 224 Sansome street, SAN FRANCISCO.

THE MINING AND SCIENTIFIC PRESS, of San Francisco, entered upon its thirty-first semi-annual volume last Saturday. It is most appropriately named, and sustains well its name, containing more really useful information upon mining, scientific and kindred subjects, than any other paper on the Pacific coast. Dewey & Co., the publishers, are well known as agents for securing patents; in fact, most of the patents for inventions on this side of the continent are secured through them. The PRESS is deservedly prosperous. —[Gold Hill News.

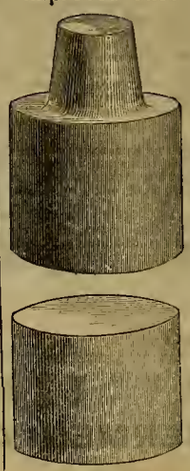
Improved Cast and Forged Steel Shoes and Dies for Quartz Mills.



[PATENTED MAY 26TH, 1874.]

Price Reduced to 16 Cents Per Pound.

SAN FRANCISCO, November 10th, 1874.

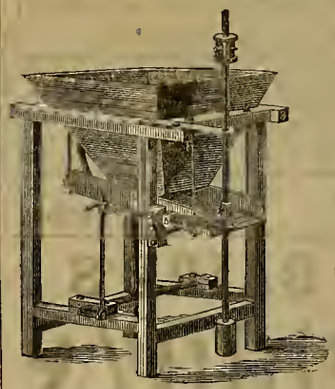
To Supts. of Quartz Mills and Mining Men generally:

We take pleasure in stating that owing to the rapid increase in our orders, our Pittsburg Manufacturers have been compelled to add largely to their works—a new gas furnace and heavier trip hammer—and are thus enabled to reduce the cost of steel and at the same time produce SHOES AND DIES superior to any yet manufactured. We have consequently reduced the price to 16 cents per pound and solicit a trial order, guaranteeing that you will find them at least 10 per cent. cheaper than the best iron. There are no STEEL SHOES AND DIES made excepting under our patent and sold at this office, or by our authorized agents, though certain Eastern manufacturers advertise STEEL SHOES AND DIES which are only cast iron hardened by the addition of a composition. They will not out-wear two sets of common iron, though called steel. They are very brittle and are not capable of being tempered, flying from under the hammer like cast iron. Our STEEL SHOES AND DIES are in use in many of the largest mills on the Pacific Coast, and all who have tried them pronounce them cheaper and far superior to iron in every respect, even at the old price of 20 cents per pound. Their advantages over iron are cheapness on first cost, increased crushing capacity, time saved in changing and in setting tappets, increased value of amalgam by absence of iron dust and chippings, and a saving of 75 per cent. in freight. It takes 60 days to fill orders from the manufactory East. Price 16 cents per pound shipped at San Francisco. Terms liberal.

Address all orders, with dimensions, to

1v29-3m CAST STEEL SHOE & DIE CO., Room 1, Academy Building, S. F

Tulloch's Automatic Ore Feeders.



Will Feed Wet or Dry Ore Equally Well.

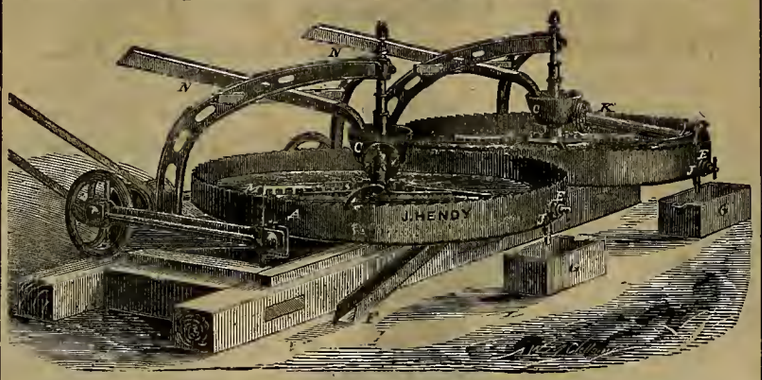
OVER $3,500 PER MONTH SAVED

BY THE USE OF

Hendy's Improved Amalgamator and Concentrator



Can be seen at the Manufactory, No. 32 Fremont Street, San Francisco.

SAN FRANCISCO, April 27, 1872.

JOSHUA HENDY, Esq.—*Dear Sir:*—As a practical miner and millman, I take pleasure in recommending the use of your Concentrators in all mills where gold or silver ores are reduced. No mills should be without them, for the following reasons:

1st. They are good sizers (no perfect concentration in pulverized ores can be effected without first sizing).
2d. The best Concentrator I have ever known—(the concentrated stuff only containing 5 per cent. of sand).
3d. They are good amalgamators, light (feathery) particles of amalgam and particles of coated gold by attrition are brightened, and from their specific gravity and the action of the pan, fall to the bottom and adhere.
4th. They require but little power and attention to run them, and with ordinary care will last for years.

I have been familiar with the workings of your Concentrators for four years past; have run them myself in the North Star Mine, Grass Valley; am familiar with their practical workings on the Empire Mine, Grass Valley; St. Patrick, Placer Co.; St. Lawrence, El Dorado Co.; Oaks and Reese, Mariposa Co., and most cheerfully give you this testimonial. For further information you are at liberty to refer to,

Yours respectfully,
JAS. H. CROSSMAN, M. E.
409 California street, or Cosmopolitan Hotel.

SAN FRANCISCO, February 10, 1874.

OFFICE SUPERINTENDENT OF KEYSTONE CON. M. CO., AMADOR, AMADOR COUNTY.

MR. J. HENDY—*Dear Sir:*—In answer to your inquiries as to your Concentrators furnished our company last July, I would say that I am more than pleased with them; and the saving to the company has been over $3,500 per month more than with the blankets and huddles formerly in use. O. C. HEWITT, Supt.

OFFICE SUMNER MINE, KERNVILLE, April 27, 1874.

J. HENDY, Esq.—*Dear Sir:* Having four of your Concentrators in use at our Mills for four or five months, which for saving Amalgam and for concentrating Sulphurets, are a success, beyond a doubt, I feel it a duty due you and those interested in Quartz Mills, to recommend them.

As further evidence of their worth, I now order TWELVE more of your Machines for our new Mill, now in course of erection. E. R. BURKE, Superintendent.

For description send for Circular.

JOSHUA HENDY, San Francisco.

MINING AND SCIENTIFIC PRESS.

An Illustrated Journal of Mining, Popular Science and General News.

BY DEWEY & CO., Patent Solicitors.

SAN FRANCISCO, SATURDAY, AUGUST 14, 1875.

VOLUME XXX Number 7.

The State University.

We have received a copy of "Bulletin No. 18" of the University of California, containing programme of instruction in the College of Agriculture for the coming session, as well as the plan of operations adopted for the purpose of rendering instruction in that department more directly useful in its application to practice. Prof. Hilgard is untiring in his efforts to render the Agricultural Department of the University a success. In addition to the collections belonging to the University, the Professor has deposited in the lecture room of the Agricultural College, for the use of the students, his own private collection of specimens of plants, arranged and classified expressly for the purpose of instruction and investigation.

An Important Movement.

The Regents of the University, on the recommendation of Prof. Hilgard, have initiated an important movement to the following effect: They have made an appropriation and authorized the appointment of an assistant analytical chemist, with a view toward the inauguration of a system of thorough investigation of the agricultural and industrial resources of the State, or what might be termed an industrial survey of the same. Such a work is the needful complement of the geological and topographical surveys already made, the results of which it will utilize and expand, and render practically available to the people by their direct application to everyday life.

In carrying out this work, the investigation of soils and their relations and adaptations to crops will necessarily form an important matter. The proposed plan for the accomplishment of this work will be to obtain, first, a full knowledge of the occurrence, location, extent, natural peculiarities and climatic position of each prominent variety of soil, by examination in the field; and at the same time to elicit, by inquiry from those cultivating it, whatever information or experience they may possess in regard to it—thus gaining practical suggestions as to the most immediately important points to be investigated.

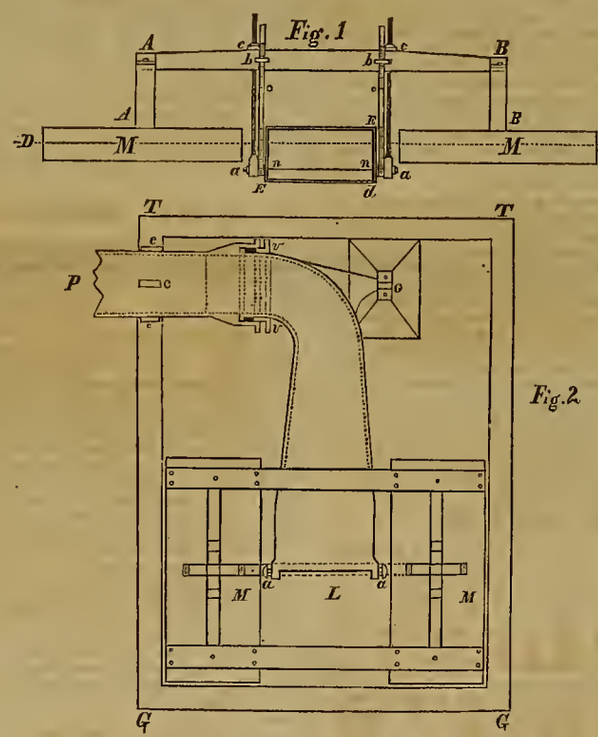
Such tests, remarks the "Bulletin," should most properly be made at local experimental stations, established in the various agricultural subdivisions of the State, as is done in Europe and some of the Eastern States. The co-operation of agricultural societies and individuals, willing to aid in this work, is most earnestly requested.

The knowledge thus obtainable of the leading agricultural features of the State would enable farmers to purchase and cultivate more intelligently and profitably; and will render possible the publication of an important class of information, not now attainable, though greatly desired by every immigrant, which at the same time would prove the best possible advertisement of the agricultural advantages of the State. The students of our Agricultural College, possessed of this information in addition to that acquired in the regular course of studies and practice, would go out with a definite knowledge of what they will have to meet with in actual life, and be thus prepared to turn their knowledge to the best practical advantage.

A thorough knowledge of the agricultural features of any State is an important condition precedent to instruction of a truly practical character in its Agricultural College, as well as of a judicious selection and execution of experiments in culture. Nor is such knowledge less important in its bearing on the general interests of progressive agriculture, and in the promotion of immigration. Hence it is desirable that all intelligent agriculturists throughout the State will aid in the important work about to be inaugurated. The work cannot be carried out without their co-operation, unless undertaken with vastly greater means than those now at the command of the University Board of Regents. The "Bulletin," containing a more detailed description of the work, together with an earnest appeal for co-operation, will soon be forwarded to all agricultural societies throughout the State, to the different Granges and to all individuals who, it may be thought, will take an active interest in this matter.

Guerin's Water Distributor and Meter.

Thomas Guerin, resident engineer of the Oakland harbor improvement, has invented an instrument for measuring and distributing water for irrigation and mining purposes, a sketch of which is given herewith. Figure 2 is a plan of the instrument as it appears by looking at it vertically. *P*, *L* is a right angled pipe divided at the joint, *v*, *v*, into two sections, *P*, *v*, and *v*, *a*, *a*, *v*. The section, *v*, *a*, *a*, *v*, forms a right angle, and at the joint, *v*, *v*, extends for a short distance into the section, *P*, *v*, and is capable of revolving therein. The section or portion, *P v*, is stationary, being imbedded in masonry and held by the flanges, *e*, *e*. At the angular bend of the pipe is a projection, forming a heel which



Guerin's Module or Irrigation Meter.

terminates in a gudgeon or journal at o, and is supported in a journal box, thus securing in a horizontal position that portion of the pipe between *P* and *o*. At the entrance, the pipe has a rectangular section, Fig. 1, which it preserves for a short distance as in Fig. 2, and then tapers to a circular form.

Figure 1 is a vertical section at the entrance of the pipe. The floats are connected by a frame *A*, *B*, *B*, *A*. The entrance of the pipe is suspended from the cross beam, *A*, *B*, by two screw rods, *c a*, and is raised or lowered by means of the nuts, *c c*, on the upper surface of the beam. A portion of the entrance of the pipe is closed at *E*, *n*, *n*, *d*. Adjacent to the screw rods there are two graduated scales on which are registered the number of cubic feet of water per minute which is entering the pipe. There are two graduations on each scale, all four registering alike. The figure at which the water line, *D*, *D*, stands, will indicate the number of cubic feet per minute passing into the pipe. On the beam, *A*, *B*, there are two brass keepers, *b*, *b*, which serve to keep the scale in an upright position and which answer also as indices, showing on the upper scale what is registered on the lower. These upper graduations are useful, as they register correctly when the lower registering may be disturbed by the agitation of the water.

When it is necessary to discharge a certain quantity of water, the nuts, *c*, *c*, are screwed up or down until the indices are at the required figures on the scale; the figures on the lower scales will then also be in the required positions.

The instrument is inclosed in a box of masonry or wood (*T*, *G*, *G*, *T*, Fig. 2), which has sluices or apertures at the back to admit water to the instrument. The water is delivered at *P*. It is evident that however high the water will rise in the box, or outside the box in the supply reservoir, the floats, *M*, *M*, will keep the orifice, *E*, *E*, at the same level with respect to the surrounding water, and nothing can increase or diminish the flow through the pipe but the action of the nuts at *c*, *c*. The box inclosing the instrument is covered on the top with iron or wire grating, so as to enable any one to reach the scales. This grating is secured with a lock and key, and will prevent the observer from meddling with the instrument.

Mr. Guerin claims for this instrument, that wherever placed the quantity of water it discharges will not vary, however the level of the canal or reservoir of supply may vary. It will be impossible for any person but the party in charge to increase or diminish the flow therefrom. The machine is self acting and requires attention only when the discharge is to be increased or diminished; and the discharges can be increased or diminished to the required amount by the mere adjustment of the apparatus, no calculation being necessary. The nominal discharge being once agreed upon the apparatus can insure constancy from large or small outlets, thus insuring a method of distribution without any loss of head, injury to navigation or loss to consumers.

The instrument can be constructed of wood or metal at a small cost, and its manner of working is so simple as to require no more than the most ordinary intelligence to adjust it, thus avoiding risk of its being injured by awkwardness or ignorance. The recipient of the water, without being able to meddle with the instrument, can see at all times whether he is receiving his proper quantity; and it effectually opposes all fraud or alteration, by which a greater quantity could be obtained than agreed upon. The instrument can be made of any desired size, so as to discharge a small or large quantity of water. In a country like this, where so much water is used for mining and irrigation purposes, an instrument of this character is very desirable, as it serves as a check on both seller and buyer, and the latter can tell whether he gets what he pays for. Mr. Guerin will furnish further information to those wishing it, who may address him at Oakland.

Influence of Mechanics' Fairs.

[From Advance Sheet of the Mechanics' Fair Daily.]

No plan has ever been devised of such direct and immediate efficacy for the cultivation of the mechanical, inventive and artistic genius of a people, as local mechanics' fairs. These exhibitions have had much to do in giving the United States its proud position in the van of all nations for the inventive skill of its artisans, the superiority of workmanship, and the manufacture of machinery for so wide a range of purposes.

In our own young State, who will deny that such fairs have accomplished important ends in giving an impetus to arts and manufactures by offering the incentive of reputation and reward for excellence in every branch of local industry. The high value of labor among us has doubtless considerably retarded the progress of all branches of manufacture, and has prevented many of our valuable natural productions from being brought into commercial importance. But, with this severe drawback to contend against, the advance of California in the arts, agriculture and manufactures, as exhibited by specimens at the Mechanics' Fair, is gratifying and important. One very important lesson these fairs have taught the people with incalculable advantage to the country, has been the intimate relationship between art and science.

There were good artificers to brass and iron, before the principles of true science were conceived by man; but it was left until they were understood to invent the steam engine, the electric telegraph, and the sewing machine. The mighty pyramids of Egypt were erected without this knowledge, but the agencies that quarried the rock and piled up these works of labor without art or science, to be a wonder to all future generations, could not send mens' messages of business or love around the world, with greater speed than light itself, through the air, the earth, or the waters beneath.

There is a singularly beautiful illustration of this fact presented in the department of machinery. Here we find engines constructed with marvelous ingenuity, in beautiful proportions, and seeming to work almost automatically. The very nature of the inventions introduced at this Fair speaks volumes for our mechanics. We see powerful and effective machines for crushing the hardest rock to the finest powder, for pumping large volumes of water from vast depths, sawing the largest logs that grow in the world, to save the inpalpable particles of the precious metals, to sow, reap, gather and separate the immense grain crops of the State, to force a way through solid rock in tunnels and shafts, and to do a multiplicity of things which a century ago were done at the expense of great labor and time, and without the aid of machinery. The very building that contains all these trophies of the victory of mind over matter is a work of mechanical art, and a casket worthy of containing the many gems of human thought, wrought into forms of power, utility and beauty, more glorious than the diamonds, rubies, emeralds and pearls of the Orient and Occident combined.

Work on the line of the Sonoma and Marin railroad is progressing satisfactorily and there is every probability that the contracts for grading will be completed within the stipulated time.

The San Francisco and North Pacific railroad have indicated a purpose to soon build a branch from Fulton to Guernsville. The route was surveyed and the right of way secured last year.

The Cochice mills at East Rochester, and the shoe factory at Great Falls, N. H., which have been closed the past month have started up again.

The Chico mills have been repaired and fitted with improved machinery.

An experimental artesian well is to be bored by parties in Ukiah city.

They talk of starting a basket factory in Healdsburg.

Fatal Accident in the Eureka Consolidated Mine.

The Enreka *Sentinel* of the 31st ultimo gives the particnlars of a fatal accident which occurred in the Eureka Consolidated mine the previons day:

About two o'clock in the morning of July 30th Reane Atkins, who was acting temporarily as shift boss, noticed a slight crumbling of earth overhead near the end of the drift which opena into the seventh level. While the occurrence did not cause him any serious apprehensions, his hnbitual caution, the natnral result of a mining experience of many years, caused him to watch the place closely, and in abont an hour afterward he discovered that a piece of gronnd about twenty feet square was gradually settling. He immediately called the men who were working on the level—twenty-seven in number—to come inside the drift while he went up in the cage to call Mr. Congdou, the foreman. Mr. Atkins at that time did not anticipate an extensive cave, as the rest of the ground seemed secure, nnd only called the men from the chamber for fear they would he shut in from the closing up of the end of the drift. Upon being called, Mr. Congdon came down into the mine and immediately began making preparations for placing extra supports under the settling ground; but before the timbers could he procured the crash came, extending from the fifth down to the seventh level and completely closing up their entrances. The lights were blown out in the drift where the men had collected, and a scene of indescribable confusion and panic ensued. Several were knocked down by concussion of the air, and we understand a nnmber were slightly injured in the rush which was made for the station at the other end of the tunnel. Finding, however, that the drift was secure, in a short time light was struck and order restored, when it was fonnd that five men were missing—C. R Gates, Patrick Leary, Edward Duffy, Timothy Leahy and Henry Beckstead. These nnfortunate men were working in a chamber between the sixth and seventh levels, and were warned by Wm. Jolin and David Foote, who urged them to come down into the drift as the ground was caving helow; but everything appearing so secure in their vicinity, the men, four of whom at least were experienced miners, ridiculed the idea of danger and contiuued their work until the crash came, when it was too late to escape, and they were buried beneath the overwhelming mass of earth and ore which came down upon them from the upper levels. As soon as the men in the drift had recovered from their panic, they set to work with a will to recover the bodies of their dead comrades, and in the course of an hour the remains of Gates and Leary were exhumed. They were found in a chamher below the one in which they had been working and near a man-hole which connected the two compartments. There was but a small amount of earth on their bodies, which were scarcely bruised, and it is supposed that they were either thrown or jumped through the aperture and were killed by the concussion of the air. The search has since heen continued without intermission for the other bodies, but up to the present writing without result.

C. R. Gates was an American by birth, about fifty years of age, and leaves a wife aud two children residing in Virginia City. Patrick Leary was a native of Ireland, aged about twenty five, and leaves a wife and three children at Ruby Hill. Edward Duffy was a native of Ireland, aged about thirty-five, and single. Timothy Leahy was also an Irishman by birth, nnd, we believe, leaves a family in the East. Henry Beckstead was a native of Matilda, Canada West. He was unmarried. The disaster appears to have heen one of those which could not have been foretold or averted by human foresight. The gronnd, with the exception of a small portion before described, appeared perfectly firm aud secure, and no blame can be attacbed to those having the management of the works. As the openinga are blocked up, no estimate can be formed of the extent of the cave. The Coroner's jury rendered a verdict in accordance with the facts.

Railroad Cars.—The number of cars now running on the railroads in the United Stateais 400,000, supported by nearly 4,000,000 caat-iron wheels, most cars have eight, while some have twelve wheels. The maximum load each wheel is expected to he ahle to carry is four tons. Thoy cannot, however, run forever, but crack by the continuous vibration to which they are exposed while rolling rapidly on the rails, after having run a distance averaging 12,000 milea. The railroad companiea are therefore coustantly on the watch to detect any crack, in which case a car is directly withdrawn from the train, aa its breaking down while in motion endangers the whole train, iuvolving perhapa the destruction of life aud property.

The Jetty at the Mouth of the Mississippi. —Profeaaor William Hagan, of the Academy of Civil Engineera, Berlin, predicts the fnilure of the jetty ayatem, now being constructed at the mouth of the Missiasippi, and declares that the large amount of money appropriated by Congreas for that work will be a total loaa.

It ia said that aweet oil rubbed on the skin is a snre antidote for ivy poiaon.

Adulteration.

The skill of the sophisticators is hy no means confined to articles of food and drink. This is well illustrated by a controversy that has been recently taking place between the wool manufacturers and the Secretary of the Treasury. The wool mannfacturers complain that a certain class of goods is being imported at a low rate of duty which should pay a much higher duty. They say that these contain wool, whereas they are imported as containing only hair and vegetable fibre. The Treasury Department is at a loss what to do in the matter. They have employed experts to examine the goods, and they have failed to decide the question; the fact being that sheep produce both hair and wool, and that it is impossible to distiuguish between the hair of a sheep and the hair of certain other animals. Further, the fine hair found next the skin of many animals closely resembles wool; so that the microscope fails to distinguish whether the article is made of hair or wool. Chemistry is equally at a loss, the ultimate composition heing the same.

Linen is extensively adulterated with cotton. The microscope will nt once show this mixtnre, hut it fails to distinguish betweu linen and certain other fibres.

The mixture of cotton and wool has passed bayond the point at which it can he called an adulteration. Certain goods, such as flannels, are regularly made partly of cotton, and are more desirable than if made entirely of wool, as they do not shrink so much in washing.

The adulteration of woolen goods wifh second-hand wool has become so notorious that it has supplied a new word to the language, and the "shoddy" business has become large and respectable. Old woolen rags were formerly of little value, heing used maiuly for making cyanides or as a fertilizer for hops. Now they are ron through a machine, torn to piecas, carded, and the longest and hest of the wool nsed for mixing with new wool to make cloth. The shortest of the fibres, or dust, is used for making velvet or flock paper for covering walls, and for various other purposes. This shoddy cloth looks well at first, bnt it soon wears out aud becomes nseless. The shoddy made from old carpets is nsed for making wool mattressea.

Recently, considernhle attentiou has been called to the habit of weighing black silks. Some of the heavy silks are said to he fully one half dye-stuff and mordaut. Nor do cotton cloths escapé this process; they are "finished" with starch and china clay.

In the conrse of a receut discussiou of this subject before the London Society of Arts, some of the members claimed that pnre unweighted cloths could not be sold in the Indian and Chinese markets, and that in order to sell their goods at a profit they must be weighted. This is a plea that ia frequently brought forward by such gentlemeu, but it ia radically and totally false. The public will buy whatever they find in the market, and they are not slow to learn where they get the best goods for their money. In this connection the recent discussions in the New York Dairy Association iu regard to coloring butter and cheese is worth notice. They decided it was justifiable, or, in other words, that a man who makes a white, unsalahle article is entitled to color it, so as to mislead people into thinking it good and rich.

A Lake Superior Silver Mine.

The *Mining Journal*, published at Marqnette, Michigan, gives an interesting account of the first test of the amalgamating works on Iron river. The result is a brick of silver bullion weighing thirty-six pounds and 950 fine. The *Journal* says:

This result was obtained from the manipnlation of twenty-two tons of rock carelessly mined more than two years ago, and which has since been picked over by hundreds of people in search of the richest specimens of native silver. The fact that the rock, containing as it does a sulphuret, has been exposed for over two years to the actiou of the atmosphere, proves also that the test was far from being the best that might have been obtained from the same mine had the ore been taken direct from the vein. As it is, however, the result is of the most gratifying character, and proves beyond a doubt that the vein is not only a paying one but one that will eventnally, should it prove durable, rival some of the far-famed argentiferous deposita of Colorado and Nevada. The average of the teat, not taking into acconnt the amalgam absorbed by the pans, which were new, and the slag which remaius to be smelted—figuring the result only from the amount of silver in the brick now in the posaession of the Ontonagon company—showa a yield of $33.28 per ton, which, in our opinion, is about half the average yield of the vein. However, it is claimed that a yield of $25 per ton will pay large dividends over the cost of mining and milling the ore, which last we are assured will not exceed $9 per ton, including incidentals. Taking $25 per ton aa the basis, and it is easy to arrive at an approximate eatimate of the value of the vein, which at most places where opened, carries a width or thicknesa of between three and four feet, and gradually widening as greater depth ia attained. A mine capahle of raiaing fifty tons per day, a product which can easily he achieved at either the Scranton, Ontonagon or Collins, and also at aome of the more recently developed locations, would thns be assured a net profit of $800 per day.

The mill started on the 2d, and one ton of rock per day was stamped and amalgamated until the 9th, when the amount was increased, though the largest quantity treatad in any one day was three tons and a half. The run was as follows: On the 3d, 4th, 5th, 6th, 7th and 8th, one ton per day; on the 9th, 1½ tons; 10th, 2 tons; 13th, 1½ tons; 14th and 15th, 3 tona each; 16th, 3½ tons; 17th, 1¼ tons—22 tons in all. The amalgam which weighed 220 lhs., was placed in the retort at noon on the 18th, the result being forty pounds, which was again placed in the crucible and smelted, turning ont a brick weighing 523 ounces of the value of $732.20, currency. It is estimated that at least $300 was lost by the amount of amalgam absorbed in the coating of the pans and the slag caused by the loosening of particles of iron from the stamps, so that the yield computed from the weight of the brick is far below the actual result, which, allowing for the loss aa stated, would he at least $45 per ton—a result that we confidently anticipate on the next test, when, by reason of the pans being already coated, a similar loss will not he sustained. We make this estimate upon the same character of rock as that from which the first test was mnde, and desire to here place upon record the prediction that rock taken directly from the vein will show a yield twice as large as that already ahown.

A test will next be made of rock from the Scranton and Superior mines, and we confidently anticipate a mnch more favorable result, for the reason that the ore was more carefully miued, and has not been culled over and robbed of its richest specimens as was the case with the Ontonagon. We hope to receive the result of the test of the Scranton vein before going to press with this issue.

Altogether, we think that the first test proves conclusively the very great value of the Iron river silver vein or veins, subject only to the contingency of their extent and durability. On this noint, the developments nt the Scranton mine wonld seem to put at rest all fears. Where the vein outcrops in the river it carries a width or thickness of only fiftaen inches; at n depth of 300 feet, reached by sinking a perpendicular shaft at a point 250 feet in the rear of the outcrop, it is found to widen out to the width of over three feet. The same is also trne of the Ontonagou, which are the only two points at which the vein has been opened to any considerahle depth. These facts would seem to warrant the conclusion that the veiu is uot only durable, but that it will be fonnd to increase in siza the deeper it is worked, as it certainly has been found to grow richer in the percentage of silver.

Tar and Oil for Furnaces.

The Indianapolis *Sentinel* has the following: For more than a year past, Mr. Henry Staoy has been endeavoring to perfect plans by which coal tar, crude oil, etc., could be practically utilized for the purpose of making heat enough to melt iron (of all descriptions), brass, generate steam, etc. * * * The gas company have had these heaters on their furnacea for nearly six months, and so well have they done the work that during this time the company have saved daily, on ten furnaces, six hundred bushels of coke, and in making this saving have consumed a portion of coal tar that would otherwise have rnn into Pogue's run. One of these heaters was placed on a furnace at the Malleable iron works last week, where it reqnired eight days and nights to anneal the iron with coal, but the heater did the work better in six days and nights, consuming but two and a half harrels of tar, costing $1.50 per barrel. Mr. Stacy thinks he can run a locomotive a distance of 100 miles without a fireman, at a cost of but 50 cents. Arrangementa have beeu made, already, for the speedy introduction of this great invention, and, as the men interested have means and ability, there seems to be no reason why it will not be adopted by all those needing furnace heaters at a saving of abont ninety per cent. over wood or coal. The cost of the heater is not to exceed two dollars for each furnace, and it is so simple in its construction that a child can easily understand its operation. The tar, oil, etc., passes from the barrel, tnnk, or reservoir through a small pipe, and is deposited in front of a steam and cold air injector that forces it into the furnace in form of spray, making a perfect mass of flame, but no smoke nor sparks.

[Thia method of injecting crnde oil into a furnace is the aame as that invented by a Californian about two years ago.]

Sunflower for Fuel. — In the Weatern States a good deal of corn is nsed to make fires, and it is proposed to grow sunflowera for this purpose inatead. A carefully grown sunflower will stand ten or twelve feet high, and have half a dozen good heavy blossoms. These blossoms are great favoritea with bees, who get from them a good supply of honey. The aeeds when crushed furnish a very clear and pure oil, and in their natural state are the chosen food of domestic poultry. Above all, the very substantial stalk and branchea, and leavea, if put away under cover, will make admirable fuel for kindling even the hardest of American coal, or even for hurning by itself. Thus honey, fat poultry, eggs, oil and fuel are the chief recommendations of the sunflower. Having all these substantial qnalities, she can afford to part with the fiction that makes her "turn to her god when he aets the same look that ahe gave when he rose." Constancy ia a virtue, of conrse, bnt in the sunflower the American looks rather for a tall stem and a good head-full of oil.

A Venerable War Ship.

The frigate *Constitution*, or "*Old Ironsides*," as she has been familiarly called, after having lain on the stocks at the Philadelphia navy yard for several years a dismantled and apparently rotten hulk, has, at last, by apecial order from the Navy Department, been placed in the hands of the carpenters, and is now undergoing repairs, with a view, it is aaid, of being exhibited during the Centennial year. There is nothing remaining of the vessel except the bare hull, and workmen are now engaged in erecting the necessary stagging in order to begin the work of replanking her ribs. After she has been got in a condition for the water, she will be launched, and the rest of the fitting up will be done after she is in the water. It is the intention of the government to have the original appearance of the vessel, both inside and outaide, reprodnced as nearly as possible. The hull is already coppered, and it is thought that the remaining ropairs can be completed in a comparatively short time.

Considerable interest will be doubtless felt by the public in the question as to whether any of the original timbers laid in the vessel when she was constructed iu 1797 remain. There is a tradition among naval constructors that there are some of the original timbers now in the vessel, but there have been so many repairs to her, and she has been so frequently overhauled that it is almost impossible to ascertain definitely whether such is the fact or not.

The vessel is said to have suffered greatly at the hands of relic hunters, for it is asserted while she was undergoing repairs at various wharves it was no uncommon thing for a carpenter who had discovered a piece of old and "historic-looking" timber, to appropriate it and have it turned into a cane or some other article to he preserved by himself or friends as a relic. These depredations, together with the necessary removal of a large amount of decayed or insecnre timber, has almost transformed the vessel into a new ship.

It was proposed by the naval authorities when it was found on the adjournment of the last Congress that no special appropriation for her repair had been made, to break her up, as it did not appear that she would be of any forther use to the navy. A similar proposition was made once hefore, and was the cause of the well known poem, written in protest of the act hy Oliver Wendell Holmes, beginning with

"Ay, tear her tattered ensign down."

The *Constitution* was built at a cost of over $300,000 at Hart's shipyard, in Boston, and was launched on the 21st of October, 1797, in the presence of a vast concourse of people. Special care was taken in her construction to use the best live oak timber, and the bending of the planking was done without steam in order that it might be the harder and more durable.

Her first commander was Captain James Nicholson, and she started npon her first cruise in July, 1798. In 1804, she was the flagship of Commodore Preble during the bombardment of Tripoli, and in the action of the 29th of August before Tripoli. She was run to within a short distance of the fortifications, and after a fierce contost silenced the gnns.

On the 19th of August, 1812, the celebrated combat between the *Constitution*, carrying forty-four guns, and commanded by Captain Isaac Hull, and the British frigate *Guerriere*, carrying thirty-eight guns, and commanded by Captain Dacres, took place off the American coast, in the present track of the vessels from New York to Liverpool. After considerable manœuvering, the vessels came together late in the afternoon, and the rigging of the two vessels having become entangled both crews prepared to board. While Lieut. Morris, of the *Constitution*, was making an effort to lash the vessels together, the *Constitution* shot ahead of her antagonist, and it was then found that the *Guerriere* was badly shattered. Soon after, the foremast and mainmast of the *Guerriere* were carried overboard, and the vessel was left helpless. A few momenta after, her commander surrendered.

The next action in which the *Constitution* was engaged was an engagement with the British frigate *Java*, of thirty-eight guns, commanded by Captain Lambert. This action took place on the 29th of December, 1812, off the coast of Brazil, and laated for three hours. A large number of the guns of the *Java* were disabled, her masts were shot away and her hull was badly damaged. The *Constitution*, on the other hand, was scarcely damaged at all. Of the crew of the *Java*, numbering 400, twenty-two were killed and 102 wounded. Her commander was among those mortally wounded. The loss on the *Constitution* was only nine killed and twenty-five wounded.

On the 20th of February, 1814, while on her way from Bermuda to Madeira, the *Constitution*, commanded by Captain Charles Stewart, fell in with the British vessels *Cyane*, thirty-six guns, and *Levant*, twenty guns. After an engagement lasting not quite two hours the *Cyane* surrendered, and two hours later the *Levant*, which had endeavored to escape, having been overtaken, was also compelled to surrender.

Of late years the *Constitution* has been used as a school ship at the Naval Academy, at Annapolis, and for a long time, while lying at the foot of the "long wharf," she has been a familiar object at the Academy. The figure-head of the *Constitution* has been for a number of years a wooden statue of General Jackson, which it is proposed to place in the grounds of the Naval Academy at Annapolis,

SCIENTIFIC PROGRESS.

Prospects of Science on the Pacific Slope.

The conditions for the advancement of science beyond the Rocky mountains are peculisrly favorable. The country itself presents an exhaustless field of research in every department of the physical and vital history of the world. Its records of contiuental upheaval and subsidenee, of nacient rivers and vanished seas, of vast volcanio outpourings, and vaster scenes of erosiou, are wonderfully full and legible. In the beds of its tertiary lakes are the remains of multitudes of the progenitors of recent forms of animal and vegetable life—inexhaustible mines of material for the solution of the great problems of evolution. On the shores of those lakes and rivers dwelt the most ancient races of men that geology has fnrnished glimpses of. Already abnndant trsces of them have been discovered in and beueath the later tertiary strata, and it is not unressonable to hope that future observation may connect them with the post-glacial founders of the civilizations which grew np along the valley of the Colorado, before that strange river had sunk its chsnoel a mile below the surface of the plain it once watered, probably before the Nile spresd its first layer of fertile soil over the fonndation sands of ancient Egypt. Chemical geology has already been immeusely fnrthered by the knowledge gsined through the mining operations of the interior and the investigations they have inspired; while the demsnds for men ot scientific training, incident to a country so largely givsn to mining, have secured to the Pacifie slope a proportion of scientific observers nneqnaled in any other conutry.

In older commuuities, science aud scientific thinking have to contend with the conservatism of enstom and the traditione of scholastic culture; in the far West, where scientifio training has been at a preminm from the first, where public prosperity rests so largely on scieutific operations, science is likely to get more thsn its fair shsre of encouragement, rsther than less.

In proof of this, it is necessry only to contrast the financial condition of the Califoruia Academy of Sciences with that of our Eastern societies of like ohsracter. It is true that something more than money ie needed for productive investigstion; the natursl and socisl conditions must be favorable, and there must he no lsck of msn of proper zesl aud training to nndertake the work. In this reepect, as already noted, the Pacific slope is as greatly favored ss in its sbundsnoe of wealtb; and only the grossest mismsnagement of their mesns and opportnnities can prevent the richest harvest of scientific achievement by the Pacific scientists, whether independent or connected with the Californis Academy.

The magoificent scope and execution of Mr. Bancroft's research, in connection with the native rsces of the Pacific coaet, afford st once an illustration of the Western wsy of working, snd a model of thorough scientific investigation. Wo shall be greatly disappointed if Mr. Bancroft's work does not prove to be the first of s long series of correspondingly valusble researches in other departmente of knowledge, undertsken by the scientific workers of the West. Hitherto their work has of neceseity been chiefly of practical, money-making sort. It hss given them the best poseible training for the conduct of investigstione of brosder scope and remoter profit. The work lies ready at hand; and it is ssfe to predict its prosecution with true Western vigor aud thoroughuess.—*Scientific American.*

New Applioations of Paraffine.—The corks of jars holding corroeive acid msy, it is said, be rendered proof agsinst the corrosive action both of liquids and gases, by dippiug them in psrsffine, and afterward drying at a temperature of 100° C. The eame method may be pursned with wooden vessels of sll kiuds used in manipulating powerful scids. Dr. Bohl observes that psraffine ie likely to sttsin a considerable importsnce in the manufacture of glazed papers of all kinds. For white snd delicate colored papers, 24 parts by weight of parsffine are mixed with 100 psrts of china-clay; the componnd is dried, snd ground with cold wster, snd mixed with the pulp in the proportion of 4 to 6 per cent. Paper thus prepared takes a fine sstiny gloes, and resists the damp well.

Chemioal Filter.—Place inside of the glaes funnel a small filter of parchment paper, pierced at the bottom with a fine needle; afterwarda plsce the ordinary filter in the funnel, and filter as uenal. Snch cones of parchment paper can be nsed in any required size, are essily obtained, and may be applied to almost all purposes where the more expeusive platinum cones have hitherto been used.

Chloroform, added to crude petroleum when burning, will at once extinguish it. According to F. M. Ommegauck, of Autwerp, five per cent., or one-twentieth part, will most readily effect this result. Even one-sixtieth psrt msy be made to extinguish the oil when burning.

Rate of Growth of Coraal.—According to Prof. Le Conte, the rate of the growth of corals in the Gulf of Mexico, is from three and one-fourth to fnnr inches per annum.

Industrial and Medical Application of Salicylic Acid.

This new product continues to be the subject of experiment, and numerous applications of its wonderful preserving power has already been made. It is excellently adapted for preserving eggs, fresh meat, jams, hevsrages, drugs, dye extracts, etc. Professor Neugebsuer recommends its use in wiue-making, snd in the trestment of ths various affections of fermeutative nrigin to which wines are subject.

Professor Kolbo recommends it in the nanufacture of effervesoing wines, export beers, etc. Fresh water on shipboard may be kept sweet by a mixture of the scid in a proportiou not exceeding one part of acid to 20,000 of wster. Or the water may bo filtered, as required for nso, through cotton wool dipped in a solution of the acid. Meat may be kopt fresh for wscks by rubbing it over with the acid, the lstter being washed off when the moat is required for nse. Now milk containing .04 per cent. of the acid, when left uncovered for thirty-six hours, was fonnd in better condition than an eqnal quantity of the same milk without any admixture, which stood beside it.

Salicylio acid may be nsed as tooth-powder, or, mixed with warm water, as a mouth wash. Sprinkled over the feet, it ie an effeetnal remedy for offensive odors arising from the perspiration. Applied as a powder with talc, sosp, and starch, it rendere the feet white and firm, and is a good sutidote to sore feet, well adapted for the nse of travelers snd soldiers on the march. Mixed with powdered starch, it may be advantsgeously spplied to sores and outsneous eruptions. A mixtnre of one part of sslioylic acid, three psrts phosphate of sods, nnd fifty of water, forms a good wssh for promoting the granulntion of wounds. In operatious iuvolving much loss of blood, Professor Thiersch employs s solution of one part of the scid in 300 of wster, to spriukle the injured surfsces sud to steep the bandages.

Dr. Febling states thst, at Leipsio, salicylic scid is now univorssily employed as a substitute for c rbolic aoid in msternity prsctice. In disinfecting the hands, clothes, etc., in cases of puerperal disordere, it is used either mixed with wster in the proportious 1 to 300 or 1 to 900, or ss a powder mixed with smyl in the proportion 1 to 5.

Sslycilic acid is soluble also in fatty oils, and may, therefore, replace carbolic acid in the preparation of Lister's bsndages. Its internal nse in cases of diphtheria, scarlatens, measles, smsll-pox, syphilis, cholera, etc, has yet to form the subject of experiment. Professor Kolbe finde that daily dosee of 1.0 to 1.25 grammes of salicylic acid in a crude stste is not to be recommended, on account of its irritating effect on the month snd throst. It msy, however, be given ss a syrnp.

The Spider's Web.

In onr issue of July 17th, we gave a little query from *Science Gossip*, under the head of "How Does the Spider Make His Web?" A correspondent of the *Scientific American*, which also gave the same item, snswers se follows:

"How does a spider make its web, the linee—some of them—crossing at the center, are csrried to the surrounding objects, while others sre fastened to an outer cironlar line, made evidently before the onter circular linee of the woof are formed?" Aleo: "Where does the spider plsce itself when it ejects the lines which form the spokee of the wheel?"

The extreme outer line surrounding the web, to which the spokee are fsetened, is by no mesns alwsys circular; this depends upon the position of the surrounding objects to which the web is faetened. The epider first extends lines from one point to another by the shortest route possible, inclosing a enfficient spsce to build its web; then he extende a line acrose where he intends to hsve the center of his web. He next fixes the center by fsetening a line thereto on the centrsl line, and, csrrying the line at right angles or nesrly so to the first line, hitchee it to the nearest object, whether that be the outer line of the web, or snything to which the web is fastened. It will be observed here thst the spider ejects all the epokes of the wheel (except the first line across the center of the web) from the intended center, placing the first lines at right anglee or nearly so, and dividing the dietsnce eacb time a line ie extended from the center until a sufficient number are put up, always stretebing the lines alternately in opposite directions until the spokes of the wheel are complete. He then places his left forefoot on the center of the wheel, and bitches the first end of the circular line of the woof to one of the epokes of the wheel, and moves rond the center, fastening his thread to every spoke as he go.s along, measuring the distance from one line to the other by stretching his right hind oot to secure the web to the spoke, with his le.t fore to.t one line toward the center and moving spirally aloug from one spoke to the other, until he gets his web sufficiently large for his purpose.

Poison in the Soil.—Cut from the earth a cubic foot of gravely soil and you will find you can pour into it one-third of its bulk of water. This really shows thst the water occupies one-third of the bulk, and when the water draine off an equal smount of air takes its place. Now the air of the soil is filed with various gases, such ss sre generated from animal mat er. The amount of carbonic acid in ground soil lately manured, is many times what it is in the air. The soil, however, can hold these gases for plants, so that they rarely injure us.

MECHANICAL PROGRESS.

Peter Cooper's First American Locomotive

"On a recent trip down the bay of New York," says the editor of the Brooklyn *Union*, "we turned with the venerable Peter Cooper a page of the opening railway era of America." Mr. Cooper, he claims, deserves the honor, among the other honors of his usetul life, of being tho first to introduce into actnal service the railway engine in America. We condense from the very animsted and interesting sketch of Mr. Cooper's reminisconces:

"Think of the excitement that pervaded the civilized world when it was sottled thst the Darlingtou rsilway, which was opened to supply London with coal, hsd actnally begun to carry passengers by steam at seven miles per hour. But we are able to correct the reminiscences of thst occasion which shared the common mistake that the snocess of the Liverpool & Manchester railway stimulated the introduotiou of railroads into this country; for some of the now most importsnt roads in this country were projected and commenced before the Liverpool & Mnnchester was bnilt. It received with them the stimulus of the first rosd above nsmed. In 1828, Mr. Cooper was in business in New York, his nstive place. His mother and grsudmother were both born on the present site of St. Paul's chnrch, Vesey street aud Broadway, and his mother remembered seeing the stockade still standing which hsd been erected to keep the Indians out of infant Now Amsterdam. Mr. Cooper had bought as a speculation the entire magnificent tract in Baltimore now owned by the Canton company. Baltimore was then a city of 75,000 people, rich and prosperous, and hsd entered upon the railroad era. On July 4th, 1828, the corner-stone of the Baltimore & Ohio road wse laid with imposing ceremonies by Charles Carroll, of Carrolton. It was pushed energetiosily, a little too mnch so, for when thirteen miles hsd been finished it wss found that in tnrning the rocks to ssve cutting, such short curves had been introdnced that the then experts declared the line utterly useless. It could not be nsed by steam. Five per cent. hsd been psid in, and shares hsd been sold at 17, such wss the zesl and confidence of the people. But the ohill was immense, and everything stopped. Mr. Cooper, then thirty-eight years of age, saw new disaster to himself in the depreciation of his trsct shonld the road fail. He proposed to the Directors to constrnct an engine that should be available to their line. They were willing, bnt incredulous. He brought down from his glue fsctory in New York sn engine with three snd a hslf inches cylinder and fourteen inches stroke, procured wheele and other spplisnces from the railway company, and presently rolled ont upon the trsck the first American rsilway engine. The trial trip was to take place the next day. Thst night a thief stole all the copper snd brass from the infant machine snd caused some further delay. The trisl trip wse run, Mr. Cooper himself nctiug as engineer; and when his wheezing little baby locomotive threatened to lose too much steam he held down the safety vslve with his own hsnds. The run was made with thirty passengere, thirteen miles in one hour, and Baltimore wss happy. Compare the little eugine of forty-seven yesrs sgo with the ponderous mschines of to-day, and yet they follow on the pathway the little engine opened."

European Demands for American Engineering Instruments. — Meesrs. Hiller & Brightly, the mathemstical instrument makers of Philadelphia, hsve recently received, and are now filting, heavy ordere for engineering instruments (tranoits and levele) from Vienns, Austria, and from Bristol, England. When it is recslled to mind thst up to within s comparatively recent date all the most accurate instruments of this class have been imported from Europe, and thst this is the first instance known where instrumeuts of this olsss hnve been imported into Austria from thie conntry, the fact is deemed worthy of notice. This firm is also filling ordere for engineers' transits and levele, etc., for the Imperial College (Ksga Yashiki), Tokio, Jspan, from Yokohama and Kokaido, Japan, and from Hong Koog, China. They have aleo recently shipped a number of their instrumeuts to South Americs.

The Monster Gun at Woolwioh.—The 81-ton gun in course of manufscture at the Royal gun factories in the Roysl Arsensl, Woolwich, is rapidly spproaching completion. The bore is being rifled at the boring mills in the department, and the only other process required to finish the gun in the rough is the shrinking on of the trnnnion ring. Considering that the 81-ton gun is more than twice the size of any other gun yet made at Woolwich, aud that most of the machinery by whicb it hss been produced wae never intended for such gigantic operations, it is worthy of remark that the work hss been performed without the slightest hitch or accideut to the gnn. The face of the new 40-ton hammer wae frsctured in welding together the breech coile, bnt thie wae soon remedied by substituting another face piece msde in the department.

The Largest Rifled Cannon.—They have just finished, at South Boston, the largest breech-loading rifled cannon in the world. It is steel lined, weighs 82,280 pounds, is 12 inches calibre, carries a 600-pound shot, snd reqnires a charge of 70 pounds of powder. It ie destined for Ssndy Hook.

Headwork an Aid to Handiwork.

The pursuit of mechanice involves accnracy of eye, knowledge of form and of proportion, strict measurements, and a dne preservatiou of the relatiou of parts to each other, and of the whole to the several parts. It teaches also economy of material and of space. Strength and ntility msy, indeed, be acquired without observation of all these details. Tho old fashioned iron and other metal work of houses, csrriages, and ngricultural snd other implements, and the waste of wood, stone, brick and other materials, show that the workers for our grandpareuts consulted safety and durability without much regard to taste or elegance. The work in an old-fashioned chsir would almost make a full set of modern ones. A Lsncaster lock-handle was long enongh to set as a lever to lift a hundred weight. Competitiou making economy necessary and reqniring elegance and fitness in ordor to secnre purchasers, has changed the style both of honses sud furnitare. And a better comprehension of the strength of materials has csused modern machinery to attain what ancient machinery lacked, thst is symmetry sud even elegance as well as strength. If an iron worker of the lsst century had undertaken to construct a locomotive, for instance, it would have been a clumsy and ugly affair. Now the psrts are proportioned exsctly to the power required, snd the details are worked up with an eye of beauty. A trsin of highly finished cars, drawn by a first-class locomotive, is a triumph of strength, beauty and mechsnical ingenuity.

A Mechanical Car Starter.

George Hunter, of Payson, Ill., has invented a device for the above named purpose, which is described ae follows: To the inner side of one of the wheels is rigidly attached a small gear wheel, and to the inner side of the other wheel is attachod a large, internally toothed gear wheel. A shsft placed parallel with the axle is msde in three parts, connected with each other by universsl joints. To the middle part of the shaft is attsched one end of the spring, which is coiled around said shsft. The end parts of the jointed shaft engage by gesrs with the gear wheels above mentioned. Devices are provided which lock the levers, which hold the gear wheels in gear snd ont of gear. When the car is to be stopped, the apparatus is so regnlated thst the torward movement or momentum of the car may wind np a spring. When the car is to be started, the power of the spring may be spplied to the wheel near its rim, and thns, with a great advantage of leverage, assist in stsrting the csr. In the eame way the spring msy be coiled by the advance of the car when upon a level or down grade, and held, to be applied to the car when upon a short upward grsde, to assist in its propnlsion

---

New Mone of Linino Metallic Tubes with Another Metal.—A vslusble method of lining a tube of one kind of metal with another of a more fusible nature is noticed in the London papers. It conoists in first thoroughly cleaning the interior of the tube and plugging it up st both eude, and then fitting it into a lsthe or other apparatus, by mesns of which s very rapid rotary motion in a horizontal position msy be given to it. Through one of the pluge a sufficient quantity of the second or softer metsl, which ie to form the desired lining, is introduced in a melted state; a psn of ignited cosls or a gss-burning sppsratus being plsced nnder the tuhe, extending slong ite whole length and st a suitable distsnce, so ss to keep the metsl in that condition while a rotsry motion of the tube is estsblished. The melted metal is thus diffused uniformly around the interior of the tuhe, and, by removing the coale while the rotation is still continued, the temperature is gradually reduced, and the interior metsl hardens, forming s permanent liniug.

A Million Dollar Hammer.—A German psper informs us that the fsmous steel works of Frederick Krupp, of Eesen, are about to receive a very important addition to their mschinery. The largeet steam hsmmer in use at these works, at the present time, is one capsble of workiug a mass of steel fifty tone in weight, snd erected st the cost of $560,000. It is now in coutemplation to huild a new stesm hammer capable of beating np a mass of steel of double the weight, namely, 100 tons. The new machine, it is estimated, will cost $1,000,000 and will be the most powerful in the world; and it may be expected that the sizo and weight of the German artillery will be enormously increased, ae the new stesm hammer will permit the working-up of larger mssees of metal than, up to the present time, has been thonght to he possible by scientific engineers.

Enormous Locomotive Engines.—A locomotive has recently been plsced on the Pennsylvania railrosd which weighs seven tons heavier than the ponderoue "Modoc," whose drawing capacity is almost twice that of an ordinary locomotive. Tho "Modoc" is capable of taking eighty loaded cars from Harrisbnrg to Columbia, while other engines are put to severe test when they pull fifty csrs on that portion of the road. The new locomotive, when full intiated, ie expected to get away with a hundred cars. The only argument that can be ueed sgainet large engines is that they are hard on the tracke, but as the Penneylvania railrosd company hss adopted eteel rails—able to withstsnd a fsr greater pressure than iron rsils—the wear will not be meterial. The introduction of these mammoth engines is considered a very economical measure by the railrosd company.

The Mining Share Market.

Since our lest iseus the market has undergone soms changee. The last part of the week and np to Tuesdey it was steady, bnt that day showed a weaknese and yasterday (Wedneeday) the etrannoue efforte of the heers effected a material decline in eome of the leading etocks. Ophir closed on Monday at $66; Tueedey it had advanced to $74¾ and Wedneedey dsclined to $68½. This morning it was down to $67. The hear element is making a strong fight, bnt it ie believed that any succes they may have will be only temporary and that the increased activity in stock circles, together with enconragning rsporte from the minee, cannot hut result in a strong and steadily advancing market.

The regular monthly dividend of $10 per ehare ie being paid by the Coneolidated Virginia. The Directore of the Northern Belle have declared their third dividend of $1 per ehare and the Gila silver mining company has declared a dividend of twenty-five cente per share.

Reports from the Comstock continue to be of the moet enconreging character and those heet acqnainted with the resources of that wonderful lode have unhennded faith in the future, and believe that the world has not begun to see the houndleee wealth contained in ite depths.

CONTRACTS for grading the North Pacific Coast railroad from Tomalee to Duncan's mills have been let, and the entire work ie to be completed by the 1st of May next. The tunnel at Tomales, npon which a large force ie at work, will be 1,800 feet long. It ie believed that it will be quite eaey of conetruction.

SAN FRANCISCO, August 11, 3 P. M.

MINING SUMMARY.

THE following is mostly condensed from journals published in the interior, in proximity to the mines mentioned

California.

ALAMEDA.

THE LIVERMORE COAL MINE.—The Alameda *Independent*, of August 7th, publishes a communication from Rev. J. J. Powell, giving an account of a visit to this mine from which we extract: About the first of January of this year the company began operations at their present location. There were surface indications which led Mr. Thomas Harrie, the efficient Superintendent of the mines, to believe that there was a rich deposit of coal in the neighborhood, and they soon struck a black seam, which they followed for 60 ft at which depth coal began to show itself, and as further depth was attained upon the deposit, they found a first-class vein 5 ft thick, or about one foot thicker than the Black Diamond vein. Angle 41 degrees north, and well defined to a depth of 400 ft. It is lignite, similar in quality to the Black Diamond, but of a higher grade and far superior as far as it has been tested. The tests are so far exceedingly satisfactory, much freer from smoke and obnoxious sulphur than the ordinary lignite. The company are hueily engaged in making arrangements for shipping coal on a large scale. They have on the ground and are putting up a large and powerful engine, with two large boilers. The whole will be constructed with a view to permanent and extensive operations, and will be provided, when complete, with the auxiliaries of blacksmith, carpenter and general repair shop. They are also engaged in building a hunker—capacity 250 tons.

AMADOR.

PROSPECTING IN THE EUREKA.—*Foothill Ensign*, August 6: We believe it is the intention of the Superintendent to do a little prospecting on this mine. Sinking operations are to be commenced forthwith, and the shaft run down 200 or 250 ft, in the hope of again striking the ledge. This work will require many months to complete, and in the mean time the mill will only be run to about half its capacity. For so extensive a mine comparatively little prospecting has been done, and it is confidently expected that a small expenditure of capital in this way will develop chimneys of as rich a character as have ever been met with in the past history of the mine.

BUTTE.

FIRE AT THE LAVA BEDS.—*Record*, Aug. 7: A fire occurred at the Lava Bed mines, near Oroville, on the morning of August 1st, which destroyed the Chinatown of that locality, consisting of about 60 new buildings. The loss is estimated at $60,000.

CALAVERAS.

A STRIKE.—*Citizen*, Aug. 7: We learn from Mr. Brice that Booth and Rhead have struck a rich quartz vein near Angels. The rock is reported to be so full of gold as to necessitate a chisel being used to separate it.

FIRE AT THE SAN BRUNO.—*Chronicle*, Aug. 7: Saturday evening last the blacksmith's shop, sheds and other buildings connected with the San Bruno mine at Mosquito, were destroyed by fire. A lot of wood was also consumed, and it was only by hard work that the fire was kept out of the "dump." Operations at the mine were not impeded by the fire.

A RECENT clean-up at the Veth hydraulic, after a few days' run, yielded $2,500. Pretty good considering that only a partial clean-up was made. Operations in the mine have been suspended for want of water.

PIPING has ceased in all the hydraulic claims in this vicinity owing to the scarcity of water. The supply in the ditch is unusually small for the season of the year.

EL DORADO.

MINING ITEM.—*Mountain Democrat*, Aug. 7: Under date of Aug. 1st, "Prospector" writes as follows from Greenwood: The ditch company having completed the ditch to Loon lake, we are looking for lively times.

THE French claim commenced operations today, and having had the claim put in splendid condition, will no doubt give a good return in due season.

THE Taylor mine is again in operation, good ventilation having been secured. It is being worked by single hand drilling, and the superintendent reports a great saving in expense in consequence. A rock breaker is in course of erection at this mine.

THE Rosekranz mine—the first south extension of the Taylor—is being opened—and the ore is looking and will pay as well as any in the State. Mr. Burlingham has a 5-stamp mill which will commence crushing ore the first of this week, having about 100 tons of ore on the dump. Four miners will keep the mill going, the ledge being 4 ft in thickness between the walls. The shaft 15 ft by 4½ inside the timbers.

THERE are several new buildings in course of erection, besides those lately completed, which shows that our miners have confidence in the permanence of the mines at this place.

MESSRS. WILLIS AND CRANE are sinking on a ledge near the Rosekranz mine, with flattering prospects for a fine development.

INYO.

THE JACOB'S MILL.—Panamint *News*, Aug. 4: It is rumored that E. P. Rains and others have leased, for one year, the Jacob's mill, down the canon, the first one built in Panamint. If this is so, we presume the intention will be to put in a roasting furnace, and run it on custom ore. We hope this is a fact, as it will give a number of our miners an opportunity of prospecting their ledges. Mr. Rains is expected here in a few days, when we shall endeavor to learn particulars.

THE Stetefeldt furnace at the S. V. M. & W. company's mill was fired up last Saturday evening. A slow fire will be kept up for about 10 days in order to thoroughly dry and temper the masonry work, after which time, the mill will commence to run. We think we shall hear the sound of the stamps about Tuesday or Wednesday of next week. The Hallidie rope-way, for bringing the ores down from the Wyoming and Hemlock mines, is completed, and works to a charm. In the mill but a few things of minor importance remain to be done—the laying of one or two short railroad tracks and some paving of the ground floor with brick. Nearly everybody were engaged yesterday in cleaning away the debris of the workmen, preparatory to active operations.

MARIPOSA.

RIVER TUNNEL.—*Gazette*, August 7: Our advice from Bear valley inform us that this tunnel is now one thousand and twenty feet in length, with the face in hornblendic rock, and extremely difficult to break. Last week it required twelve hours to drill a dozen holes about four feet each in depth, and these holes were fired three times in order to blast to the bottom of them. But in all probability this ground will not continue, and the rock will become easier to extract. The water still comes in at the heading. A new road has been made lately, so that material for the work can be unloaded on the dump; which, at the present writing, has grown to be quite large and roomy. The time occupied in going in and out with cars pushed by men, is so great that mules will be put to do the work, one mule hauling three or four cars.

NEVADA.

WORK AT THE GOLD TUNNEL MINE.—*Transcript*, August 7: For some time past Mr. Holland, the superintendent, has been engaged in sinking a new incline shaft to work and develop the north end of Gold Tunnel mine. The incline when completed will be over 600 ft in length, and was started from the surface and present lower level at the same time. When sunk 260 ft water was encountered, and the sinking from the top suspended, and the work prosecuted by raising from the bottom alone. There is in the mine a middle and upper level, and to facilitate work, Mr. Holland had a connection made between the middle level and the raise in the new incline. The connection was made on the morning of the 22d of July, at a distance of 153 ft from the bottom of the new incline shaft, and with an accuracy that is worthy of mention. There are forty-one different horizontal angles or corners, distances, five vertical angles, sixteen different leveling sittings in the lower, and nineteen in the middle level, making no less than 81 instrument sittings and readings, and the whole distance to connect is 1,575 ft—255 ft over a quarter of a mile—when, as the miners term it, they "holed." The connection was perfect; the exact point in the new incline was hit; the leveling came together like a floor, and the distance to the inch. The engineering has been done by one of the pioneers of this county, Capt. C. H. Seymour.

PLACER.

MINE CLOSED.—*Argus*, August 7: The mines of Gold Run, with the exception of the cement mill, are all closed on account of a scarcity of water. The town does not present its usual lively appearance. Work in the way of tunneling and preparing for active operations as soon as they get water still continues.

THE ST. PATRICK.—*Herald*, August 7: The most favorable reports come to us from this mine, or rather from the Crater mine, which belongs to the St. Patrick company. "It is," an old and experienced miner tells me, "one of the best mines in the State, and if located in some district that had a reputation, would be worth a million of dollars." How this may be we don't known, but we learn that they are hoisting daily about 20 tons of ore, which pays in the neighborhood of $50 per ton. The mill is kept running all the time, and the late clean-ups, as a natural consequence of such rock, have been of a character decidedly encouraging.

THE Greene mine is now yielding some very rich rock. They are now stoping from above the 240-ft level, where the ledge is three ft thick, and the character of the rock superior to any yet taken out since the mine was re-opened. This mine, throughout, looks decidedly better than it has ever done. The pay chute is broad, and the rock is so rich as to show free gold plainly in nearly all. Some changes are just now being made in the mill, which, though, will be completed early next week, when they will again commence crushing, and from the rock now out, they will make, doubtless, the richest clean-up ever made in the district.

THOS. WADE, while employed by John Worsley in cleaning out the old channel of Auburn ravine, beneath Cubberly's wagon shop on Washington street, for the purpose of erecting new underpinning for the same, discovered that the gravel contained gold. He accordingly put in two sluice boxes, dammed the water so as to run it through them, and what dirt he was compelled to move he threw in the sluice boxes. By this means he has saved, we understand, much more than wages in dust, besides finding several specimens, the largest of which is worth about $7.

SAN DIEGO.

DEVELOPMENTS IN THE NEW MINING DISTRICT.—*Union*, August 4: A correspondent of the *Union*, writing from Julian, says a letter has just been received from Mr. H. M. Whitcom, (now on a visit to San Francisco), to whom the superintendent of the Oriflamma mine sent a package of sulphurets taken from the first run of rocks to have tested by working process. Mr. Shulz, of Frary & Shulz, who received the letter, has permitted a copy of it to be given to the readers of the *Union*. Mr. Whitcom writes: "I have had one test made of the sulphurets that Mr. McLellan sent to me. One ounce was tested just as he sent it, and it yielded at the rate of $758 to the ton! I have worked the balance down much finer and it is being tested now; I expect from it much better results." The sulphurets spoken of were taken from the concentrators on the first part of the first run of the Oriflamme mill, and from the *poorest* quality of ore the mine produced, which was being put through simply as a test of the mill, and to fill up the battery floors, etc., before putting through good rock.

SHASTA.

THE MCCLOUD RIVER MINE.—Yreka *Union*, August 7th: Last Thursday, Mr. F. Grisez, of Little Shasta, showed us a certificate of assay of some rock from the new discoveries on McCloud river, by Leopold Kuh, San Francisco. The rock from which the assay was made was sent down by Frank Montre, Mr. Grisez's partner, who is at present at the mines. The piece of rock assayed was from a well developed ledge, about 4 ft wide and about 20 ft from the original discovery and running parallel with it. The certificate is as follows:

Oza., 1.59 gold, value per ton	$32.87
" 3.05 silver, value per ton	3.96
Total value per ton	$36.83

This would indicate that these mines are of considerable value, notwithstanding the unfavorable reports brought in by most all who have visited the locality. Mr. Grisez informs us that no work has been done on this ledge yet, Mr. Montre having broke the piece of rock assayed off the ledge with his pick, just before he started for Yreka. A tunnel is being run on the original discovery, in which Mr. Montre is also interested.

SIERRA.

PRESERVED WOOD.—A piece of wood from the Buena Vista mine, at Monte Christo, has been taken out 50 ft below the surface. It has been there undoubtedly for thousands of years, as trees have been cut from the surface 4 ft in diameter. The feature peculiar to this specimen is that the fibre of the wood is so well preserved, being nearly as strong as when first deposited, whereas wood found deep in the hills is generally charred and rotten.

SISKIYOU.

THE SCOTT RIVER DITCH.—Yreka *Union*, August 9: From the parties from Scott river we learn that the work on the ditch now being constructed on Scott river by the San Jose mill, mining and ditch company, is progressing favorably. About one mile and a half of the ditch is now completed, with the exception of a little fluming. The ditch lines are already permanently run for over eleven miles. The mill was started up for the first time two or three weeks ago. It was started up again last week but had to stop on account of the breaking of the mill gate. It is expected that it is running again by this time. We are informed also that another contract for digging has been let on the ditch, commencing at Tonkine creek—about the middle of the ditch. The contractors are Chinamen. The size of the ditch at this point is 5½ ft wide at the bottom, 3 ft deep, and 8½ ft wide at the top. The work will be pushed forward with energy until the ditch is completed. The company have a claim about 1½ miles from the head of the ditch which they intend to commence prospecting as soon as they can get the water to it. They have a little giant and 400 ft of pipe already on the ground. We are informed that there has not been any mining done as far up as this claim before, though good prospects have been got all around there. The ditch company have other claims on the line of their ditch, and propose, we believe, to prospect the ground all along the ditch.

SONOMA.

IN FULL BLAST.—*Democrat*, August 7: The new furnace of the Cloverdale mine is working well and is now in full blast. They have a large amount of ore on the dump, and we understand that the owners are well satisfied with the prospect so far. On the Mount Vernon, next adjoining, the prospect is also very flattering. W. S. Bell, one of the owners, will set to work at once to build a furnace.

A CLEAN-UP.—Russian River *Flag*, August 5: The Great Eastern cleaned up the pipes of the retort on Saturday and filled 10 flasks with quicksilver as the result. The furnace for working dirt and low grade ore is nearly completed and will soon be in running order.

TULARE.

THE NEW ENGLAND MILL.—Visalia *Delta*, August 5: We learn that work on the mill of the New England smelting company is progressing rapidly. Although there is no road and nothing but the roughest of mountain trails, the superintendent, by his untiring energy, has got most of his machinery up, and will fit the mill first for sawing lumber, and then for crushing ore. Work will be commenced on the furnace at once, and it is expected that not less 100 tons of bullion will be shipped before snow falls. Some of the specimens brought in by Mr. Ford are very rich in silver glance, and a ton of the rock would assay away up amongst the thousands. As to whether there is a large body of that kind of ore, the mine is not sufficiently developed to determine.

TUOLUMNE.

THE LADY WASHINGTON.—Sonora *Union Democrat*, August 7: The vein of ore struck in this mine two weeks ago continues to maintain its thickness and quality, as the work progresses. The prospect is deemed good for an extensive and rich mine.

Nevada.

WASHOE DISTRICT.

SAVAGE.—Gold Hill *News*, August 5: Sinking the main incline below the 2200-ft level is going steadily forward, the bottom in fair sinking ground. There is still a small flow of water but not enough to occasion any delay or trouble. Driving the north drift on the 2200-ft level is making steady progress, also the main south drift on the same level, both these drifts are being run outside of the ore vein, and it is not the intention to commence cross-cutting the ledge on that level until the south drift shall have been connected with the north drift from the Hale & Norcross, so as to afford a better ventilation. Sinking the south winze below the 2200-ft level is going steadily forward.

CALIFORNIA.—The main north drift on the 1550-ft level is being gradually extended into the ore body, which is proving itself richer, if possible, than ever as the drift advances. Cross-cuts Nos. 4 and 5, on the 1550-foot levels have been connected during the week by the latteral drift in the ore vein. That drift is now being extended to the northward to meet another from cross-cut No. 6, which is being run in the ore vein, and will soon complete the connection of the lateral drifts in the ore veins for the entire length of the mine.

GOULD & CURRY.—Repairing the shaft at the tenth station is being pressed to completion with all the energy possible, every man being employed that can find room to work. Enlarging and timbering the drifts on the 1700-ft level, so as to give greater ventilation, is going forward as fast as the work can be accomplished.

CONSOLIDATED VIRGINIA.—Daily yield 600 tons of ore. The ore breasts on the lower levels are still making a most magnificent showing of rich ore, and the usual monthly quota of $1,500,000 has been accomplished with four days less than the usual monthly run, giving a big surplus to carry over, if desired, to that of the next month. Thus the Consolidated Virginia, instead of showing a decrease in the yield of bullion, is proving that with scarce an effort she can easily increase her yield half a million more, and her dividends in proportion. Sinking the C. & C. shaft is going steadily forward, and the erection of the ponderous machinery for the new works is being steadily pushed ahead with the usual vigor of the management.

CHOLLAR-POTOSI.—Sinking the new combination shaft is making rapid progress. It is now down to a depth of 150 ft, having been sunk a distance of 31 ft during the past month, a depth which, considering its great size, is almost without a precedent in the hard rock of this section. The frame work for the new building is almost completed; also that of the machine shop, blacksmith shop, carpenter shop and boiler works. Sinking the main incline at the old works goes steadily forward, without change of interest to report. The south drifts on the 1150, 1250 and 1350-ft levels are all steadily advancing, the face of that of the 1350-ft level being in hard blasting ground. Daily yield, 75 tons of ore, the assay value of which is $28 to $30 per ton.

OPHIR.—Repairing and retimbering the shaft is being prosecuted with all the vigor possible. The erection of the new and powerful incline machinery is fast approaching completion, and the foundations are about ready for the reception of the new pumping engine. The new building is inclosed, and in fact all the outside work is advancing as rapidly as it is possible for it to be done. The mills are kept steadily running on the reserve or supply, and the prospects of the speedy development of the lower levels of the mine are daily becoming brighter.

AMAZON.—The shaft has been sunk 16 ft since our last report, making a total depth of 134 feet. The rock in the bottom blasts well, and good progress is being made. The winze in the vein below the first station level is down 46 feet, the quartz in the bottom being much harder, and showing a decided improvement as the winze advances downward. Everything in and about the mine is in fine working condition; the future prospects are bright and flattering.

BELCHER.—There is little or no change in the daily yield of the mine, or the general appearance of the ore producing sections. The ventilation of the 1500-ft level, by means of the connecting drift with the Crown Point, is fast cooling the level, and preparing the way for working that portion with speed and comfort. The main prospecting drift on the 1600-ft levels is making good progress. Nothing new of any other portion.

YELLOW JACKET.—The south winze is down 150 feet below the 1740-ft level, the bottom in good sinking ground and quite dry. The north winze on the same level is down 68 feet, with a slight flow of water at the bottom. Both the north and east drifts on the 1740-ft level are steadily advancing, with no new or valuable features to report.

CROWN POINT.—Daily yield 500 tons of ore. There are no particular changes to report of the ore-producing sections of the mine. Driving the prospecting drift on the 1700-ft level is making good progress and it will not be long in reaching the ledge when we hope to record the finding of a new bonanza as rich and valuable as that of the old.

Pre-Historic Remains of the Pacific Coast.

The remarkable group of islands off our Southern coast was once thickly populated by a people whose food consisted mainly of eatable shell-fish, principally of the abalones and the mussel. Among the shells that have accumulated as kitchen refuse, on many places along the shores and even on higher slopes on the islands, Mr. Paul Schumacher, sent out by the Smithsonian Institute to continue his successful exploration of a year past, searched the graves of a by-gone population, which are found near the kitchen refuse, and the places where formerly their houses stood. With the skeletons were fouud buried the implements of stone, shells and bone. On the islaud he especially brought to light many new forms of implements for hunting and fishing; also ornaments of great variety, worked out of stones, hones, and particularly of the beautifully colored shell *Kaliotis*. In recent graves he even found glass beads of somewhat *rococo* style, and made of a kind of glass not now found in the Bohemian glass-factories. Such finds may date from the discovery of California by Cabrillo, in 1542, who reported some of these islands as having been thickly populated. The kitchen utensils consists of pots of all sizes and forms, worked out of magnesia aud mica, and of bowls made of serpentine—all polished. The mortars are chiseled out of sandstone and often handsomely oruamented, some even with bas-relief, as found on St. Nicholas island, others again with shells sunk in the upper rim and cemented with asphaltum. The islanders, as well as those living on the mainland, have been, no doubt, clever smokers, as pipes are not rarely found. Of works of art, sculptnres were found representing sea lious, fish, fowls and idols, etc. This work, done either in soapstone or serpentine, is neatly executed and polished.

After the exploration on the island was done, Mr. Schumacher went over to the mainlaud (where in the meantime a division of Wheeler's exploring party, under Dr. Yarrow, was busily engeged in exhuming antiqnties and in exploring the historical site of Dos Pueblos), and oompleted his collection with all such articles and varieties of forms as are fonnd in that part of our coast. His collection made for the Smithsonian Institute in 1874, together witu that of this year, which comprises over seventy cases, will be a full representation of the archeology of the southern coast of California.

As the season has advanced and the Smithsoniau Institute is desirous that Mr. Schumacher should visit the coast of Oregon, where he obtained some results two years ago, he has left the lower coast, and is now in this city preparing for the northern trip. He requests us to acknowledge the courteous assistsnce of some of our Government officers, and to the liberal favors of the Pacific railroad companies. Mr. Sohumacher is soon going to leave for Oregon, and as the pursuit of his exploration is hy no means a small task, more so in country where the still living Indians may interrupt suoh investigations with the strong desire to take the scalp of the explorer, we hope that our Oregonian friends will give him a kiudly reception and such advice and assistance as they can conveniently.—*Alta*.

New Method of Making Nuts.

A Richmond (Va.) gentleman has iuvented a new method of manufacturing nuts, which is thus described:

Mnck iron is rolled into the required shape to make a hollow pile, by forming two sides with top and bottom of half circle, octagonal or hexagonal exterior, or a square hollow faggot, just as may he desired. This pile is heated in the usual manner, and before being given to the rolls a mandrel is introduced into the interior or hollow of the pile, which mandrel is held in position by being attached to the end of a rod or chain, the other end of which is supplied with a collar which falls behiud a notched rest or brace which holds the maudrel in place as the pile is introduced to the bite of the rolls and passes through them. Thus the exterior of the bars, and the iuterior, are formed at the same time aud the weld completed. The further reduction and finish of the bar ie accomplished by a repetition of the manipulation in the euccessive use of smaller maudrels and emaller groves in the rolls. Theu, before the bar has lost the heat it is given to a gang saw and by one movement cut up into blanks of the required thickness of exactly uniform size and weight, ready for the reamer and milling and chamfering machine.

Among the advantagee claimed for this process are that the nuts can be mannfactured much cheaper than by the old process, they are stronger, and consequently can be lighter, aud thus more of them obtained from a given weight of iron.

To Work Harn Steel.—If steel is rather hard under the hammer when heated to the proper cherry-red, it may be covered with salt aud hammered to about the shape desired. More softness can then be obtained; if required to give a further finish to the shape, by sprinkling it with a mixture of salt, blue vitroil, sal-ammoniac, saltpetre aud alum, made cherry-red again, sprinkled with this mixture and hammered into shape. Thie process may be repeated until entirely finished. When ready the steel is hardened in a solution of the same mixture. Thie method is recommended by Mr. W. R. Lake.

San Francisco Microscopical Society.

The stated meeting of the San Francisco Microscopical Society wss held on Monday evening, the 5th inst., President Ashburner in the chair. The cabinet was enriched by a donation from Mr. J. P. Moore of five slides mounted hy him, with wood sections, traverse and longitudinal, viz: *Torreya Californica*, or California nutmeg; *Oreodaphne Californica*, or California laurel or bay tree; and *Balsa*, a wood used by the natives of Central America for the purpose of making canoes, boats, etc., on account of its extreme lightness.

Dr. James Blake donated a slide mounted by him with diatoms from Echo lake, Califoruia, and a supply of diatomaceous earth from the same locality, for mounting. The bottom of the lake as stated by Dr. Blake, is composed almost entirely of diatoms, there being not more than four-tenths of one per cent. of for eign matter, the form being mainly *Gallionella*.

Mr. Charles F. Lightner presented two varieties of aphidæ, collected July 26th, on Morrisania ranch, Napa county, California, for examination and mounting.

Mr. W. A. Woodward presented a very destructive coleopterous insect, which had been damaging the apple and pear trees and grape vines for some years past. The line of operations of this beetle is to attack the vine or twig, and by sinking a shaft from the surface and then running a series of drifts, so weaken the structure that it breaks off and falls to the grouud. The specimens were obtained from Penn's grove, Sonoma county, and with a promise of a larger numbsr for future examination, the matter was passed for the present.

Mr. Dameron hrought to the rooms some Eastern oysters, the spat of which was examined aud found to be living, the embryo oysters being as lively as those ehown at the last exhibition of the society. This fact shows the need of some systematic efforts to ascertain the causes of the failnre to propagate the Eastern variety on this coast, as it is a well-known fact that they mature and fatten finely wheu transplanted from Eastern beds, bnt as yet have not multiplied like those to the manor born.

Mr. H. C. Hyde exhibited some beautiful test objects, among them the Lord's Prayer engraved on glass in so small a space that it requires a very high power and careful illnmination to resolve so as to be read. Mr. Webb, of England, is the only maker of these slides, and when it is stated that mechanism has succeeded in his hands in reducing things to so fine a poiut that the contents of six Bibles, on the same scale, would occnpy a space hut an inch square, some idea of the object in question may be formed.

A Strong Room.

The London *Daily News* gives the following description of the new premises of the Safe Deposit company in Bucklersbury, London: The building, roughly speaking, is divided into two divisions—namely, office and safe. There are in the building four tiers of safes, and, as tenders to them, four tiers of offices. These two divisions are separated by a brick wall three feet thick, through which there is only one entrance on each floor, such entrance being a massive corrugated iron door that has stood the test of two days' fire without flinching. The "safe" division of the building contains thirty-two distinct chambers, and each chamber contains many hundreds of compartments, great and small, for the deposit of papers, etc. The walls of this gigantic safe are composed of three feet of the hardest blue Staffordshire brick, with an exterior of fire bricks, and inside there is an armor plating four inches thick, cast on a wrought iron gridiron, that is calculated to make entrance doubly impossible. Around this parent eafe there is a clearly defined passage, which will be patrolled night and day. To each department of this gigantic repository there is a door composed of twelve inches in thickness of solid steel, slid into grooves by hydranlic machinery, and behind which there is a perpetual pressure of 160 tons. These doors are composed of steel so tempered that the greatest expert who could be fouud in the country, after drilling vigorously for a week, found that he had progressed only half an inch aod retired dishartened. To gnard against nefarious entrance to the premises hy horing from below, there is, as a final floor to the building, a tank of eight feet of water, to reach which an enterprising burglar would have to engineer his way through fifteen feet of concrete, for the mere pleasure of finding himself drowned like a rat in a hole. The water in this tank is used for a variety of purposes, being ultimately sent with a rush to the top of the building. The steam engines, boilers and all the machinery are in duplicate; so, that one set failiug, the concern will not be brought to a standstill.

Painting Old Buildings.—An inexpensive but durable method of painting old buildings is as follows: First give them a coat of crude petroleum, which is the oil as it comes from the wells, and which can be procnred for four or five dollars per barrel. Then mix one pound of "metallic paint," which is brown or red hematite iron and finely ground, to one quart of linseed oil, and apply this over the petroleum coat. The petroleum sinks into the wood and makes a ground work for the iron and oil paint. The color of the iron paiut is a dark reddish brown, and ie not at all disagreeable; it is a color not easily soiled, very durable, and is fire-proof.

Carelessness in the Use of Machinery.

An exchange offers the following good suggestions to its readers:

If one who looks over the newspapers daily should compile the statistics of loss of life, or injury to body or limb by machinery, for one year, the aggregate would undoubtedly surprise the community. At least such is the presumption from the frequency of such records. We do not refer particularly to nnavoidable accidents caused by defects in machinery, or sudden or unlooked for contingencies, but to those that might he avoided by a moderate degree of carefulness. A large proportion of these are caused by handling belts, particularly throwing them on or off pulleys in motion. There is a right way and a wrong way to put on a belt. The belt should be first placed on the pulley at rest, and then rnn on to the one in motion. In some cases where the belt is heavy, or the shaft runs very swiftly, it is best to slow down the speed so that the shaft barely moves. Where this is impracticable, great care should be observed in mounting the belt on the pulley face. The operator should have a firm and solid foothold, and see to it that no part of his persou or clothing gets between the belt and the pulley.

Belts running from overhead shafts are frequently run off or on hy means of a long stick, the operator standing on the floor. In throwing a belt off, the danger of accident is not great, but in running a belt on in this manner, the stick is liable to be caught and thrown with great violence, at the hazard of breaking human heads or valuable machines. The practice is reprehensible.

A common practice is to stand on the floor, and oast the belt on the face of the revolving overhead pulley. Once on, it must be held motionless in its place with one hand, against the friction of the pulley face, while the other hand guides it on the loose pulley of the machine, or the tight pulley, if there be no loose pulley. The danger is obvious—the belt may catch in a projecting key, or the head of a set screw, or double under on the shaft, when it will wind up with a velocity corresponding to the speed of the shaft, and perhaps carry the workman with it.

It would seem to be within the bounds of inventive possibility to construct some cheap and effective implement for throwing on belts.

The practice of leaving long ends of lacings or torn up flaps of splicings to catch into clothing or any projecting object, is not a good one. Small as this matter is, and alight as are these leather thongs and scraps, we have known of painful accidents being caused by them.

Using fast and loose pulleys without a belt guide, leads to deplorable accidents. One lately occurred in this State. A man was adjusting a pair of powerful steam shears and by some means, and all unexpecedily to him, the belt on the loose pulley worked over on the stationary pulley, and set the shears in motion. His left arm at the time was between the blades, which, closing with great force, nearly severed the arm near the wrist, cutting through the flesh and bone, and leaving the hand hanging by a few tendons and the skin. The arm was amputated near the elbow. The shipper or belt guide should have an automatic catch which secures the belt on either pulley. Many concerns use this preventative, and it is so easily applied, in one form or another, and is so certain in its operation, that it should be generally adopted. Unless the shafts are perfectly in line—a condition continually liable to change—and the faces of the pulleys are crowning, there is danger of the belt working from one pulley to another.

There are other careless practices among mechanics and those having the charge of machinery, which it is scarcely necessary to enumerate. The general thoughtless handling of machines, cleaning parts of machines while in motion, adjnsting parts that should be at rest while being acted on, and other habits contracted by familiarity, should be avoided. A machine ought not be trifled with. It has no remorse or pity. Once in its power, there is no escape with impunity. It should be managed with caution and constant care, for in dealing with machinery it is always better to be foolishly careful than foolishly careless.

New Method of Lighting Street Lamps.—A German engineer has invented a new method of lighting street gas lamps more simple and durable than by electricity. The apparatus can be affixed equally to all gas jets, and it is made to act, not by any special mechauism, but simply by the increased pressure of the gas, which is always laid on from the gasometer when the lamps should be lighted. The one act of turning on the gas at the main ignitee it at all the burners fitted with the new apparatus. When the pressnre is diminished at the main, the gas can either he totally extinguished or let down to a thread. It is chiefly in the lighting of the streets of a town that the invention will be of practical use. As soon as the gas is turned on, the whole city will be eimultaneously illnminated, and when in the early morning, the pressure is reduced the light may he totally extinguished or gradually diminished. This apparatus has been adopted at Heidelberg.

Paint for Hot Iron.—The best material to put upon iron subject to any considerable degree of heat, as a steam pipe or smoke stack, is a preparation of coal tar, commonly called black varnish.

Colorano is to be known as the "Centennial State."

Sound Castings.

In our issue of July 31st we gave an extract from *Iron* on the subject of obtaining sound castings. We continue the subject to-day:

The formation of blow holes in castings is bnt one of the minor evils to which castings are heirs, and this principally because the results are so evideot and plain to be seen. One of the most dangerous periods in the life of a casting is the cooling, when the contraction of the various parts in the mold is setting in. The general principles, and laws of this shrinking are but little understood or appreciated even by founders themselves.

The whole danger lies in the shrinking not taking place simultaneously. Given a caetiog of any complexity of form, there cannot be the slightest danger of breakage from shrinkage if the cooling throughout takes place simultaneously, and if the cores will give to the contraction. This latter necessary quality of the cores should be carefully seeu to, as evidently, if the cores will not give, the casting must burst under the contracting strain. There is, however, great danger to the casting, when the cooling is not simultaneous, of many portions being placed under great tension, even to such an extent as to cause them to part. Now this simultaneous rate of cooling is very seldom to be obtained naturally in any casting. In a very great proportions of castings the sections of metal are by no means equal throughout, and even if they are, the inner portions of the casting are not able to radiate their heat away with the same facility as the outer ones. The rate of cooling is primarily dependent on the proportion of the outside cooling surface to the mass of interior metal in any portion. The regularity of this proportion is one of the most essential points that should have the consideration of the designer. This is too often neglected, since the design is frequently made hy men or youths unacquainted with the laws of cooling or contraction. Bnt very often it is impossible to design the casting with equal masses of metal throughout, and then the rate of cooling will be inversely proportional to the relative areas of the sections compared with their perimeters. The rate of cooling will also, secoodarily, depend on its position—whether surrounded by or in close proximity with other metal, or whether to the outside of the mold.

The success or soundness of a casting uuder contraction is, then, dependent in the first place on the designer, that all parts should, as far as possible, be of even proportion as to their mass and perimeter, and where this is impossible the responsibility will devolve upon the founder, who must, by artificial accelerated cooling by early uncovering, or by retarded cooling hy hot plates, endeavor to produce a simultaneous rate of cooling throughout the casting.

There is still another most useful precantion in the hands of the desiguer, and that is to evade the disastrous effects of irregnlar contractiou. We will now explain what may be considered to take place, during cooling in the mold, in a very common instance, that of a rigger. The outside face of a rigger is nsually of very slight section, aud being situated to the outside of the mold is in peculiarly favorable circumstances for rapid cooling. The rim will thus cool and contract much the first, whilst the arms and boss are still hot, the arms being slightly compressed to permit the shrinkage of the rim. When the arms and boss are then cooled and contract, the rim is already set and rigid, and cannot give to the contraction of the arms. These latter, then, heing put under high tension, will probably part, as is generally eeen to be the case in straight armed riggers; each double arm, forming a diameter, having parted on one side or the other. This is a perfectly simple course of action under the natural laws, and is the key to nioety-nine out of a hundred unexpected breakages of castings, under slight strain. For in some instances, while the difference in time of cooling is but slight, and the section of metal strong, the contraction does not alwaye produce breakage in the mold, but the castings are delivered, apparently sound, nntil subjected to a slight strain or sudden jar; when the already severely strained portions at once break, long before the normal breaking strain is reached. This peculiar danger of portion of the casting being, though apparently sound, yet under abnormal tension, may be well illustrated by the two following cases. A sqnare plate of thin section, with a heavy boss in the middle, was taken out of the sand apparently sound, and placed till wanted in a yard. After some little time had elapsed it was fonnd to have split spontaneously right across the center, and it was noticed that the slit was widest across the central boss, or strongest part, and scarcely reached to the outside edges, or weakest parts. Now this apparent paradox may be easily explained by reference to the above instance of the rigger, the action being exactly the same. The outside of the plate, offering large surface and small section, cooled much sooner than the heavy central boss and internal portion of the plate. The outside of the plate having thus taken its set, compressing the liquid or hot metal within by contracting, offers a perfectly rigid resistance to the after contraction of the boss and center. The outside and center were thus straining against one another in opposite direc ions, not being able at first to part, but at last doing so under the influence, probably, of the expansion and contraction caused in it by the weather. The use of this foundation plate might thus have seriously endangered the safety of some structure or crane for which it was doubtless intended.

Useful Information.

To Kalsomine a Wall.

Buy tha best bleached glue if the walls are to be white or some light tint, (if dark, it is immaterial, so the glue is clean,) and use it in the proportion of a quarter of a pound of glue to eight pounds of whiting. Soak the glue over night; in the morning pour off the water, as tha glue simply swells while soaking. Add fresh water, put it in a tin pail, and set that in a kettle of boiling water. When dissolved, stir into it the whiting, adding enough water to make it, after mixing, of the same consistence as common whitewash. It may be tinted to any color desired, and is applied with a whitewash brush. If the color is rubbed smooth in a little water, and then mixed with tha wash, it will be more even. If the walls have been previously whitewashed, scrape away all that will come off, and wash with a solution of white vitriol, two ounces, in a pail of water The vitriol will be decomposed, forming zinc white and plaster-of-paris, to which the kalsomining easily adhares. It is important to dissolve the glue in a hot water bath; for if scorched by too great heat its tanacity is impaired or dastroyed. Whiting is simply chalk freed from impurities and reduced to a fina powder.

There is graat difference in whitawash brushas, and the beauty of the work, as wall as the ease of performing it, depende very much on a good brush, making it wall worth while to pay the difference between a good one and a cheap one. For the inexperienced it is more difficult to lay on tints evenly than pure white. —*Maryland Farmer.*

To Preserve Iron from Rust.—The following composition is said to preserve iron from rust, and also to be applicable to other materials, such as stone or wood, used in conjunction with iron or other metal, in the formation of reservoirs or other works: Virgin wax, 100 parts; Gallipoli, 125; Norwegian pitch, 200; grease, 100; bitumen of Judea, 100; gutta-percha, 235; red lead, 120; and white lead, 20; all of which, says the inventor, have their special value. The materials are mixed in a boiler in the order in which they are given, the gutta-percha being cut up in small peices, or rasped. Tha mixture must be well stirred at each addition, and, when homeogencons, is poured into monlds, and looks like chocolate. Whan used for preserving iron from rast it is melted and laid on with a brush; but for stopping holes, etc., it must be in a pasty stata. It may also be used as a glue to fix a peica of metal over a hola. For certain purposes, such as stopping holes in large vertical metal surfaces, composition is slightly varied, tha Gallipoli being reduced to 115, the bitumen to 90, and the red lead to 100, while 40 parts of gum copal are added next to the gutta-percha.

Ventilation Without Draft.—Fit the centar frame of the top sash of a window with double panes of glass, one attachad to the outer margin of the frame, and the other to tha inner, leaving an interval of about an inch between. The outer pane is deficient for the last inch at the bottom, and the inner pane for an inch at the top, thus allowing a current of air to enter the bottom of the outside pane, pass upward between tha two, and enter the room in a vertical direction, causing no draft but maintaining an almost constant supply of frash air, which can be increased or diminished to any extent in proportion to the number of panes thus treated.—*Herald of Health.*

Cane Fiber Felt.—An article of original manufacture, called cane fiber felt, is made by a Virginia company. It is the only felt made from cane in the world. It is used as a lining under tin, slate and shingle roofs, and for deafening floors; it also forms a cheap carpet lining, and is a substitute for plastar; in fact serves any use for which felt can be employed in buildings. It is a non-conductor of heat and cold, and impervious to water or moistura. This felt is plain or rosin sized, tha latter as well as tha former being inodorous. It is cheap, durable and free from objections that characterize other felts.

Cheap Process for Bronzing Articles Made of Iron Wire.—Clean the wire perfectly, and then immerse it in a solution of sulphate of copper until covered with a coating of metallic copper. Then wash and immerse the article in the following solution: verdigris, two ounces; salammoniac, one ounce; vinegar, one pint; diluted with water until it tastes only slightly metallic, and then boiled for a few minutes and filtered. The articles are steeped in this liquor, at the boiling point, until the desired effect is produced; but do not keep them in too long. When taken out wash carefully in hot water and dry.

Old engravings, wood cuts, or printed matter, that have turned yellow, may be rendered white by first washing carefully in water containing a little hyposulphite of soda and then dipping for a minute in Javelle water. To prepare the latter, put four pounds bicarbonate of soda in a kettle over a fire; add one gallon of boiling water, and let it boil for fifteen minutes. Then stir in one pound of pulverized chloride of lime. When cold, the liquid can be kept in a jug ready for use.

The Action of Ammonia on Varnish.

Every one knows that oils, when brought in contact with alkalies, are more or less readily converted into soaps soluble in water. Among the most easily saponified oils is linseed, which, when shaken up with a solution of potash, soda, or ammonia, unites with the alkali, forming a thick emulsion of soft soap. It is also a familiar fact that ammonia is a gas always present in the air, especially wherever organic decay is going on, as in barnyards and stables. If a varnished carriage is exposed to this gaseous ammonia arising from manura heaps or decaying vegetable matter, tha alkali combines with the oil of the varnish, forming an almost imperceptible film of soap. When the vehicle is washed, this is dissolved and removed, leaving a fresh surface to be again acted apon by the ammonia. The oil being thus gradually removed, the varnish becomes brittle and more liable to crack. It is found that this cracking is most common on the upper surfaces and projecting parts of the carriage; probably, as an accomplished chemist who has looked into the matter suggests, because these parts "are most subjected to the influence of tha ammonia, by the falling on them of particles of dust impregnated with the gas." The obvious "moral" is, that varnished carriages should not be kept in a stable, or in a building where vegetables liable to decay are stored. A friend has told us of a case in which the varnish on the back part of a carriage was found to be badly damaged, while on tha other portions it was comparatively uninjured. This was a mystery until it was observed that some potatoes, in a barrel standing in the rear of the vehicle, were decaying. The mischief was doubtless caused by the ammonia evolved from this source. It is no uncommon thing for farmers to keep vegetables in their carriage-house, but it will be seen that tha varnish may suffer for it, if tha vegetables happen to decay. In any place where elegant carriages are kept, nothing should be allowed that can possibly give rise to ammoniacal vapors.—*Boston Journal of Chemistry.*

A non-drying cement of great tenacity, useful for fastening plates of glass so as to exclude air, but which may be easily separated, is formed by adding freshly slaked lime to double its weight of India rubber, and heating to about 400° Fah., when the rubber will be converted into a glutinous mass.

The Electric Light.—An ordinary light-house where oil is used gives an illuminating power equal to about 200 candles. An electric light in England flashes over the North Sea its condensed beams, each of which is more than an equivalent to the combined light of 800,000 candles.

Petroleum constantly applied to the cutting tools will enable the cutting of tha hardest alloys with the same ease as steel tempered to straw color. The latter is far more easily worked by keeping the cutter moistened with a mixture of petroleum and turpentine.

Glycerine paste for office use may be prepared by dissolving one ounce of gum arabic and two drachms glycerina in three ounces of boiling water.

Squeaking Boots.—It is said that a peg driven into the middle of the sole of a new squeaking boot will stop its noise.

A putty of starch and chlorida of zinc hardens quickly, and lasts, as a stoppar of holes in metals, for months.

Good Health.

Sunstroke.

Sunstroke is frequently brought on by persistent fretting.

The exhaustion of the nerves is one of the precedent conditions of the diseasa, and there is nothing which exhausts the nervas so surely as fretting.

An unexceptionally able physician has said that mental labor never alone produces disease of the brain, but that "worry" is tha chief source of softening of tha brain, and that paralysis which is distinct from apoplexy.

Now if you believe that sunstroke is caused in a similar way, you will comprehend why we have sometimes a hundred cases in a day in our country, but in Italy, where the heat lasts steadily for four months in the year, the disease is nearly unknown.

The reason is that most Americans, when the hot weather begins, go into training for sunstroke, and ignorantly do everything which can produce it.

What we ought to do in hot weather is evident. First, we must keep our minds easy and contented. Secondly, we should drink nothing but moderately cool water, and very little of that. Ice-water is the bane of America, and probably kills nearly as many people as alcohol.

Thirdly, we should avoid so far as is possible all work which overheats and exhausts us.

To Remove Freckles.—A simple remedy for removing freckles is a pint of sour milk and a small quantity of horse-raddish. Let the mixture stand over night, and use it as a wash three times a day until the freckles disappear.

The Active Element of Cod Liver Oil.

Why does cod liver oil produce better results than any other oil? One of the earliest answers given to this question was, because it contains iodine; but the amount of iodine contained therein is exceedingly small, and no greater than that found in salt water fish and oysters. The statements as to the presence of biliary matters rest on imperfect and somewhat antiquated chemistry, but may perhaps after all ha not without weight. Naumann showed that fish liver oil passed through membranes with greater facility than any other fat oil; and that liver oil, deprived as far as possible of its biliary matters, lost much of this property and behaved like other oils.

Buchheim finds in cod liver oil a considerable proportion of free fatty acids, which render more rapid and thorough the saponification and absorption of the oil by tha alkaline fluids of the duodenum. What the precise proportion between free fatty acids and the glycerides may be which is most favorable to their digestion, is a point yet to be determined. It does not follow that it is the same as that existing in cod liver oil. Ha therefore hopes, since stearic and palmitic acids are solid at ordinary temperatures, that some means may be found for manufacturing in abundance pura oleic acid, which may either be used alone or added to cod liver oil, and replace the partially decomposed oleic acid to which tha disagreeable odor and taste of the darker varieties of cod liver oil are due.—*Boston Med. and Surg. Journal.*

Flushed Cheeks.—Tha question has been asked tha *Herald of Health* why people who drink much alcoholic drinks have a red nose and flushed cheeks. That journal answers as follows: Alcohol paralyzes the nerves of the small bloodvessels, and they become dilated, filling with blood. Tha flush seen on tha cheek during the first stage of alcoholic excitation is commonly presumed to extend merely to the parts exposed to view. It cannot, however, be too forcibly impressed that the condition is universal in the body. If the lungs could be seen, they too would be found with their vessels injected; if tha brain and spinal cord could be laid open to view, they would be discovered in the same condition, and so on. Dr. Richardson said he had witnessed this vascular condition of the lungs of an animal killed suddenly when under the influence of alcohol. He once had tha opportunity of observing the same phenomenon in the brain stracture of a man who, in a paroxysm of alcoholic frenzy, had his brains dashed out by the wheels of a railway carriage. The brain, entire, was examined three minutes after death. It exhaled tha odor of spirit; its membranes and minute structura were vascular in the extreme. "It looked as if it had been injected with varmilion." The white matter of tha cerebrum could scarcely be distinguished, and the pia mater, the internal vascular membrana covering the brain, resembled a delicate web of coagulated red blood.

Action of Alcohol on the Blood.—Alcohol in its passage through the body first reaches tha blood, and coming in contact with all parts of it causes the corpuscles to run too closely together, and to adhere in rolls; it may modify their outline, making the clearly defined, smooth outer edge irregular or crenate, or even starlike; it may change tha red corpuscle into the oval form; or in very extreme cases it may produce a truncated form of corpascle, in which the change is so great that if we did not trace it through all its phases we should be puzzled to know whether tha object were indeed a blood cell. These changes are due to the action of tha spirit on the water contained in tha corpuscles. While these changes are going on tha power to absorb and fix gases is impaired, and when tha aggregation of the cells in masses is great, other difficulties arise, for tha cells united together pass less easily than they should through the minute vessels, and thus impede the current. Alcohol in excess acts also on the fibrine of tha blood. It may act in two ways, according to the degree in which it affects the water that holds the fibrina in solution. It may fix the water with the fibrine, and thus destroy the power of coagulation; or it may extract the water so as to produce coagulation. This explains why in acute cases of poisoning by alcohol, the blood is sometimes found quite fluid, at other times firmly coagulated in tha vessels.—*Herald of Health.*

Welcome Spare Beds.—One rule ought to be invariable with every good housekeeper—that tha bed in the guest-chamber shall never be "made" except when it is to be directly used. Let it lie fallow between whiles, and turn the mattresses every few days, with all precautions against dampness gathering upon them. Then, when put in order with fresh sheets and blankets, having the dry heat of the kitchen fire in them, there will be small risk of that chill which travelers dread. A room kept andampened, sweet, and non-wholesome, with a dry bed and plenty of well aired bed clothes is within the power of the humblest to give their guests, and is all that sensible visitors ask.

Earache.—There is scarcely any ache to which children are subject, as bad to bear and difficult to cure, as the earache. But there is a remedy, which is said to be pretty generally effectual. Take a bit of cotton batting, put upon it a pinch of black pepper, gather it up and tie; dip it in sweet oil, and insert into the ear. Put a flannel bandage over the head and keep it warm. It will give immediate relief.

Domestic Economy.

A Substitute for Soap.

A lady writes to one of our agricultural papers, and communicates the following with regard to tha use of soap. We supposa she knows of what she speaks, but many housekeepers will be likely to regard her statements as bordering on moonshine. But listen:

"Without giving any recipes for making soap, I wish to tell all the hard-worked farmers' wives how much labor they may save by not using such vast quantities of this article. For nearly five years I have used soap only for washing clothes. In all that time I have not used one pound of soap for washing dishes and other kitchen purposes. My family has ranged from three to twenty-five. I have used cistern water, limestone water, as hard as possible, and hard water composed of other ingredients besides lime, and I find with all these my plan works equally well. It is this: Have your water quite hot, and add a very little milk to it. This softens the water, gives tha dishes a fine gloss, and preserves the hands; it removes the grease, even that from hand, and yet no grease is ever found floating on the water, as when soap is used. The stone vessels I always set on the stove with a little water in them when the victuals are taken from them; then they are hot when I am ready to wash them, and tha grease is easily removed.

"Just try my plan, you who toil day after day every spring to make that barrel of soap, and let us hear how it succeeds with you. I like the great barral of soap on washing-day, but am glad to dispense with its aid on all other occasions. I find that my tinware keeps bright longer when cleansed in this way than by using soap or by scouring. The habit so many of us have acquired of scouring tins is a wasteful policy; tha present style of tinware will not bear it. The tin is soon scrubbed away, and a vessel that is fit for nothing left on our hands; but if washed in the way I have described, the tin is preserved and is always bright and clean."

Brine that will Preserve Butter a Year.—Among the many devices for keeping butter in a manner that will preserve tha fresh rosy flavor of new, with all its sweetness, is the following from the Duchess *Farmer:* To three gallons of brine strong enough to bear an egg, add a quarter of a pound of nice white sugar and a tablespoonful of saltpetre. Boil tha brine, and when it is cold, strain carefully. Make your butter into rolls, and wrap each separately in a clean, white muslin cloth, tying up with a string. Pack a large jar full, weight the butter down, and pour over the brine until all is submerged. This will keep really good butter perfectly sweet and fresh for a whole year. Be careful to not put upon ice, butter that you wish to keep for any length of time. In summer, when the heat will not admit of butter being made into rolls, pack closely in small jars, and, using the same brine, allow it to cover the butter to the depth of at least four inches. This excludes the air and answers very nearly as well as the first method suggested.

Onions.—I think it is admitted that the majority of people like onions as food, and, only for the perfume, many would eat them who now do not. That they are antiscorbatic as well as antiseptic is also admitted, and this is tha way I prepare them. A few moments before eating they should be sliced quite thin and sprinkled plentifully with sugar, and you have a palatable relish which will not rise on the stomach or produce heartburn. A trial will afford proof.—*Wynkoop.*

To Cook Mutton.—Every week or two we kill a mutton. I roast it all. I put it in the oven in a large bakepan, put it in water, cook till eleven; turn it over twice; everyone who eats a mutton hare says it is tha best they ever ate. At eleven o'clock take out the mutton, fill tha pan full of potatoes and bake them; thicken tha gravy, and you need little else for a dinner fit for a —wall, anybody. Kings are no better than we are.

To Preserve Lemons Fresh.—Slice them as thin as possible, and put into a nice sweet jar with alternate layers of sugar and lemon; remove all the seeds, have each layer entirely covered with sugar; tie a thick cloth over the jar before putting the cover on, so as to exclude all the air. I have kept them perfectly fresh for a year in this way.

To Bake Ham.—Most people boil ham. It is much better baked, if baked right. Soak for an hour in clean water and wipe dry. Next spread it all over with thin butter and then put it in a deep dish with sticks under it to keep it out of the gravy. When it is fully done take off the skin and matters crusted on the flesh side and set it away to cool.

Beet Vinegar.—Grate the beet, says the *Farmers' Advocate*, and express the juice in a cheese press, or in any other way that may suggest itself, and put the liquor in an empty barrel; cover the bung-hole with gauze; and set it in the sun, and in twelve or fifteen days it will be ready for use.

Berry Tarts.—Cover gem pans with crust, as for little pies, and bake; when nearly done, fill up with berries and replace in the oven a few minutes.

MINING AND SCIENTIFIC PRESS.

W. B. EWER.....SENIOR EDITOR.

DEWEY & CO., Publishers.

W. B. EWER, JNO. L. BOONE

Office, No. 224 Sansome St., S. E. Corner of California St., San Francisco.

Subscription and Advertising Rates:

ADVERTISING RATES.—1 week.	1 month.	3 months.	1 year.
Per line..... .25	.80	$2.00	$5.00
One-half inch.....$1.00	3.00	7.50	24.00
One inch..... 1.50	4.00	12.00	40.00

Large advertisements at favorable rates. Special or reading notices, legal advertisements, notices appearing in extraordinary type or in particular parts of the paper inserted at special rates.

SUBSCRIPTIONS payable in advance—For one year, $4; six months, $2.25; three months, $1.25. Remittances by Registered letters or P. O. orders at our risk.

SAMPLE COPIES.—Occasionally we send copies of this paper to persons who we believe would be benefited by subscribing for it, or willing to assist us in extending its circulation. We call the attention of such to our prospectus and terms of subscription.

San Francisco:
Saturday Morning, Aug. 14, 1875.

TABLE OF CONTENTS.

GENERAL EDITORIALS.—The State University; Guerin's Water Distributer and Meter, 97. Foundry Notes—Mining Machinery; The Iron Interests of the United States; Street Railroad Motors, 104. Montana Scenery, 105. Patents and Inventions, 108.

ILLUSTRATIONS.—Guerin's Module or Irrigation Meter, 97. Montana Scenery, 105.

SCIENTIFIC PROGRESS.—Prospects of Science on the Pacific Slope; New Applications of Paraffine; Chemical Filter; Rate of Growth of Coral; Industrial and Medical Application of Salicylic Acid; The Spider's Web; Poison in the Soil, 99.

MECHANICAL PROGRESS.—Peter Cooper's First American Locomotive; European Demands for American Engineering Instruments; The Monster Gun at Woolwich; The Largest Rifled Cannon; Headwork an Aid to Handiwork; A Mechanical Car Starter; New Mode of Lining Metallic Tubes with Another Metal; A Million Dollar Hammer; Enormous Locomotive Engines, 99.

MINING STOCK MARKET.—Sales at the San Francisco Stock Board; Notices of Assessments; Meetings and Dividends; Review of the Stock Market for the Week, 101.

MINING SUMMARY from the various counties in California and Nevada, 101.

USEFUL INFORMATION.—To Kalsomine a Wall; To Preserve Iron from Rust; Ventilation Without Draft; Cane Fiber Felt; Cheap Process for Bronzing Articles Made of Iron Wire; The Action of Ammonia on Varnish; The Electric Light, 103.

GOOD HEALTH.—Sunstroke; To Remove Freckles; The Active Element of Cod Liver Oil; Flushed Cheeks; Action of Alcohol on the Blood; Welcome Spare Beds; Earache, 103.

DOMESTIC ECONOMY.—A Substitute for Soap; Brine that will Preserve Butter a Year; Onions; To Cook Mutton; To Preserve Lemons Fresh; To Bake Ham; Beet Vinegar; Berry Tarts, 103.

MISCELLANEOUS.—Fatal Accident in the Eureka Consolidated Mine; Railroad Cars; The Jetty at the Mouth of the Mississippi; Adulteration; A Lake Superior Silver Mine; Tar and Oil for Furnaces; Sunflower for Fuel; A Venerable War Ship, 98. Prehistoric Remains of the Pacific Coast; New Method of Making Nuts; To Work Hard Steel; San Francisco Microscopical Society; A Strong Boom; Painting Old Buildings; Carelessness in the Use of Machinery; New Method of Lighting Street Lamps; Paint for Hot Iron; Sound Castings, 102. Now Compete for the Prizes; Come to San Francisco During the Fair; A Seamen's Home in San Francisco, 104. Something Reliable from the Black Hills; Mining Decisions and Patents, 105.

Now Compete for the Prizes.

[From Advance Sheet of the Mechanics' Fair Daily.]

This year exhibitors at the Fair should make as fine a display of their articles as can possibly be made. Remember the prizes—sixteen gold medals, fifty silver medals, Society diplomas, certificates of merit and special premiums, as the Board may determine. Here is an incentive for the ambitious to do their level best. Bring forward your articles and put them in competition. We hope to see an honorable emulation in this matter, and a spirit of friendly contest which will be of benefit to all. Judges will be appointed by the Board of Managers immediately upon the opening of the Exhibition, to examine all articles presented (only those, however, which are *receipted for*), and the managers will award premiums on such articles as the judges shall declare are worthy, which will be delivered as soon as they can be prepared. The mornings of each day until ten o'clock will be appropriated to the judges, and no visitors will be admitted during the time thus appropriated, except at the special request of the judges, or by permission of the managers. Now go in and win—"*Palmam meruit Ferat.*"

THE Santa Cruz and Watsonville railroad is finished to Tracy's, on the San Andres ranch, three miles from the Pajaro valley, and seven miles from the Watsonville depot. Workmen are now laying half a mile of track per day.

WORKMEN in each end of the Felton railroad tunnel, says the Santa Cruz *Sentinel*, converse with each other, so small is the space between them. The "bore" will be completed in a day or two.

VANDER NOOT & SON, of this city, sold a few days ago 250,000 stone paving blocks to Ruisch & Taylor, street contractors, of this city.

Foundry Notes—Mining Machinery.

The foundrymen of this city continue as busy as possible on all varieties of work. Mining machinery, however, occupies their principal attention, and material of this class is on hand at all the large foundries.

The most important mining machinery lately finished is that for the pumping works of the C. & C. shaft, made at the Union iron works, by Prescott, Scott & Co. The engine is a very large one, and is the first direct acting pumping engine built on this coast. Although a simple machine it is handsomely finished, and presents a fine appearance. The cylinder is forty inches in diameter, and eight feet stroke. The piston rod is twenty-two feet long, eight inches in diameter, and made of steel. The cylinder is surrounded with a steam jacket to prevent the condensation of steam; and every appliance to economize fuel, space and friction has been added. The steam and exhaust valves are made of brass, and are fitted with steel rods. The disposition of the steam valves insures the largest opening with the least loss of steam, and the position of exhaust valves allows the escape of all condensation in each end of the cylinder at every revolution. The valve gear is automatic in its action, and is supplied with all cut-offs and modern appliances. The devices used control the movements of the large piston perfectly, so that in case of the breakage of the dump rod or the pumps losing their water, there is no danger of the engine racing or doing any damage. The design comprehends the connection of the crosshead of the engine and the nose piece of the bob without the intervention, cost and risk of heavy gears, with their shafts, boxes, sole plates, foundations and appurtenances.

The machinery on the C. & C. shaft will now be the best on the Comstock and on the coast, if not in the world. The hoisting apparatus, which was made at the Pacific iron works, is the largest of the kind in the country. It has a hoisting capacity of 21,000 feet. There are two engines, twenty-six inch bore, six feet stroke, fitted with balanced puppet valves and cross cut-off. The cylinders weigh 16,000 pounds each. There is one engine at each end of the drum shaft, the distance between being twenty-four feet. The engines are fitted with two steam brakes, one for each reel, with an independent hand brake for each reel. Six tubular boilers, fifty-four inches in diameter and sixteen feet long, supply steam for this machinery. The Consolidated Virginia and California mines have now on their joint shaft direct hoisting and direct pumping engines, compound engines and every facility for quick and easy work. The new milling machinery is also a marvel of mechanism. Altogether the outfit is worth the visit of any mining man, and is a credit to our machinists.

The Iron Interests of the United States.

It has long been predicted that, by reason of the increase in the cost of English coal and labor, English iron masters and smelters would soon begin to turn their attention to the advantages possessed by the iron and coal fields of the United States. This prediction is already coming to pass. The London *Engineer* of a recent date says: "The mineral wealth of the United States has a great attraction just now, not only to the operative miners of this country, but likewise to certain of our iron masters. The most recent indication of this is the purchase by capitalists in Stockton-upon-Tees of an extensive tract of country in Tennessee, and the forming of a company, incorporated under the Companies Acts, 1862-67, in this country, and also under charter from that American State. The object is to work the minerals, and to make pig iron upon the property, which, among other contents, has, we are told, 52,000 acres of coal outcropping into water worn ravines in seams twelve feet thick, which can be mined by drift ways, without shafts or pumping. Near at hand there is mountain limestone two hundred feet thick: brown hematite and specular iron ores, free from sulphur and low in phosphorus, are found in seams varying from eighty feet to two hundred and forty feet in thickness, over several miles of country; and lest these should not be enough, there are also manganese ore, lead ore, and sulphate of baryta."

Iron building-girders are going into England from Belgium at lower prices than the English can produce them. This, taken together with the successful importation of Alabama iron, is opening the eyes of our English cousins to the fact that they can no longer monopolize the iron business of the world. At a recent meeting a principal manufacturer was moved to admit that he did not believe any one expected the iron trade to be again what it has been.

There can be no mistake but that the iron business is fast slipping away from England. The superiority of American over English steel is also being recognized everywhere, even among Englishmen themselves. The *Ironmonger*, a standard English publication, gracefully and frankly acknowledges the situation as follows:

"Surely we shall not have long to look in vain for the incorporation into steel making in England of that intelligence by which the best cutting steel of the New World is so superior as it is to that of the Old World. We are afraid that our edge tool makers are supine, and that, content with their general prosperity arising out of the making of large quantities at a price which yields them a fair profit, they are not sufficiently awake to the gravity of the consequences which may ensue upon the surpassing excellence of specific American hardware."

The world must soon look to the United States for the great bulk of its iron, and when that time comes an industry will be developed here which will speedily give this country commercial supremacy of the world.

Come to San Francisco During the Fair.

[From Advance Sheet of the Mechanics' Fair Daily.]

Residents of the interior who can possibly find time for a visit to the city, should by all means come while the Fair is in progress. They will find both amusement and instruction at the Pavilion, attended with very little expense. Those who are about to purchase their supplies for the winter, will find it greatly to their advantage to come here during the Fair, as they can combine business with rational instructive amusement. Farmers who are going to invest some of the profits of this year's crop in new agricultural machinery, can see all the different classes from the hands of different manufacturers. There will be quite an extensive display in this line at the Pavilion, and farmers can compare the various machines, and examine as to their merits. This machinery will be running, as the managers furnish all requisite power.

Miners can see all the pumps, drills and quartz machinery in operation, and can witness the competitive tests which will be made before the Committee of Awards. They can see machinery of all kinds, and can select that best suited to their respective wants. If they do not wish to purchase now, they can have the advantage of understanding exactly what they want when they do wish to buy.

Citizens of the interior generally, who can by any means find time to come to the city this year, should come during the Fair. It is not a representation of the interests of San Francisco alone, but of the entire State, and should be fostered by every part of California. Every possible variety of machines manufactured, and natural products, etc., will be shown. Good music will be provided, and fine pictures displayed. The crowd itself is worth going to see, and if a visitor does not choose to walk, he can take a seat in the galleries and watch the brilliant moving crowd which is continually moving to and fro. No better time could be desired for visiting the city than during the Fair. By the latter part of August our stormy winds will begin to subside, and the fogs disperse, and September is one the most pleasant months in San Francisco. A glimpse even, of the brilliant and lively scene, day or evening, will pay for a long journey.

STREET RAILROAD MOTORS.—The subject of street railroad transit is still attracting much attention in all the principal cities of the Union, and many are the devices which have been suggested or tried as a substitute for the horse. The fireless locomotive, using a boiler supercharged with steam at the termini, and when necessary at intermediate points, is still in operation; but with what success accounts are somewhat at variance. The coiled spring is also undergoing experiment, wound up by a steam engine at the termini. Another inventor employs a horizontal compressed air engine under the floor of the car. Thus the matter stands, while the companies are still awaiting other contributions to the subject.

In the mean time the *Scientific American* suggests that we had better let well enough alone, and doubts the economy of the use of locomotives except where the power of ten, twenty or more horses is desired. When only one or two is required that journal thinks the living horse is preferable to the iron one for the following reasons: "The trouble of raising a horse is less than the labor of building a locomotive in a shop. And the horse takes its own water and fuel when needed, and needs no stoker; it also continually repairs itself, until it is entirely worn out. Even then, at its dissolution there is no danger of bursting a boiler. It is always ready, and needs no firing up; and finally, having a sense of self-preservation, it will not blindly go ahead, and run into the river off an open drawbridge, as locomotives have often done. If it is objected that occasionally the control of horses has been lost by the driver, and that they ran off, it must be remembered that runaway locomotives are by no means uncommon. Taking all things into consideration we believe that the ordinary horse is a good institution, which it will be hard to surpass by labor in a machine shop."

AT a meeting of the Mechanics' State Council, on Sunday last, a letter from J. H. Wright, President of the Industrial Congress, fixed the 4th of July, 1876, as an appropriate day to make a national effort to establish the eight-hour system of labor in the United States.

THE Natoma water and mining company are vigorously prosecuting the construction of the outer wall of their canal near the American river at Folsom.

A BARREL factory is shortly to be started at Vanconver, Washington Territory.

A Seamen's Home for San Francisco.

[From Advance Sheet of the Mechanics' Fair Daily.]

One of the greatest needs of San Francisco, at this time, is a seamen's home, where the common sailors who enter this port may find a resting place while on shore, in which they may be free from the sharpers who so persistently and cruelly prey upon this simple hearted, but useful class of people in all seaports where their welware and interests are not looked after by humane and benevolent persons. There has hitherto been so much to do in this city in the way of public and benevolent work that this particular enterprise has been quite overlooked by our more wealthy people, and all that has been done has been accomplished by a few earnest, hard working ladies, with little or no pecuniary means at their command.

Several fairs have been held, and one notably, some five or six years since—known as "The New England Kitchen"—at which a considerable sum of money has been raised and slightly increased by annual contributions from the lady workers themselves, with which a large amount of good has already been done in aiding sick and destitute seamen, and in establishing temporary seamen's homes, in hired buildings, which have had to be given up after a little for lack of means to keep them going.

The work above alluded to has all been done under the direction of a society, known as the "Seamen's Aid Society," which has recently been putting forth a more determined effort in this behalf. This society has recently purchased a suitable and valuable lot on the northerly corner of Howard and Spear streets, at a cost of $14,300, the value of which, by the recent advance in real estate, has largely increased, and now they propose, in the further prosecution of their work, to establish, temporarily, one of those novel institutions known as a

New England Kitchen.

To this end a building about 140x30 feet in area has been erected at the corner of Eighth and Mission streets, directly opposite the Pavilion, in which, during the continuance of the coming "Mechanics' Fair," they propose to give a series of those peculiar entertainments, appropriate to such an institution, and to furnish meals to all who may see fit to favor them with their patronage, in the old fashioned New England style, the proceeds of which will go to the fund which is now being raised to erect a permanent building, suitable for a Seaman's Home, on the society's lot.

It is expected that the "New England Kitchen" will be one of the features among the amusements in this city for the coming two months. The entertainments will consist of a reproduction of the manners, customs and costumes of the last century, and to illustrate, as far as possible, the domestic life and habits of the people through whose instrumentality our country has attained its present exalted position among the nations of the world.

The object cannot but commend itself to every philanthropist, as its basis is *universal benevolence*, without reference to sect or country. Social gatherings of the olden time will form an attractive feature in the kitchen, viz: the "spinning bee," apple paring, donation party, singing school, wedding party, etc., etc. The room will be of ample size for the accomodation of a large number of guests, for whose entertainment the best of materials, cooked in the best manner, will be served during the continuance of the Fair; and, among many others, the following dishes peculiar to New England: Pumpkin, Apple and Chicken Pies, Indian Puddings, Pork and Beans, Brown Bread, Cider, Apple Sauce, Johnny Cake, Doughnuts, etc., etc. In order to give a truthful and life-like representation of the times of our ancestors, the Committee have been at great expense in fitting up the necessary arrangements, and therefore ask from their friends, donations, or loans of relics, jewelry, wearing apparel, furniture and whatever they may be able to find of ancient date. There are also needed for the table raw and cooked materials. Cash contributions, which may be enclosed to Mrs. C. E. Cogswell, Treasurer, No. 610 Front street, will be thankfully received. Friends, either in the city or country, sending contributions, will please have them plainly marked "New England Kitchen" corner of Eighth and Mission streets. Communications may be addressed to the "New England Kitchen," corner of Eighth and Mission streets, and notices of contributions so addressed will be called for.

Wells, Fargo & Co.'s Express will convey all contributions from the country free of charge.

A COMPANY is preparing to commence the manufacture of glass on Bear creek, Placer county, not far from Wheatland. That creek supplies inexhaustible quantities of pure, white sand, well adapted to the purpose.

THE locomotive for the South Bay railroad has arrived at Eureka, Humboldt county. It is of sixty horse-power, cost $7,000, and is capable of hauling 150,000 feet of logs per day.

THE tunnel and trestle-work of the Lake Tahoe narrow gauge road are now completed, and before the end of the present month the cars will be running over it.

Something Reliable From the Black Hills.

There is some gold in the Black Hills after all, for as we write a small parcel of yellow dust from that locality lies on the desk beside us. It is a modest looking package, containing twenty or thirty pretty coarse pieces of gold, very similar to that found in our old placer mines. It was sent to us by a reliable gentleman, who is now in the Black Hills, and who is a relative of one of the proprietors of this journal. The information he sends, though not intended for publication, will be of interest to those who have thought about the Black Hills, as it comes from a disinterested party and is the result of personal observation. The letter accompanying the gold is dated July 18th.

He says he got into the Black Hills June 3d, and established camp on Beaver creek, west side of the Black Hills, in latitude 43° 49′ 40″, longitude 104° 19′ 30″. He gives the details of the command with which he is connected, and states that Professor Jenney has charge of the mineralogists, geologists, miners, topographers, "hug hunters," and quite a number of old California '49 miners, the latter of whom expected to pick up gold as they did in California in the days of '49. Thus far they have been disappointed.

On June 9th, a part of the command marched for French creek, near Harney's peak, where the miners had established a camp last winter, but were taken out of the Hills by Capt. Mix, 2d cavalry, on order of General Sheridan. The part of the command which went, found gold and sent for the rest of the party. When they arrived they found the party, miners, officers and men, panning for gold. They realized from *twenty-five to fifty cents per day*. Our informant worked three days to get a sample to send to his friends. The small sample sent to us is the proceeds of one day's hard labor, and our friend states that he has ceased to be a miner unless something richer is struck than has been found yet. He says, however, that it is stated that Professor Jenney has struck richer diggings on Spring creek, and two companies started for there on the day the letter was written.

Our informant's description of the Black Hills country is as follows: "The Hills are a cluster of mountains situated out on the plains all by themselves, and are supposed to occupy a space of about 140 miles north and south and 85 to 90 miles east and west. The altitude of Harney's peak, (eight miles south of the camp), is said to be 9,000 feet. The lowest levels are from 4,000 to 5,000 feet elevation. The country of the Black Hills is a beautiful one. Very high mountains interspersed with valleys from a quarter of a mile to three miles and a half in width, bounded by rocky ridges with splendid pine timber along the base and hillsides, giving it an appearance as if the groves were planted to improve the landscape. There are beautiful streams of clear cold spring water running through the grass covered valleys. There are no brambles or underbrush in these valleys, which are as smooth as meadows regularly mown. This will never make a good farming country, as the summer is too short and the climate too cold. (Blankets and buffalo robes are needed to sleep comfortably at night now—July 18th.) It will make a fine stock raising country, as the grass is very nutricious and water so plenty and good. Shelter can be found in the deep canons and valleys. The larger part of the timber is pine, which grows to an immense hight.

"As for gold," says our informant, "we have given it a thorough test, and thus far it has not been found in paying quantities. Of course we have not explored all the Hills, but this vicinity was supposed to be the richest, and was accordingly thoroughly prospected."

Any of our readers who would like to examine the character of the gold from the Black Hills, can do so by calling at our editorial rooms, 414 Clay street; but we fear they will be disappointed at the small amount realized from a day's work.

In addition to what we have said above, we append an Associated Press dispatch, dated Cheyenne, August 10th, which speaks for itself as follows:

General Crook and Colonel Stanton returned here to-day from the Black Hills. Miners were preparing to leave, and were covering up the richest leads, to prevent their being jumped until such time as they can return. The country is said to be rich in gold, and the mountains are supposed to be full of quartz. It is believed that capital and skilled labor will develop mines equal to those of Colorado and Nevada. There were about 1,500 miners in the Hills, and a great deal of preliminary work had been done in the way of ditches and sluices. There were no Indians in that region, and but few had been seen; but those at the agencies are still demanding that the miners be driven out. Some gold was panned out in the presence of the party, which yielded seventy-five cents to the pan. There is an abundance of water and grass, also of timber for building. A town called Stonewall has been laid out on Custar's gulch, in the vicinity of which some rich diggings are located. The whole country is said to be well adapted to grazing and farming. Troops are now en route to establish a temporary post near Stonewall, for the purpose of keeping out miners. Professor Jenney's party were still exploring the Hills, and will probably remain until the middle of October. General Crook and party had fine hunting on Spring Rapid, Elk and Box-Elder creeks, taking a large number of red deer, elk and mountain sheep. General Crook leaves to-morrow, for Omaha."

Montana Scenery.

Although the traveling facilities for reaching the Yellowstone country in Montana are not yet such as to induce tourists to visit the National Park, the general public know pretty well what is in store for them in that wonderful region. The scenery, as described by Prof. Hayden and his assistants in the government expeditions, is magnificent. The peculiar characteristics of the region and the wonderful variety of objects will make it a source of great pleasure to those who are able to visit the country a few years hence, when transportation facilities are arranged.

To those, however, who are unable to make the trip, illustrations and descriptions of striking objects and scenery are acceptable, and we propose giving, from time to time, engravings from the government reports, which will give a good idea of the country. We give in this number a view of the volcanic breccia at the head of Canon and Rock creeks. (Breccia is a geological term, applied to a natural conglomerate consisting of angular fragments of stone united together by some cement, or by infiltrated iron or carbonate of lime.) The divide

Volcanic Breccia at the head of Canon and Rock creeks, Upper Yellowstone, M. T.

between the Yellowstone and the Gallatin is quite sharp and narrow, the numerous little streams cutting deep channels down from the crest to the river. The divide itself is formed entirely of the volcanic conglomerate, weathered into the most singular architectural forms. West of the canon, at the head of Canon and Rock creeks, this conglomerate is at least 1,000 feet thick, horizontally stratified, and worn into hundreds of pinnacles or Gothic columns. Silicified wood is found in these conglomerates in vast quantities, and sometimes huge logs and stumps are exposed in a vertical position in the walls. Dr. Hayden saw, at the head of Canon creek, the stump of a tree which must have been at least fourteen feet in diameter originally. It was firmly enclosed in breccia.

These conglomerates are found sometimes 4,000 or 5,000 feet thick, and some of the highest mountains in the Northwest are capped with these volcanic breccia, arranged in horizontal strata, showing clearly that the agent which formed them was water. Dr. Hayden concludes that at a comparatively modern date the waters so covered the mountain ranges of the Northwest that not even the summits of the loftiest peaks were above the surface. We may suppose that the materials were supplied from the numberless volcanic fissures in unlimited quantities in a comparatively brief space of time; but the period which would be required for the waters to arrange this matter in the remarkably uniform and compact series of strata which is found at the present time, must have been great. The results have been carried on in such a stupendous scale that the mind finds with difficulty the courage to grapple with them or attempt to explain them. And then, subsequent to the deposition of these enormous beds of conglomerates, has been the wearing out of canons and valleys 2,000 to 4,000 feet in depth, the sculpturing of some of the most marvelously grand and unique scenery on the continent. In passing up the valley of the Upper Yellowstone, which is about three miles wide and has been carved out of this hard breccia, one would easily imagine himself in some enchanted land, where, on every side, were castles and palaces without number.

Invention and Progress.

[From Advance Sheet of the Mechanics' Fair Daily.]

It will be a matter of interest to many who have attended former exhibitions of the Institute to examine carefully and in detail improvement, made in any special class of exhibits this year and note the progress made within the past few years. One can, by this means, more fully realize the results of the patient, untiring industry of the inventor, than by reading pages of descriptions of the progress of any special branch of art.

We take these things so much as a matter of course now-a-days, that few people have any idea of the multiplicity of labor-saving improvements which have been invented within the past fifteen or twenty years. Though hundreds of such things are patented which never are put to practical use, a large proportion are of real benefit to the world at large. Even those inventions which are a partial or total failure, are in some degree productive of good, since they keep other inventors from making similar mistakes, and incite them to renewed exertions.

People generally fail to appreciate what a load of labor is taken from their shoulders by the exertions of the inventor. The tools, machinery and appliances of modern days are accepted as matters of course, without much thought as to the ingenuity they present. We wander through a place like the Mechanics' Fair, for instance, and see thousands of things on exhibition, each one of which may have taken years of labor of several men; not for its construction, but for its conception in all its details. We look more at its finish and beauty of construction generally, than at the ingenuity called forth in planning such a thing as a locomotive or steam engine. We must remember, however, that there is a large field still open for the inventor, and that many of our most elaborate and cunning devices will probably be old-fashioned and useless in another century; notwithstanding, our present appliances appear wonderful as compared with those of a few generations past. Invention and progress go hand in hand; as one increases, the other advances. If one is encouraged, the other is sure to follow. This should be remembered by all public-spirited citizens; and instead of snubbing inventors of new things, they should be judiciously encouraged and assisted.

The old Californian has commenced making prophecies in regard to rain the coming winter. He says he has always noticed that when there were floods in the East, and much of rains elsewhere, it was always followed by heavy rains here in winter.

A large amount of stone of superior quality is now being quarried at the Contra Costa quarries.

Service pipes are being laid in San Luis Obispo and the streets will be soon lighted with gas.

Mining Decisions and Patents.

The Commissioner of the General Land Office has made the following decisions on public lands containing valuable deposits:

Kaoline may be patented under the mining acts of Congress.

In the case of the Daney gold and silver mining company vs. the Sapphire silver mining company, it is decided that an application for a patent under a mining act is such an appropriation of the premises therein as takes them out of the operation of local laws, until such application is set aside.

Upon a failure to comply with the requirements of the General Land Office in the completion of title, it cannot be considered waived or forfeited.

In the case of the Crisman vs. the Union Pacific railroad company, it is decided, where parties were in the actual possession and working a coal mine on a railroad section prior to a definite location of such land, it does not pass to the railroad under the grant.

Rights acquired in coal under the Act of March 3d, 1865, are assignable.

The following patents for mining ground have recently been issued:

California—Amador county: J. F. Bradshaw and J. T. Wheeler, Grove Flat, placer. El Dorado county: Richard Doncaster, Jr., Canon creek, placer, and Red Hill quartz mine; Ernest Weber, placer; Charles Caquard *et al.*, Lone Star tunnel, placer; E. L. Parker, Parker hydraulic, placer; J. C. Berry and Joseph Brannan, Manhattan, Empire, Happy Flat and Johnstown creek, placer; Heley gold and silver mining company, Kelsey mine; Peter Watt *et al.*, Woodford & Company's, placer. Inyo county: Bonshey silver mining company, Bonshey silver quartz mine; Wyoming Wonder silver mining company, Wyoming mine; Stewart's Wonder silver mining company, Stewart's Wonder mine. San Bernardino county: Wm. P. Morrison *et al.*, Morrison mine; J. W. Searles *et al.*, Mohawk mine; Ohio and Soledad horse claims. Nevada county: Osborn Hill mining company, Osborn Hill, quartz mine. Placer county: Tabb Mitchell *et al.*, Conrad quartz mine; Wm. Winne Crossens, quartz mine. Calaveras county: Charles W. Smith and N. Palsma, quartz mine. Sierra county: Ludgo Leviche *et al.*, Independent quartz mine.

Colorado—Park county: David A. Moffat, Jr., minerals, lode. Gilpin county: Starr Cooper lode, Rookdale gold mining company; Harsh & Calhoun, lodes; William Richardson, William Richardson lode. Clear Creek county: William Helmer, Dora lode; Charles L. Hoker, Potosi lode; Silver mining, commercial and manufacturing company of Colorado, Jenks lode; J. B. Chaffee, mill site; Wm. P. Liel, Contra lode; S. Wann and G. S. Bowdern, placer; J. D. Ford *et al.*, Seaton lode; George R. Morehouse, Sterling lode; Trenton gold and silver mining company, lode. Park county: Frederick C. Morse, Claner lode. Boulder county: T. J. Graham and Keystone silver mining company.

Nevada—White Pine county: George Thomas, Grant and Colfax lode. Storey county: Ward gold and silver mining company, Ward lode. Lyon county: C. E. DeLong *et al.*, Columbia lode; Lonis Goldstone *et al.*, Grant lode; Sapphire mining company, Dois Senor or Manlet lode. Eureka county: S. Wenhan, St. Louis, Idaho, Garrison and Arctic lodes.

Utah—Salt Lake county: J. N. Whitney *et al.*, Aladdin lode; Isidor Morris, Ashland, No. 2. Iron county, S. M. Blair *et al.*, Iron May claim. Tooele county: Mount Gibson and Noyes mines.

Progress in the Sutro Tunnel.

The following is the report of progress in the Sutro tunnel, for week ending August 8, 1875:

Number of feet in tunnel, August 1	10,296
Number of feet driven during week	117
Distance in, August 8	10,413

Details of work performed are as follows, heading being 8x10 feet:

Holes drilled	364
Holes blasted	370
Aggregate depth	2,548 feet
Average depth	7 feet
Powder consumed	1,071 lbs
Exploders consumed	370
Rock extracted	1,488 tons

Rock — Conglomerate of porphyry; good drilling and blasting.

Water—Thirty-one miner's inches flowing.

Remarks—Average progress per day, 16.7 feet, the best week's progress ever made. Total delays laying track, etc., twelve hours.

[Signed] A. Sutro, Gen. Supt.

An explosion occurred in the laboratory of the U. S. arsenal at Bridersburg, P., last Saturday, resulting in the death of two persons and the wounding of about thirty others.

A special freight train loaded with tea started overland from this city on Friday of last week. It will go through to New York in 12 days.

A fast mail train from New York to Chicago is soon to be started, which will make the distance in 24 instead of 36 hours as at present.

Col. McAllister's yacht, the *Admiral*, was launched at the Mare Island navy yard last week.

Cars are running regularly on the street railroad in Santa Cruz.

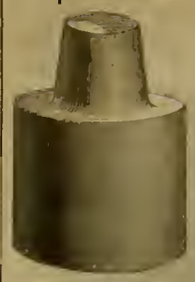
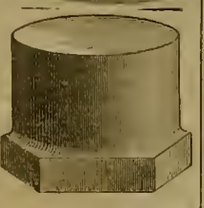
Improved Cast and Forged Steel Shoes and Dies for Quartz Mills.





[PATENTED MAY 26TH, 1874.]

Price Rednced to 16 Cents Per Pound.

SAN FRANCISCO, November 10th, 1874.

To Supts. of Quartz Mills and Mining Men generally:

We take pleasure in stating that owing to the rapid increase in our orders, our Pittsburg Manufacturers have been compelled to add largely to their works—a new gas furnace and heavier trip hammer—and are thus enabled to reduce the cost of steel and at the same time produce SHOES AND DIES superior to any yet manufactured. We have consequently reduced the price to 16 cents per pound and solicit a trial order, guaranteeing that you will find them at least 10 per cent. cheaper than the best iron. There are no STEEL SHOES AND DIES made excepting under our patent and sold at this office, or by our authorized agents, though certain Eastern manufacturers advertise STEEL SHOES AND DIES which are only cast iron hardened by the addition of a composition. They will not out-wear two sets of common iron, though called steel. They are very brittle and are not capable of being tempered, flying from under the hammer like cast iron. Our STEEL SHOES AND DIES are in use in many of the largest mills on the Pacific Coast, and all who have tried them pronounce them cheaper and far superior to iron in every respect, even at the old price of 20 cents per pound. The advantages over iron are cheapness on first cost, increased crushing capacity, time saved in changing and in setting tappets, increased value of amalgam by absence of iron dust and chippings, and a saving of 75 per cent. in freight. It takes 50 days to fill orders from the manufactory East. Price 16 cents per pound shipped at San Francisco. Terms liberal.

Address all orders, with dimensions, to

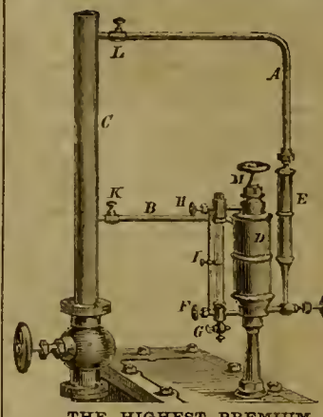
N. Seibert's Eureka Lubricators.



THE HIGHEST PREMIUM

Awarded by the Mechanics' Institute Fair, San Francisco, and State Fair, Sacramento, 1871.

These Lubricators are acknowledged by all engineers to be superior to any they have ever used; feed constantly by pressure of condensed water supplied by pipe A, regulated under the oil by valve J, and forced out through check valve and pipe B into the steam pipe C; it then becomes greasy steam, passes to all the valves and cylinder at every stroke of the engine; glass tube I indicates amount used per hour. Packing on rods and stems lasts longer, and the rings on the piston will not corrode. One pint of oil will last from three to six days, according to speed and size of engine; I, sliding gauge; K, valve to shut off when engine stopps; H, F, valves to shut off in case of frost; steam does not enter the cup; it is always cool; warranted to give satisfaction. Patented February 14, 1871. Manufactured by California Brass Works, 125 First street, S. F. 24v23

Calculating the Speed of Railway Travel.

Travelers on railways are often desirous of knowing the speed at which they are moving, and, as a general thing, are not aware that with the aid of a watch they may readily do so, even when mile posts are not placed along the track. This may he done hy simply counting the nnmber of rails which are pessed over in any given minute. On the best laid roads the hammering sound made hy the wheels in passing from one rail to another is qnite endihle, and may he easily noted on which ever side of the car the observer may he sitting. All rails are either twenty-four or thirty feet in length; the length of the rail on which you are traveling may he ascertained hy pacing, or hy measuring with e pocket rule at any station where the train stops. Then by counting the nnmher of rails passed in thirty or sixty seconds, and consulting the subjoined table, yon can readily calculate the speed at which yon are traveling. When a train moves 14.67 feet in a second, it is traveling at the rete of 10 miles an hour, or a mile in 6 minntes. The following table gives data for different rates of movement, and will he readily understood. The first column indicates the nnmher of miles per hour, the second the corresponding nnmber of feet per second, and the third the time occupied at that rate in running one mile:

Miles per hour.	Feet per second.	Minntes per mile.
10	14.67	6.00
12	17 60	5.00
15	22.00	4.00
18	26.40	3.20
20	29.33	3.00
25	36.67	2.29
30	44.40	2.00
32	46.93	1.55
34	49.87	1.46
36	52.80	1.40
38	55.73	1.35
40	58.67	1.30
42	61.60	1.26
44	64.53	1.22
46	67.47	1.13
48	70.40	1.75
50	73.33	1.12
52	76.27	1.09
54	79.20	1.07
56	$2.13	1.04
58	$5.07	1.02
60	$8.00	1.00

General News Items.

A FRIGHTFUL accident occurred at Woodward's Gardens on Snnday last. A tier of seats erected near the bear pit gave wey and the occupants together with the debris of timber fell npon a crowd of people nnderneath, who were looking et the hears. One man was mortally wonnded, two women had legs hroken, and a nnmber of persons were injured more or less.

IT is the general helief that ex-Senator Finney was murdered, as the presumption is strongly against suicide, and he is known to have been threatened by a party of desperadoes whom he had prosecuted.

THE jury in the case of John D. Lee have disagreed. Eight Mormons and one Gentile for acquittal, three Gentiles for conviction.

JOSEPH A., eldest son of Brigham Young, is dead. He leaves four wives and a proportionate nnmber of children.

CHARLES KUCHEL, the defaulting stock hroker, has heen held to hail in $40,000, to await the action of the grand jury.

Two yonng ladies, while hathing in front of Cave of the Winds, et Niagara Falls, last Tuesday, were swept into the rapids and drowned.

THE number of through passengers over the Central Pacific in the month of July was: East, 2,842; West, 5,709. Total, 8,552.

A RIVALRY betweeu competing lines has reduced the rate of fare between Kansas City and New York to $20.

THE committee of J. B. Ford & Co.'s creditors recommend a compromise at 35 cents on the dollar.

SEVERAL riots occurred in London and Dnhlin during the celehration of the O'Connell centennial last week.

JACK COTTON has been incarcerated in the State prison for life, for the murder of Mr. Norton.

THE American rifle team will meet with a grand reception on their return to New York.

CARDINAL McCLOSKY has gone to Rome.

MR. WM. H. MARTIN, of the Union Emigrant company, has left San Francisco for Philadelphie, where he will spend ten days in making the necessary preliminary arrangements for the erection of a building at Fairmount Park, on the grounds which have been allotted, separate from the general Exposition buildings, to that company, for the exhihition of the natural and artificial products of California at the Centennial. He will afterwards visit Paterson, New Jersey, and other points where colonies are organizing to emigrate to California nnder this company's anspices.

A NEW ENTERPRISE.—We are pleased to learn hy the San Jose *Mercury* that articles of incorporation of the Angora Rohe and Glove company have been filed in the office of the Secretary of State. Capital stock $50,000, in shares of $100. Directors. J. W. Hinds, Jackson Lewis, Lewis & McCracken, H. T. Welch, G. T. Brown and Return Roherte.

SACRAMENTO G. M. Co.—August 11. Location: Sierra county. Capital, $5,000,000, in shares of $100 each. Directors, Charles McCreary, James A. Duffy, John Black, James G. Chesley and M. Cronan.

NO USE of any longer taking the large, repulsive, griping, drastic and nauseous pills, composed of crude and hnlky ingredients, and pnt up in cheap wood or pasteboard boxes, when we can, by a careful application of chemical science, extract all the cathartic and other medicinal properties from the most valuable roots and herhs, and concentrate them into a minnte Granule, scarcely larger than a mnstard seed, that can be readily swallowed hy those of the most sensitive stomachs and fastidions tastes. Each of Dr. Pierce's Pleasant Purgative Pellets represents, in a most concentrated form, as mnch cathartic power as is embodied in any of the large pills found for sale in the drug stores. From their wonderful cathartic power, in proportion to their size, people who have not tried them are apt to suppose that they are harsh or drastic in effect, hnt such is not at all the case, the different active medicinal principles of which they are composed being so harmonized, one hy the others, as to produce a most searching and thorongh, yet gently and kindly operating cathartic. The Pellets are sold hy dealers in medicines.—*Com.*

THE SCIENTIFIC PRESS.—This valnable journal entered npon the seventeenth year of its pnblication on the 4th of July. The steady advance in character, that every reader has noticed in the paper, renders it unnecessary to make any splurge of improvement, and the publishers simply content themselves with the announcement that they will continne to make their paper as interesting as possihle. That it is interesting to a large class of readers, the wide circulation and extensive infinence of the PRESS, is sufficient evidence.—*Placer Argus.*

THE
MECHANICS' FAIR DAILY

—OF THE—

TENTH INDUSTRIAL EXHIBITION

[Circulation Free]

Will be a superior pnblication, and contain all

Official Information

During the Exhibition, commencing Ang. 17th, 1875,

Its Illustrations

Will furnish accnrate views of

New Inventions and Machinery.

The volnme will give a substantial and readable

Record of the Fair,

Qnite valuable for reference and preservation, in addition to a goodly variety of other reading matter, daily, embracing

Graphic Paragraphs and Humorous Incidents,

Making altogether a paper eagerly songht for (both in and ont of the Pavilion) hy nearly a

Quarter of a Million of Readers!

During the term of the Exhibition—a circnlation reaching a greater number of different individuals than that of any pnblication yet issned. We shall make a specialty of inserting

Attractive Advertisements,

Representing the leading firms in nearly

Every Branch of Trade and Industry

On this coast, upon favorable terms, soliciting such as we believe will be most benefited hy advertising in a well condncted, enterprising and everywise meritorious journal. We issue

An Advance Edition of Ten Thousand Copies

Of the first nnmber to be circnlated gratuitonsly

All Over the Pacific Coast

In advance of the opening of the Fair, including 5,000 in San Francisco, August 16th.

This beautifully illustrated sheet, issued npon snch an occasion will receive close attention, and its contents—both reading and advertising being original—will be closely scanned throughout.

The Immense Pavilion

Has been enlarged for the coming Fair. An unnsually large amount of space for exhibits has already been engaged. Stimulated hy the list of preminms offered this year the exhibition will donbtless be a

Grand Success.

Orders for advertising, sent in early, will receive careful attention.

The undersigned pnblishers of the MINING AND SCIENTIFIC PRESS have successfully issued a popular daily in the Mechanics' Fair during six Indnstrial Exhibitions since 1864, and we are now confident of making the coming volume surpass all its predecessors in its standard of valne as a reading journal of art and information and a medium of first-class business announcements.

We have been awarded hy the managers of the Exhibition, the

Exclusive Publishing and Advertising Privileges

Of the Tenth Indnstrial Exhibition, and are determined to accomplish a work creditible to the MECHANICS' INSTITUTE, TO OUR PATRONS, AND TO OURSELVES.

Tenth Industrial Exhibition of the Mechanics' Institute, S. F., 1875.

PRELIMINARY ANNOUNCEMENT.

The Board of Managers of the Tenth Industrial Exhibition have the pleasure of announcing that an Industrial Exhibition will be held, under the auspices of the Mechanics' Institute, in the city of San Francisco, to be opened on Tuesday, the 17th of August, 1875, at 11 A. M., and to continue open at least one month thereafter.

In making this public announcement, the Managers desire that those who intend to exhibit should send in their applications for space as early as possible, so as to avoid the necessity of excluding, as has been the case heretofore, the many desirable exhibitors who are unusually tardy in making applications.

The forthcoming Industrial Exhibition will be the tenth held under the auspices of the Mechanics' Institute, and the Managers are justified in saying that it will undoubtedly surpass in completeness of detail and general arrangement any heretofore held.

The last Exhibition was attended by 700,000 visitors, attracted hither by the fame of these Industrial Fairs, and for the purpose of investigation, business and pleasure.

All the available exhibiting space was applied for several weeks before the day of opening, and the Managers were compelled to deny admission to many desirable exhibits.

The Board of Managers desire particularly that the arts, the industries and natural products of the country should be well represented at the forthcoming exhibition, and no pains will be spared to make these classes of exhibits a special feature there.

The Exhibition will be held in the building constructed for that purpose in 1874, but it will be materially enlarged and improved in many details for the Exhibition of 1875.

The space under roof will exceed 180,000 square feet, or about four and a half acres, exclusive of the Horticultural Garden, which will occupy 24,500 square feet additional.

The location of the Exhibition Building, on Eighth street, between Market and Mission streets, cannot be surpassed for convenience and accessibility, and can be approached from every part of the city by means of the various lines of street railroads, any of which bring visitors within two blocks of the entrance gate.

The utmost care has been exercised in providing for ample ventilation and light, and during the evening the building is brilliantly illuminated by over 5,000 gas lights.

The promenade avenues are broad, and 3,000 seats are provided for the comfort of visitors, for whose convenience there is also an excellent restaurant, under the management of a first-class restaurateur.

Every afternoon and evening the best orchestra the city can supply will discourse excellent music under the direction of an accomplished leader.

The building is always well attended by visitors, and during the last Exhibition over 29,000 were daily admitted for a number of days, and under no similar circumstances can the manufacturer, the mechanic, the inventor, producer or business man so advantageously place himself before the people of the Pacific Coast.

Persons desiring to obtain information, or to make application for space, should address "Managers of Tenth Industrial Exhibition, San Francisco, California," or make personal application as below.

It is expected that the various transportation companies will convey goods intended in good faith for exhibition, at half the usual rates.

Exhibitors from abroad, if they have no agent or consignee in San Francisco, can consign goods and mark the same to the "Manager of the Tenth Industrial Exhibition, 17 Post street, San Francisco," and they will be stored, if they arrive before the day of opening, free of expense; but no charges or expenses for or freight or forwarding, etc., will be paid by the Managers.

In order to secure space, application should be made on or before

Blanks will be furnished on application.

Premiums will be awarded as follows, viz: 16 gold medals, 50 silver medals, Society Diplomas, Certificates of Merit and Special Premiums, as the Board may determine.

Blanks for space can be obtained at the Mechanics' Institute on application by letter or otherwise; and any information will be given, by applying to any member of the Board of Managers, as below:

A. S. HALLIDIE	113 Pine street.
JAMES C. PATRICK	122 Battery street.
HENRY L. DAVIS	421 California street.
D. E. HAYES	213 Fremont street.
ASA R. WELLS	Mechanics' Mill.
P. B. CORNWALL	Cor. Spear & Harrison streets.
CHAS. ELLIOT	516 California street.
GEORGE SPAULDING	414 Clay street
W. P. STOUT	604 Merchant street.
J. H. STOPPENBOROUGH	111 California street.
R. B. WOODWARD	Woodward's Gardens.
JAMES SPIERS	311 Howard street.
H. S. SMITH	Ætna Iron Works,
JEREMIAH BROWNING	110 Pine street.

To the Librarian of the Mechanics' Institute, or to J. H. CULVER, Secretary, 27 Post street, S. F.

Rules and Regulations of the Tenth Industrial Exhibition, Mechanics' Institute, S. F., 1875.

1. The Pavilion will be open for the reception of goods on Monday, August 2d. The exhibition will be open to the public on Tuesday, August 17th, at 11 o'clock A. M.

2. Applications for space must be made on or before stating character of exhibit, amount and kind of space required—wall, table or floor. And, if cases, state length, width and hight of case. Blanks will be furnished for this purpose, and a clerk will be in attendance at the Library of the Mechanics' Institute, every day from 12 to 1, and 7 to 10 P. M.

3. All persons presenting articles for exhibition must have them registered by the Receiving Clerk, who will give a receipt for the same, which receipt must be presented when the articles are withdrawn, at the close of the Exhibition.

4. Judges will be appointed by the Board of Managers, immediately upon the opening of the Exhibition, to examine all articles presented, in accordance with Article III, and the Managers will award premiums on such articles as the judges shall declare are worthy, which will be delivered as soon as they can be prepared. Due notice will be given of the announcement of premiums.

5. The mornings of each day, until 10 o'clock, will be appropriated to the Judges, and no visitors will be admitted during the time thus appropriated, except at the special request of the Judges, or by permission of the Managers.

6. Articles intended for sale may be labeled accordingly, but cannot be removed until the close of the Exhibition, except by written permission of the Managers.

7. Steam power will be provided, so that machinery of all kinds may be seen in actual operation, and every facility possible will be given to exhibit working machinery to the best advantage.

8. The name of every article must be attached by the exhibitor to it.

9. Articles intended for exhibition must be entered and placed on exhibition on or before Saturday, August 21st.

10. Perishable articles will be received, or may be removed at any time during the exhibition, with the consent of the Managers.

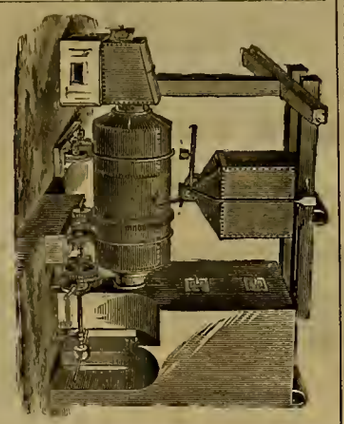
11. The most effectual means will be taken, through the agency of the Police and otherwise, to guard and protect the property on exhibition; and it will be the purpose of the managers that all articles shall be returned to the owners without loss or injury. Still, all articles deposited will be at the RISK OF THE OWNERS.

12. In case of any misunderstanding, application may be made to the Managers, who will at all times be in attendance.

13. The Managers are desirous that articles should be presented early. Those from abroad, intended for exhibition, should be properly packed, and if not consigned to exhibitor's agent, must be marked, "MANAGERS OF TENTH INDUSTRIAL EXHIBITION, SAN FRANCISCO, CAL." All articles thus received, arriving too early, will be stored free of cost to the exhibitor, and the Managers will have them duly placed in proper position for exhibition. No freight charges will be paid by the Managers; but exhibitors are notified that arrangements are being made with various transportation companies to repay freight charges on evidence of goods exhibited.

Information will be furnished by addressing MANAGERS OF TENTH INDUSTRIAL EXHIBITION, SAN FRANCISCO, CAL.

TEATS' PATENT FURNACE.



TEATS' PATENT FURNACE

For Roasting, Desulphurizing, Chloridizing and Oxidizing Ores, etc. For the reduction of Gold, Silver, Lead and other ores, saving a larger percentage, at less cost, than any other invention now in use. Chloridizing Silver ore more thoroughly, in less time, with less fuel, salt and labor; also roasting Lead ore preparatory to smelting, better and cheaper than any other invention. The Furnace is so constructed that one man, of ordinary ability, tends five or more furnaces; controls them with ease; adding heat or air; stopping or starting at will; charging and discharging with ease. Also, Patent "Conveying Coolor," for conveying and cooling roasted ores, heating the water for amalgamation and the boilers at the same time. Saving the large space in mill (covered with brick or iron), and the labor of two men per day, exposed to the poisonous chlorine gases. Also, Patent Air Blast "Dry Kiln," for drying ores direct from the mine or breaker, saving fuel and labor heretofore necessary in drying ores for dry pulverizing. For description refer to MINING AND SCIENTIFIC PRESS, No. 18, October 31, 1874. For particulars address

D. B. MILLER & CO.,

No. 12 West Eighth Street, Cincinnati, Ohio

Circulars, &c., will be furnished, if required.

VOLUME XXX. Number 8.

Co-Operative Mining.

When one travels through the mining conn-es of California, and sees the large number of ines that would be remunerative to labor and apital, and then again, the large number of ble-bodied idle men, we wonder why is that some system is not brought ont, that will give activity to the any dormant localities, and make rosperous the communities, while so nch riches ars within their reach. What country on earth spreads rth such a field for the industrious an as California? Her soil not nly can supply the necesseries of e, but untold gold and silver is ithin the reach of the industrious. nt, some say, we have not the capi-l. There are two equals of capital, z.: brains to contrive, and hands labor, and to our mind, the o latter are the main requisites to en a prosperous period in every lo-lity.

The brains we would engage, in rming organizations for co-opera-ve labor, and when that is formed, apital can be found, because labor comes the best of collateral for it. very man of means in our moun-in towns know, (if he is possessed ly of ordinary business judgment) at to aid legitimate enterprises, ie ilding up his own interest. So that oper combinations of labor is a mbination of labor and capital.

Co-operative organizations for min-g is no particular new idea, but hat we ask for, is, that it may be-me a more general one. That this ust be the course our honest, but orer miner must adopt, is quite ident, otherwise he must expect s day labor to fall to the standard—China rates—and for the reason, at the Chinaman is becoming expe-enced and will work.

We must say, that in view of the rge influx of this Asiatic labor, now ting at about 30,000 a year, that the tlook for the white laborer or iner who works for weges, is by no eans cheering. We therefore won-r why there is not more enterprise hibited in combining white labor to co-operetive organizations for ining, and we meen especially, uartz mining.

Organizations of this kind, with od executive heads, could accom-ish much for themselves and the ate, and bring the present evil of ina labor to a benefit for them-lves, while it is now especially for pital. While the idea is urged, it ay be well to suggest a simple plan. In every locality there are quartz ines which half a dozen or more n, and which, if necessary, as any more could be found to have ith in, divide this up into working terests of such an extent as to in-re complete development. This la-r being organized, then seek and ing only enough capital into the terprise to keep up the running penses, without counting labor. his accomplished, develop the prop-ty, lay upon the surface one, two or e hundred tons of ore; then your bor readily commends capital for ther mills or the mine. As things w are, the man who owns the mining prop-ty if poor, starves himself out holding on, and pital only offers a pittance for tens of thou-nds in value when developed.

Capitel thus rules, while adopting the co-op-etive plen, labor would rule and meet its llest reward. This we give as simply the out-ne of what may be worked up into a plan of -operative mining of great profit to the work-g miners of our State.

A NEW stove manufactory has been estab-shed in Santa Rosa.

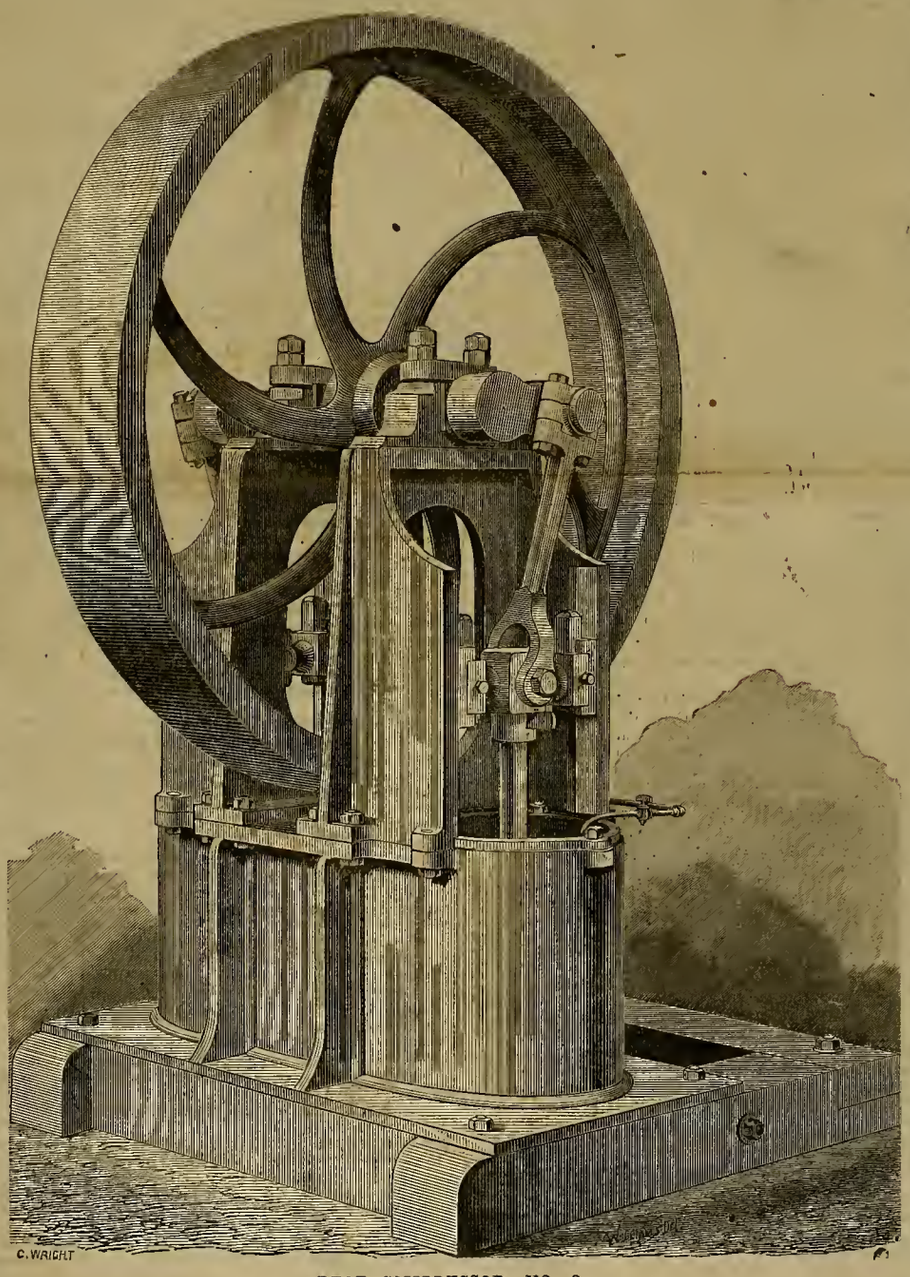
A NOVEL NEWSPAPER ENTERPRISE.—It is said that the London *Times* has in contemplation a plan for printing its sheets simultaneously in several of the great towns, in order to hold its position with its country readers, which it is fast losing by reason of the enterprise of some of the leading local interior papers. The plan proposed is an electrical type setting machine to be operated in London, but which shall set up the types in as many different localities as it shall be found desirable to do so. The *Times* is testing the practicability of the scheme, and the result is looked for with much interest.

IT is reported that work will soon be commenced on the extension of the Donahue road from Fulton to Guerneville, and also on the extension from Donahue to Swift's point, at the mouth of Petaluma creek.

CLAIM REJECTED.—A dispatch from Washington under date of August 14th, says that the Commissioner of the General Land Office has rejected the claim of the State of Nevada to the southeast quarter of section four, township nineteen north, range fifty-five west, in Eureka district; and so much of the homestead claim of Robert Meinka as conflicts with the mill site of the Nevada mill and mining company.

A WINE cellar is to be built in Sonoma county this fall, with a capacity of 200,000 gallons. The size will be 65x110 feet. It will be three stories; two stories of fifteen feet each will be cut in the sand stone ledge, and the upper story will be built of wood.

A CRACKER manufactory has been started in San Diego.



BELT COMPRESSOR, NO. 2.

Now on exhibition at the Mechanics' Institute Fair. For description see page 120.

Paul's Dry Process.

We are creditably informed that this system of working gold and silver ores, is now operating to such a degree of perfection that at an additional expense of about $1.50 per ton, over our common California wet working, that from eighty-five to ninety per cent. of all the value of the ores is very easily and practically obtained.

We would be glad to give our readers full particulars as to all the later improvements, but Mr. Paul does not seem inclined to say much about it further than that a mill of capacity to work ten tons a day is now being built for the Forbestown mining company, who expended considerable time and money in practically testing the process, and that he is willing to let this mill when completed, do the talking. Besides he says our California quartz miners are happy in their "chcap" way of working, and that it is only the few enterprising ones who want improvements, and that they will go to the mill when built, see its operations, and judge for themselves.

The tests made by the company erecting this mill were so extraordinary, and so completely confirmed Mr. Paul's representations as to what his plan of working would do, that they are sparing no amount of capital in having the most perfect mill that can be built. How soon it will be ready to run, we cannot now state, but will ascertain and advise our mining readers.

We have expressed our faith in the idea of manipulating ores dry, for obtaining a high per centage of the precious metal, and will look for the results of this operation, with more than usual interest, for the reason, that Mr. Paul declares his labor on both process and machinery is ended, and that this mill will embody the system in all its simplicity and perfection.

MINING FIRE BRIGADES.—The Gold Hill *News* suggests the expediency of organizing fire brigades attached to each mine, with the proper hydrants, hose and apperatus for extinguishing any accidental conflegration. At the Crown Point, Belcher, Yellow Jacket and others of the principal mines, such arrangements have existed for some years. For instance, in case of a fire at either of the mining works mentioned, so well organized and on the alert are the respective fire brigades, with their hose on reels at the hydrants, that within seven minutes from the time the alerm is sounded they can have half a dozen streams playing over or into any of the buildings coonected with the works. It seems almost impossible that any seriously destructive conflagration can occur in the face of such preparations and vigilance. Not only should the best and most effective apparatus be provided, but it should be kept in perfect order for immediate use, and the men should be constantly well drilled and ready for any emergency. It is a particularly well demonstrated fact that the fire extinguishing arrangements of the Imperial-Empire hoisting works saved the buildings and perhaps the shaft, from total destruction.

THE project of carrying water into Santa Monica from the Vincinte springs is being steadily pushed forward. The ditch is already dug and the contract for the pipes has been given out.

THE grading of the road from Galt to Ione valley has been completed as far as Buckeye, six miles from Ione City.

CORRESPONDENCE.

Hydraulic Gold Mining.

[No. 2.—Written by C. J. BROWN, for the PRESS.]

In article No. 1, on this subject, in the PRESS of Jnly 24th, I stated that my principal object in writing these letters was to give a statement of the progress of mining at this place and vicinity. Progress presupposes obstacles, and in order to give the readers of the PRESS a true and comprehensive idea of the progress of this kind of mining in any given locality, the obstacles with which the miner has to contend should also be discussed. The first and most noticeable obstacle is the ignorance of the miners of even the rudiments of geology, few of them being able to tell whether a given boulder is crystalline, sedimentary or igneous; or whether a certain stratum in the mines is true washed gravel or otherwise; and when informed that the waters of the South Blue flowed north, they doubt the sanity of their informant, and reply "water don't run up hill." It would be as fruitless for me to estimate the amount of money wasted in absurd and foolish mining enterprises as to estimate the value of hopes crushed, anticipations and exertions doomed, from the first, to inexorable disappointment and defeat, all owing to a deplorable lack of—what would be termed in every other business—common sense. But there are other formidable obstacles to be met and overcome, and only the intelligent and thinking, persevering miner can remove them with success. I will give an example of a failure, and the reasons for it further on.

I will confine myself, for the present, to a section of the South Blue from Indiana hill on the south to Thompson's hill on the north, and its tributary, known as the Dutch Flat channel, from the latter place eastward one mile, in all, six linear miles of these two channels of ancient rivers long since extinct. Twenty years ago they were filled and overspread with auriferous gravel to a depth of from three hundred and fifty to five hundred feet, upon which grew a forest of gigantic pines.

It will be observed that I locate this section of mining lands on the divide between the north fork of the American river and Bear river, in Placer county, and that the Central Pacific railroad crosses it between Gold Run and Dutch Flat at an altitude of three thousand four hundred and twenty feet above the sea.

As the South Blue ran its waters toward the north, Indiana hill (which is one mile southeast of Gold Run,) is located on the inlet, and Thompson's hill, (one mile west of Dutch Flat), on the outlet of its old channel across the divide. I use the words inlet and outlet, because to the south of Indiana hill, the north fork of the American river has crossed the South Blue and cut a canon to a perpendicular depth of fifteen hundred feet below the old channel, completely obliterating all evidence of its former existence between the latter place and Iowa Hill, a distance of four or five miles, and to the north of Thompson's hill, Bear river crossed it in like manner and cut a canon to a perpendicular depth of one thousand feet below its channel, destroying about two miles of it.

In my first letter I also called the attention of the reader to the fact, that at Indiana hill, the South Blue left the middle slate stratum and turned its course to the eastward on to the trap rock, over which it ran to near the town of Little York, in Nevada county.

Trap is an igneous rock, fine as iron, hard and very tough. A stream flowing across it cuts a narrow and steep canon for its channel, as witness the stupendous gorge of the north fork of the American river where it crosses this same stratum with its walls standing almost perpendicular, in bold, barren and rugged relief and picturesque grandeur, at a hight of two thousand feet above the river. So, too, the South Blue, along this stratum of rock, wore its channel deep and narrow, and the eastern wall of its canon stood high and precipitous.

During the slow upheaval of the Sierra Nevada, and after the old river channels here had filled with gravel to the hight of fifty feet or more, this wall of trap was precipitated into the ancient streams of the South Blue and the Dutch Flat. This slide was probably caused by the lateral pressure of the mountain as it arose, aided by an earthquake convulsion, as it has the appearance of being a sudden and formidable drift with a momentum which forced it far over upon the slate at Little York, and no doubt beyond, for it now shows several feet thick at the latter place; it appears in patches at Indiana hill, where the old river first entered upon the trap bed-rock, as before mentioned, and it still overlies the first, or what is called the blue gravel deposit, along nearly the whole extent of this section of hydraulic mining ground, from ten to eighty or ninety feet in depth; deepest near the western rim rock or side of the channel toward which it slid. When first deposited, it was of course, much deeper than at present, for the waters came upon and overflowed it, cutting down channels into it, and washed away the lighter surface material, leaving a non-gold-producing stratum of angular, unwater-worn gravel, which was, in time, deeply buried beneath a deposit known among miners as the red gravel banks. Of course this trap slide contains many boulders apparently water-worn, but to an observant eye it is plainly distinguished from the true gravel deposits.

This slide has been a serious obstacle to successful mining operations along this section because miners have been and are, to some extent, still ignorant of its true nature, and those, and those only, who comprehend its character and work it accordingly as they would a bank of pipe-clay or any other barren and vexatious incumbrance, to rid the claims of it to the best advantage, will ever mine this section successfully. Now for my example!

The most notable failure was that of the Dutch Flat blue gravel mining company, composed of San Francisco capitalists, which in A. D. 1871, commenced operations on a grand scale, and, under the direction of a California street mining broker as superintendent, erected the finest hydraulic works in the State, and commenced mining at two different points upon their ground located near the center of the Dutch Flat channel; bear in mind that the red gravel above the trap slide had been previously washed away by the miners, to the depth of about 200 feet, and near to this slide stratum, and a long sluice tunnel been run in the gravel near the bottom of the slide. The company commenced washing with 1,000 inches of water under a pressure of 500 feet, upon the top of this non-gold-producing trap slide, which at this point is fifty feet thick, and by dint of perseverance, an extravagant waste of labor, water and powder, and a most remarkable exhibit of ignorance, they bored a hole down through it, to the head of their tunnel, and washed a pit about 150 feet square; a cut was also opened on the southern rim of the claim on a level with the bottom of the same slide, with the expectation of large returns. The superintendent of the works was informed by your correspondent of the utter futility of his undertaking, but his scientific(?) knowledge of hydraulic mining was too profound to receive suggestions from country bumpkins who believed there was a difference between a stratum of water-worn gravel and a slide of hard earth and rock.

The enterprise was, of course, a failure, and after a useless expenditure of nearly or quite $100,000 the company struck its colors and surrendered.

I here venture the assertion that every attempt to open and work this Dutch Flat channel of mines on a higher level than the bottom of the channel will result in lose and grievous disappointment.

There are one or two companies which are now engaged in opening claims on this channel in an intelligent and sensible manner, and with fair prospects of a grand success. I will reserve them for my next.

Dutch Flat, August 6th, 1875.

South Mountain, Idaho.

EDITORS PRESS:—The S. M. C. M. Co.'s mines are looking well, yielding an abundance of ore. The deeper they are developed the more silver the ore is found to contain. The hoisting machinery of the Bay State mine is now in place and working finely, giving perfect satisfaction.

We are informed that the majority of the stock of the S. M. C. M. Co. is now under the control of Messrs. Hayward, Townsend and Minear, of San Francisco, and that hereafter the mines and furnaces will be under a new management. Hoisting works are to be erected on two or three additional mines. More extensive facilities for smelting will be provided soon, as the company have nearly 200,000 bushels of coal on hand, and are receiving an average of 3,000 bushels daily.

There are a number of good mines on this side of the company's that are well worthy of mention, among which are the Disappointment, Mono and Scandia. The former is down 90 feet, has well defined walls and a four-foot vein of rich carbonate ore, with 40 tons of good ore on the dump. The Mono and Scandia have prospect shafts down about 50 feet, with fine bodies of ore in sight, and from 15 to 25 tons of ore on the dump The above mines, and others equally as good, can be bought cheap for cash or bonded on reasonable terms. I believe those three mines would supply ore sufficient to keep a 50 ton furnace running steadily. I believe that if these mines that are undeveloped, owing to the want of capital, were under the management of a good substantial company "that meant business," they would pay dividends in a short time and prove a "bonanza" to the stockholders.

We had the pleasure last week of meeting Mr. C. T. Bell, the gentlemanly agent and correspondent of the MINING AND SCIENTIFIC PRESS, while on a brief visit to South Mountain. As his time was limited he only visited a part of the mines. We believe he left us with a favorable opinion of the future prospects of the camp. SMELTER.

South Mountain, Idaho, Aug. 5, 1875.

EXPERIMENT IN PHOSPHORESCENCE.—A writer in the *English Mechanic* says that if freshly prepared chloride of lime be thrown into a dilute acid, *in the dark*, distinct greenish-white phosphorescent fumes are seen to rise from the vessel, while the temperature of the mixture rises sensibly. The phosphorescent appearance lasts only two or three seconds. The nature of the acid does not seem to have much influence on the result.

San Francisco Manufactories.

Nothing shows the growth of a settled population more than the prosperity of its factories, machine shops, and home industries. In this city, the manufacturing and financial center of the State, factories of all kinds are continually on the increase. Scarcely a week passes in which we do not hear of the establishment of some new branch of industry, usually on a moderate scale, but destined to flourish and increase in prosperity within a few years. Our foundries and machine shops were never before in such a prosperous condition. They are overrun with orders, and are compelled to turn out articles of every conceivable class. They are, however, equal to the task. All the factories in the city are in good condition, and most of them making money. We give below a summary of statistics of factories, etc., in the city and county of San Francisco, taken from the annual report of the Assessor, dated July 29th, 1875. The summary is interesting and suggestive, showing as it does quite an extensive list for so young a city:

Amalgamating Pan Manufactory, 1.—Men employed, 12; pans made, 150; horse-power of steam engine, 6; value of manufactures, $30,000.

Artificial Stone Manufactories, 3.—Men employed, 51; value of manufactures, $137,000.

Axle-grease Manufactories, 3.—Men employed, 20; resin consumed yearly, barrels, 2,550; butter consumed yearly, pounds, 17,000; tallow consumed yearly, pounds, 10,400; aggregate value of manufactures, $91,600.

Barrel manufactories, 5.—Men employed, 215; barrels, half-barrels and kegs made annually, 247,250; horse-power of steam engines, 48; barrels made by sugar refineries, 75,000; syrup kegs made by tub and pail factories, 65,000.

Bed Spring Manufactories, 5.—Men employed, 22; copper wire used, tons, 520; aggregate value of manufactures, $141,000.

Bedstead Manufactories, 5.—Men employed, 725; lumber consumed annually, feet, 4,700,000; aggregate value of manufactures, $925,000.

Bellows Manufactories, 2.—Men employed, 11; bellows manufactured, 1,500; aggregate value of manufactures, $27,000.

Bedding Manufactories, 6.—Persons employed, 64; aggregate value of manufactures, $925,000.

Billiard Table Manufactories, 5.—Men employed, 95; billiard tables manufactured, 410; aggregate value of manufactures, $156,000.

Boot and Shoe Manufactories, 20.—Men and women employed, 2,000; aggregate value of manufactures, $2,793,000.

Borax Works, 2.—Men employed, 110; aggregate value of manufactures, $620,000.

Box Manufactories, 10.—Men employed, 372; horse-power of steam engines, 375; aggregate value of manufactures, $980,000.

Brass Foundries, 11.—Men employed, 273; aggregate value of manufactures, $1.055,000.

Breweries, 40.—Men employed, 365; beer made annually, barrels, 267,000; aggregate value of manufactures, $2,000,000.

Broom and Broom Handle Manufactories, 10.—Men employed, 174; brooms made annually, dozens, 100,000; aggregate value of manufactures, $200,000.

Brush Manufactories, 3.—Men employed, 37; aggregate value of manufactures, $50,000.

Candle Manufactories, 2.—Men employed, 110; candles manufactured, boxes, 150,000; aggregate value of manufactures, $425,000.

Clothing Manufactories, 8.—Men and women employed, 422; aggregate value of manufactures, $730,000.

Cigar Manufactories, 120.—Men employed, 4,000; cigars made annually, 95,000,000; average value of cigars per thousand, $40.

Chemical Works, 5.—Men employed, 50; nitrate of soda used, tons, 720; sulphur used, tons, 550; sulphuric and nitric acid used, tons, 900; sulphate of copper made, tons, 500; aggregate value of products, $425,000.

Carriage and Wagon Manufactories.—Men employed, 400; carriages, wagons, etc., made annually, 2,117; railroad cars made annually, 180; horse-power of steam engines, 190; aggregate value of manufactures, $837,000.

Coffee and Spice Mills, 10.—Men employed, 104; coffee ground and roasted annually, pounds, 2,930,000; chocolate made annually, pounds, 300,000; spices ground annually, pounds, 784,000; horse-power of steam engines, 70; aggregate value of manufactures, $1,102,000.

Cordage and Rope Manufactories, 3.—Men employed, 165; hemp and wire rope manufactured, tons, 5,500; horse-power of steam engines, 280; aggregate value of manufactures, $975,000.

Distilleries, 6.—Men employed, 100; proof gallons of liquor made, 1,594,962; value of manufactures, $1,647,000.

Dry Docks (Floating), 2.—Capacity of Docks, tons, 2,600; men employed, 15.

Dry Docks (Stone), 1.—Length of excavation in solid rock, feet, 450; width at top, feet, 120; depth, feet, 30; width at entrance, feet, 90; capacity of length, feet, 425; capacity in drawing, feet, 22; capacity of pumps for clearing, per hour, cubic feet, 325,368; tubular boilers of four-inch tubes, 4; dimensions of each boiler, diameter, inches, 25; length, feet, 16; fire surface of boilers, square feet, 3,800; men employed, 10; total cost of work, $675,000.

Flouring Mills, 8.—Men employed, 138; flour made annually, barrels, 446,000; hominy made annually, tons, 580; buckwheat and rye flour, tons, 685; oatmeal and groats, tons, 1,350; oatmeal and farina, tons, 2,530; feed barley, tons, 4,500; pearl barley, tons, 500; cracked wheat, tons, 200; split peas, tons, 100; run of stones, 50; horse-power of steam engines, 1,172.

Foundries and Iron Works, 16.—Men employed, 1,230; pig iron used annually, tons, 13,750; bar iron used annually, tons, 3,834; rivets used annually, tons, 94; horse-power of steam engines, 609.

Fur Manufactories, 5.—Men and women employed, 45; aggregate value of manufactures, $245,000.

Furniture Manufactories, 20.—Men employed, 507; lumber used annually, feet, 11,200,000; aggregate value of manufactures, $1,636,000.

Glass Works, 2.—Men employed, 167; furnaces, 3; pots, 12; aggregate value of manufactures, $270,000.

Glass Cutting Works, 2.—Men employed, 11; aggregate value of manufactures, $32,000.

Gas Meter Manufactories, 1.—Men employed, 4; aggregate value of manufactures, $15,000.

Glove Manufactories, 3.—Men and women employed, 100; aggregate value of manufactures, $130,000.

Glue Manufactory, 1.—Men employed 40; glue made, tons, 360; neatsfoot oil, gallons, 4,000; curled hair, pounds, 18,000; aggregate value of manufactures, $325,000.

Hat and Cap Manufactories, 15.—Men and women employed, 125; aggregate value of manufactures, 328,000.

Hose and Belting Manufactories, 3.—Men employed, 27; hose made annually, feet, 7,000; belting made annually, feet, 112,000; aggregate value of manufactures, $114,000.

Jewelry Manufactories, 30.—Men employed, 323; aggregate value of manufactures, $827,000.

Lead and Shot Works, 2.—Men employed, 90; lead made, tons, 10,000; shot made, tons, 500; aggregate value of manufactures, $1,000,000.

Last Manufactories, 2.—Men employed, 14; horse-power of steam engines, 10; lasts manufactured, 25,000; aggregate value of manufactures, $20,000.

Maccaroni and Vermicelli Manufactories, 3.—Men employed, 30; maccaroni and pastry made, boxes, 87,000; maccaroni wheat used, sacks, 9,500; horse-power of steam engines, 52; aggregate value of manufactures, $120,000.

Match Factories, 6.—Men employed, 87; matches made annually, gross, 250,000; aggregate value of manufactures, $260,000.

Malt Houses, 5.—Men employed, 35; grain malted annually, tons, $12,000; aggregate value of product, $300,000.

Oakum Manufactories, 1.—Men employed, 10; bales made annually, 5,000; aggregate value of manufactures, $25,000.

Pickle and Fruit Preserving Works, 4.—Men employed, 953; fruits and meats put up, dozens, 185,000; pickles put up, kegs, 45,000; aggregate value, $850,000.

Powder Works, 2.—Men employed, 58; horse-power of steam engines, 16; powder made annually, pounds, 980,000; aggregate value of manufactures, $568,000.

Rolling Mills, 1.—Men employed, 300; horse-power of steam engines, 400; cast iron used, tons, 1,000; scrap iron used, tons, 10,000; coal consumed, tons, 8,000; aggregate value of products, $750,000.

Saw Manufactories, 1.—Men employed, 30; horse-power of steam engine, 25; steel used annually, tons, 36; aggregate value of manufactures, $90,000.

Silk Manufactories, 2.—Men and women employed, 120; aggregate value of manufactures, $300,000.

Sash, Blind and Door Factories, 10.—Men employed, 502; horse-power of steam engines, 455; lumber consumed annually, 12,190,000 feet; aggregate value of manufactures, $2,500,000.

Silver Manufactories, 4.—Men employed, 88; aggregate value of manufactures, $252,000.

Shirt manufactories, 8.—Men and women employed, 743; aggregate value of manufactures, $798,000.

Slipper Manufactories, 18.—Men employed, 300; aggregate value of manufacturee, $200,000.

Soap Factories, 17.—Men employed, 152; soap made annually, 8,560,000 pounds; aggregate value of manufactures, $513,000.

Tanneries, 33.—Men employed, 244; horse-power of steam engines, 161; bark used annually, 7,900 cords; hides used, of all kinds, 216,000; aggregate value of manufactures, $985,000.

Telegraph Instrument Manufactories, 1.—Men employed, 40; aggregate value of manufactures, $75,000.

Tool Manufactories, 6.—Men employed, 43; aggregate value of manufactures, $210,500.

Trunk and Valise Manufactories, 6.—Men employed, 116; aggregate value of manufactures, $240,000.

Type Foundries, 2—Men and women employed, 53; aggregate value of manufactures, $55,000.

Vinegar Manufactories, 8.—Men employed, 68; vinegar made annually, 742,000 gallons; aggregate value of manufacturee, $122,000.

Windmill Manufactories, 4.—Men employed, 29; windmills made annually, 330; aggregate value of manufactures, $57,000.

Wood and Willow Ware Manufactories, 2.—Men employed, 70; horse-power of steam engine, 150; aggregate value of manufactures, $220,000.

Wood Preserving Works, 1.—Men employed, 30; horse-power of steam engine, 28; value of lumber used annually, $90,000; increase in value by preserving, $50,000.

Woolen Mills, 2.—Men and women employed, 900; number of power looms, 106; cart setts, 48; frames for knitting underwear, 20; frames for knitting hosiery, 50; spindles, 13,000; blankets made annually, pairs, 155,000; flannel drawers and underwear, dozens, 18,000; hosiery, dozens, 16,000; clothes and tweeds, yards, 850,000; flannel made, yards, 900,000; wool used, pounds, 3,150,000; aggregate value of manufactures, $2,200,000.

Watch Manufactories, 1.—Men employed, 140; number of watches made annually, 15,000; value of watches made, $14@$150.

Yeast Powder Works, 3.—Men employed, 16; yeast powders made, gross, 4,000; cream of tarta made, pounds, 140,000: soda made, pounds, 410,000; aggregate value of manufactures, $110,00

MECHANICAL PROGRESS.

High and Low Pressure Steam Engines.

It is a common but erroneous impression that by doubling or trebling the steam pressure by increased heat, we double, or treble, also, the power obtained. This, says the *Manufacturer and Builder*, would really be the case if the same weight of steam had not a diminished volume; but under actual circumstances our gain in power is by no means proportionate to the pressure under which we work the engine. Some engineers assert that there is great gain of power in using higher pressure, because when they run their engines at an increased pressure, and thus obtain more power, they forget that they obtain it at the expense of more steam and fuel; but this is not the sense in which we take the word "gain."

The question is, when employing the same amount of fuel, is it more economical to use higher than lower pressure?

In order to decide this question fairly in practice, it is necessary to compare the power of two engines, built, boiler and all, the one for low pressure and the other for high pressure, and both in the style found by experience to be the most economical in regard to the use of fuel. Such comparisons have taught that for stationary engines (when large boilers and furnaces, with consequent heavy parts are not objectionable) the condensing, low pressure engine has often, actually, given more power for the units of heat consumed, than the non-condensing, high pressure engine.

Our former arguments are based on the supposition that we had a steam engine working against the atmospheric pressure, a so-called high pressure engine, in which the first "atmosphere" of pressure obtained by the first 1,000 units of heat expended, gives no power, as it only counterbalances the natural atmosphere; the next atmosphere of pressure obtained by eleven additional units of heat, gives under the conditions supposed 30,375 foot-pounds; three atmospheres of pressure obtained by about twenty-three additional units, give 48,000 foot-pounds, and seven atmospheres pressure, obtained by about thirty-eight units of heat give nearly 60,000 foot-pounds. This is the reason that engines which do not condense the steam, nor produce a vacuum, but work always against the atmospheric pressure, can never be expected to work, except at a great disadvantage, at low pressure, and are therefore always worked at high pressure and temperature. In fact, at 212°, or a little above, such engines cannot work at all, while a condensing, or so-called low pressure engine can work at that temperature, the piston not having to overcome the counteracting pressure of the atmosphere, as is the case in all the non-condensing engines, which, for that reason, are called high pressure engines.

But the greatest advantage of working at high temperature and pressure is obtained by the use of the well known automatic mechanical addition called the cut-off valve, which is the next subject to be explained.

Theory of the Cut-off Valve in the Steam Engine.

To explain the theoretical advantage of the cut-off valve in the steam engine, which allows the steam to be worked expansively, let us suppose that a boiler supplies steam of 60 pounds pressure, which is obtained at an expenditure of 22 units of heat added to the 1,000 necessary to produce 15 pounds, an increase of only one-fiftieth in the heat supplied. The engine working with steam of one atmosphere pressure, will, under the conditions adopted before, lift 27x15 or 405 pounds, through a height equal to the length of the stroke of the piston. Approximately speaking, the same *weight* (not the same *volume*) of steam, but of four atmospheres tension, will do an equivalent work during the first quarter of the stroke; that is, it will raise four times 405 pounds through one-fourth of the previous hight. If now the connection between the cylinder and boiler be closed at this very moment, then the steam of course will continue to exert an expansive force, lessening gradually as the space between the piston and the bottom of the cylinder increases. At the moment the piston has reached the middle of the cylinder, the volume of steam has doubled, and its pressure declined to two atmospheres. When the piston has achieved three-quarters of the stroke, the volume of the steam is trebled, and the tension has fallen to one and one-third atmospheres; and at the end of the stroke, when the steam has four times its original volume, there is one atmosphere of pressure left.

In order to compare the efficiencies of a given quantity of steam, when employed at full stroke, and with a cut-off, let us suppose a cylinder and a piston of 4-foot stroke, and 27 square inches section. This worked with steam of four atmospheres pressure, and a full stroke will, at every single stroke exert a force of 4x 15x27, or 1,620 pounds, and this, multiplied into the length of the stroke, give 6,480 foot-pounds. In order now to cut the steam off at one-fourth of the stroke, and use notwithstanding the same quantity, we may either make the stroke four times as long or arrange the gearing in such a way that the engine may run twice as fast, or make the surface of the piston four times as great. The last plan would be the best; and we accomplish it by using a cylinder and a piston of double the former diameter, which would thus have 4x27, or 108 square inches surface. The steam acts on this surface with a pressure of 4x15x108, or 6,480 pounds, and cutting it off at one-fourth of the stroke gives a hight of only one foot, and consequently a power of 6,480 foot-pounds. The other three-fourths of the stroke are made after the ingress of the steam has been stopped, with an initial pressure of four atmospheres and a terminal pressure of one atmosphere. The mean pressure of this space of three feet would be two and one-half atmospheres, if the pressure decreased regularly during its expansion; but the cooling produced during the expansion of any gas or vapor, causes the pressure to dimish more rapidly in the beginning, and also in this case leaves the terminal pressure less than one atmosphere. We shall be nearer the truth in adopting as the mean pressure two atmospheres, which, multiplied by the surface of the piston, gives 2x15 x108, or 3,240 pounds, and this again multiplied by a 3-foot stroke, gives 9,720 foot-pounds. The efficiency of the steam in this case has thus been 6,480 foot-pounds for the first quarter of the stroke, and 9,720 for the other three-quarters, making together a force of 16,200 foot-pounds, against 6,480, obtained without cut-off in the smaller cylinder consuming the same amount of steam.

A NEW MECHANICAL MOVEMENT.—Mr. James R. Devor, of Goshen, Ind., has recently patented a device by which belts and pulleys, cog gearing, and other mechanism may be made to run on shafts which are out of parallel with each other. The arrangement is as follows: A ball is fastened tightly on each shaft, each ball having a socket composed of two disks, each of which has a broad slot through which the shaft passes, and which can turn to accommodate a shaft lying in any direction. The insides of the pulleys or cog wheels are made concave to fit the ball, having flanges which lap on the disks. The pulley or cog wheel is revolved by pins passing through it and the slots in the ball on opposite sides. The belt (when such means of transmission is used) is kept in place on the pulleys by guides supported by a rod which connects together the yokes on opposite sides of the ball. By this arrangement the ball is allowed lateral play, and the shaft to which it is attached can pass through the pulley at any angle. The usefulness of this novel invention will be apparent to mechanics, and a great saving of pulleys, belts, and gearing will be effected by its use in transmitting power from one shaft to another when not parallel to it.

CIRCULAR VS. BAND SAWS.—The German industrial papers are discussing the question of the disadvantages of circular saws as compared with band saws: 1st. Circular saws are very dangerous to the workmen. 2d. They require a much greater power to drive them than any other kind. 3d. They make a much wider cut, producing more waste, and thus fewer products from a given amount of material. The only advantage is, that the first cost of procuring a circular saw is less than that of a band saw; but, notwithstanding the Mechanics' association of Muehlhausen have already published in their yearly report the advice to abolish their use wherever it is practically possible to do so; and this is of course the case in the great majority of circumstances.

LEATHER BOARD.—A manufactory in Lowell, Mass., employs twenty-five hands in the production of leather board, so-called, which boot and shoe manufacturers use as a substitute for leather. The capacity of the factory is two and a half tons of board per day, and 15,000 pairs of counters. The demand has been so large this spring that the proprietor has been obliged to run twenty-four hours in the day. His goods are sold in Canada, the West, South, and, in fact, all over the country.

UTILIZATION OF COAL DUST.—Nearly twenty years ago, John Bourne, in his "Treatise on the Steam Engine," pointed out the advantage of blowing coal dust into a chamber lined with fire brick, so that it might be ignited by coming into contact with red hot surfaces, after having been mingled with quantity of air necessary for combustion. There are now several large manufactories in the United States using pulverized fuel for furnaces and boilers.

SHAPING SOFT RUBBER WITH A FILE.—Prof. Morton, of the Stevens institute, states that he finds the ordinary thick sheet rubber, used in making up lantern tanks, and for many similar purposes, may be readily dressed into an exact shape with a file, if only it is supported by being clamped between plates of wood or metal in a vice. The file is used dry, and in all respects as in working on wood or metal.

NEW BARREL MACHINERY.—H. A. Crossley, of Cleveland, is about completing his new patent machine for making barrel and hogshead staves. This machine is gotten up on an entirely new principle and is designed for cutting the stave so as to give each one the proper bilge for any sized barrel desired, and will turn out staves ready to be set up very rapidly.

FIRST SUSPENSION BRIDGE.—The *American Railway Times* says the first suspension bridge ever built was constructed by James Finley, of Fayette county, Pa. It was built over Jacobs creek, on the turnpike from Uniontown to Greensburg, in the State of Pennsylvania, in the year 1796.

SCIENTIFIC PROGRESS.

The Intensity of Different Colored Lights.

An experiment recently made at Trieste, to test the intensity of various colored lights, is worth recording in these columns, as it is naturally a matter of some interest to photographers. The experiment was a practical one, and designed for the purpose of discovering how far lights of different colors penetrate darkness, and whether they would be of any value for the lanterns of light-houses. Of course a white light is seen at a much greater distance than any colored illumination, and it is singular, too, as many of our readers have no doubt, remarked, when viewing a fountain illuminated by various colors, that when the white light is thrown upon the drops those appear at their best. At first we admire the violet; then a ruby light is thrown upon the falling water, and we pronounce in favor of that; then, perhaps, green, orange and blue illumination follow, all securing our admiration in turn, until, at last, the white light is again turned on, and its brilliancy and intensity give at once finer effects than the others. In the experiment at Trieste, half a dozen lanterns with carefully selected glass, and all furnished with oil and wicks of a like character, were set burning on the beach, and then observations were taken by a party of sailors in a boat. At half a league distant the dark blue lantern was invisible, and the deep blue one almost so, so that there could be no doubt as to their unserviceableness for lighthouses or beacons. Of all the colors, the green was visible for the longest distance, with the exception of the red, which ranked next to the white brilliancy. It is only the green and the red—such, indeed, as our railways make use of—that are capable of employment, and the green light the Trieste authorities only recommend in the vicinity of white and red lights, as from a short distance an isolated green light begins to look like a white one.—*Photographic News*.

IMPORTANT INVENTION IN TELEGRAPHY.—The *Galos* announces the arrival at St. Petersburg of M. La Cour, assistant director of the Copenhagen Physical Observatory, in order to submit to the telegraphic conference a new invention, which must produce a radical change in telegraphy. That invention gives the possibility of transmitting dispatches between two telegraph stations through one wire only, and by means of many instruments, so that transmission by one instrument cannot impede the action of the other. M. La Conr, whilst engaged some years ago in investigating the passage of electric currents through conducting media, found that electricity is transmitted from place to place by undulations analogous to those of sound. In consequence of this discovery, he hit upon an arrangement of electro-magnets and tuning-forks, by means of which a particular current passing through a tuning-fork pitched to a certain note does not become merged in or confounded with other currents which, after passing through differently pitched tuning-forks, are simultaneously transmitted along the same wire. This, of conrse, renders it possible to send many messages at a time through a single wire.—*Iron*.

EXPERIMENTS WITH ELECTRICITY.—Cadogan Morgan, in 1785, was the first experimenter who produced the electrical light in the interior of solid bodies. He inserted two wires in wood, and caused the spark to pass between them. The wood was illuminated with blood-red or with yellow light, according as the depth at which the spark was produced was greater or less. Many of the readers of the PRESS have doubtless seen an egg or a series of eggs lighted up by being placed in the line of discharge of a Leyden jar. An ivory ball, an orange, or an apple may be illuminated in a similar way. According to Tyndall, a lemon is especially suited to this experiment, "flashing forth at every spark as a spheroid of brilliant golden light." The wire used for the discharge should be brought within about half an inch of each other inside the lemon.

CHANGES ON THE MOON'S SURFACE.—Observations upon the spots on the floor of the crater Plato, on the moon's surface, now show that decided changes have taken place—judged by the record of previous investigations—the streaks and colors of the floor presenting unquestionable evidence in this respect. The changes in the direction and luminosity of the streaks detected are, it is said, of such a character that they cannot be referred to changes of illumination, but depend, rather, upon some agency connected with the condition of the moon itself. The color of the floor has been found to vary as the sun ascends in the lunar heavens, being darkest with the greatest solar altitude.

M. Deprez states that soft iron, malleable iron and temperod steel give the same results to investigations for determining the rapidity of their magnetization and demagnetization. The duration of demagnetization is 0·00025, and of magnetization 0·00160, seconds, approximately. Gray cast iron gives still better results, the time of magnetization being reduced to to 0·001 second. With this last metal, therefore, the highest possible rapidity in the transmission of signals may be attained. This is due, according to M. Deprez, to the molecular structure of the metal and not the proportion of carbon contained.

Salicylic Acid.

New and important facts in regard to the manufacture and use of this new tasteless and harmless disinfectant are continually being brought to light. The latest which we have noticed relates to a more ready means of increasing its solubility for disinfectant purposes. One of the principal hindrances in the way of its use has been found in the fact of its slight solubility in water. Phosphate of soda, it is known, increases somewhat its solubility, but it has been reserved for a chemist with the euphonious name of Rozsnyay to discover a better means than this. The salt employed by this chemist is one which itself possesses a certain antiseptic power, and this increases the power which the mixture of retarding putrefaction. This salt is sulphite of soda. If one part of salicylic acid and two parts of sulphite of soda are dissolved cold in fifty parts of water, the solution will be perfectly clear. The solution does not irritate an open wound in the slightest, and its disinfectant power is so great that, while a certain quantity of milk, to which has been added a solution of salicylic acid prepared with phosphate of soda, curdled in five days at ordinary temperature (66° Fah.), another portion of milk, to which was added a solution of salicylic acid prepared with sulphite of soda, remained fluid for two weeks.

Rozsnyay recommends one part salicylic acid and one or two parts of sulphite of soda dissolved in from fifty to one hundreds parts of water, for general use.

NEW PHENOMENA OF SOLAR RADIATION.—M. Desains has recently examined the variations which the calorific solar rays undergo at the same time in point of intensity and with reference to their transmissibility through water. He expresses the results reached in tables, which show the quantity of heat arising at noon during one minute, and at different periods of the year, on an area of 1.6 square inches. The numbers vary very slightly, ranging from 1 to 1,3. The minimum was observed in January, 1875, and the maximum in June, 1874. Another table shows how the quantity of solar heat varies in traversing 0.32 inch of water in a minute, at noon. On April 25th last, the sky being clear, sixty-three per cent. of the radiation was transmitted. In June and July, 1874, the proportion reached seventy-two per cent. M. Desain deduces from his results the curious fact that an increased transmissibility of the radiations is related to the presence of greater or smaller quantities of watery vapor in the high atmospheric regions. Facile transmissibility indicates cloudy weather on the following day; and on the other hand, when the reverse is the case, permanently fair weather may be expected.

TEMPERATURE AT GREAT HEIGHTS.—Professor Wahl, who accompanied Professor Wise in a recent balloon ascent, gives the following account of the temperature experienced: "The maximum temperature observed was 97° at starting, and this continued 1,300 feet. At 2,000 feet it was 96°; at 3,000 feet 85°. The fall went on until, at the greatest altidude attained—viz., 8,748 feet—the temperature was but 68°. It fell gradually as we descended, but was lower than in the ascent, owing, doubtless, to approaching twilight and the attendant lessening of the sun's power." Observations were also made with a view to estimate the quantity and quality of any mechanical or other impurities of the atmosphere, but it will require some little time and careful work before any information can be made public.

VANADIUM IN ROCKS.—Dr. A. A. Hayes, in a paper read before the American Academy of Science, Boston, in January last, states that he had detected vanadium in many rocks associated usually with compounds of phosphorus and of manganese. His mode of examination for the detection of vanadium is described in detail, but no complete analyses of any rocks are presented. The author proposes in a future paper to give a tabulated list of the rocks. He also states the occurrence of vanadium in the well water of Brooklinc, near Boston.

MORE PLANETS.—New York papers publish a communication from Dr. Peters, of the Litchfield observatory, stating that on the 4th of June he discovered two planets, one the tenth magnitude and one between the eleventh and twelfth; one in seventeen hours sixteen minutes of right ascension, and 23° 2′ of south declination, and both not far from one another. In honor of the reception given him in Utica, Dr. Peters styles these the "jubilee planets," and names them respectively "Vihilia" and "Adeona."

NEW PROCESS FOR COPPER ENGRAVING.—Bouquet de la Grye, of Paris, proposes to cover copper plate with a thin, strongly adherent coating of silver; the silver plate is then varnished with a colored resist, and the engraving traced with a dry point; the etching is then bitten in by perchloride of iron. In this way the aquafortie process is ameliorated, as the adherence of the silver renders the engraving as clean as the tracing itself; this is a defect for portraits, but essential for cards.

OXYGEN GAS when inclosed in a thin glass tube, will show itself under the action of a magnet to be paramagnetic, inclining north and south like iron; and while nitrogen, hydrogen and carbonic acids remain unaffected, phosphorous, leather and wood show themselves to be diamagnetic, and arrange themselves equatorially from east to west.

Sales at S. F. Stock Exchange.

The Mining Share Market.

The present aspect of the market cannot be said to be favorable to a maintenance of high prices. Saturday last the market closed feverish and excited, but ths week was opened with with a more healthy feeling though wanting in activity. Yesterday a degres of softness in leading stocks was apparent snd hy evening thers was a geueral downward tendency. To-day there is no improvement hnt rather the opposite. The market is decidedly weak and the timid ones are fearful of hrsaksrs ahead. The hsuks complain of the scarcity of money and are pnshing their customsrs for settlement. This, of course, has a dspreciating effect and will account for the weakness of the msrket. It is hiuted that this apparent "stringency" is bnt an item in the wsll arranged programme of the hear element.

Since our last the Empire gold mining company, of Sierra county, Cal., has declared a dividend of $5 psr share payable after August 17th, and tbe Empire mining company of Nevsda conuty, California, has dsclared a dividend of fifty cents per shsre which was payable on the 15th inst. The Lyon mill and mining company of Washos district has declared a dividend of fifty cents per share payable on the 18th inst.

A mssting of the stockholdsrs of the Hartford mining compsny has been called for Ssptemher 20th, to act upon a propoeition to increase the capital stock of the company.

At a meeting of the Savage mining company on the 17th inst. it was decided to increase the nnmber of shares to 112,000, and the capital stock to $11,200,000.

Reports from the Comstock continue of the most flattering character and there ie no doubt that the legitimate mining interests of the coast are in a more favorahle condition than ever before.

JUSTICE MINE.—On the 800-ft level excellent progrese ie heing made in the south drift, with very favorahle indications.

MINING AND SCIENTIFIC PRESS.—On the 3d inst. this paper, published by Dewey & Co., at 224 Sansome street, San Francisco, entered upon its thirty-first volume. It is, beyond a doubt, the best journal published on the Pacific coast for the scientist, mechanic and miner, and should receive the most liberal support. It costs much money, to say nothing of patience and endurance, to publish an ordinary paper; but the amount required of all these to publish such a paper as the PRESS can hardly be realized by amateurs or those not having had any experience in the publishing and printing business.—[Panamint News, July 14th.

MINING SUMMARY.

THE following is mostly condensed from journals published in the interior, in proximity to the mines mentioned

California.

AMADOR.

PLACER CLAIM.—*Foothills Ensign*, August 13: Some months ago R. Paterson and two others located a claim in the bed of Sutter creek, passing through the town, extending from the Mahoney dam to the west side line of the Maxwell quartz mine, containing about 16 acres of land. The claim was recorded last week. The owners are now engaged in working the central portion, which is paying good wages, some of the ground having never been worked. The claim will take at least two years to work out, and is expected to prove very rich as work is pushed toward the Eureka mill.

NEW WORKS FOR THE KEYSTONE.—Some 12 carpenters were put to work early this week to erect new hoisting works at the Keystone mine. The dimensions of the building will be 40x80 ft, and one month will be required to complete the work. Sutter creek is left minus a carpenter for the time being.

COLUSA.

QUICKSILVER.—Colusa *Sun*, August 14: From a gentleman just in from the mines, we learn that the Rathbun and the Lovelace claims are prospecting very finely. The Rathbuns have just uncovered a vein of fine cinnabar by a shaft 12 ft square. The vein is some 18 inches thick. They have enough of this to make 10 or 12 tons of quicksilver, in sight. They have made a contract with the Turner mine to run through their second grade ore, but they will put up a retort for their rich ore. The improvement on the Abbott furnace has been completed and works as well as was expected.

EL DORADO.

SAMPLE ORE.—*Mountain Democrat*, August 14: We have on our desk a sample of the quartz which is being taken from the bottom of the shaft in the Rosekranz mine, Greenwood district. This sample is beautifully seamed with galena sulphurets and exhibits a fine display of free gold. We are assured that this is but an average sample, and that there has been a steady improvement in the quality of ore as the shaft has descended. As ore of this quality will doubtless mill at least $30 per ton, there is little risk in predicting a bright future for the Rosekranz.

INYO.

TRANSFER OF MINING PROPERTY.—*Independent*, August 14: George D. Roberts and the Brown brothers recently disposed of their interests in the following named Coso mines to the Cerro Gordo Consolidated silver mining company: Grant, St. Louis, Capital and Mammoth, together with certain water privileges and other Darwin property. We have not heard the amount of the consideration but must have been a good round figure, as these all rate as first class mines. The same parties also sold the New York, St. Lawrence, Gen. Lee, San Francisco, Grant, London, Washington, Glasgow, Mt. Ophir, Vanderbilt, Rothschilds, Boston and Monster mines, all in the same district, to the Darwin Consolidated silver mining company. Chas. E. Elliot also made a sale of the Guervo mine, to the Goervo silver mining company. All of the foregoing mines have been incorporated with an aggregate capital of $10,000,000. The transfers have been duly recorded in the Clerk's office of this county. Darwinites are highly elated at the flattering outlook for their camp, and have good reason to be.

ITEMS.—A shipment of 75 bars of bullion was made from Darwin this week. The net weight was 7,000 pounds and the assay value of $280 per ton. This is the first for the district, and is from the Tyler or Union company furnace. This is a small furnace and when first started up got out 3 bars and then froze. It was soon cleared, however, and the next run was 80 bars. It is to be rebuilt, being too small for effective work.

WE are pleased to know that Pinte district, opposite Bishop creek, after so much talk, is at last to have a mill. Mr. R. M. Johnson has purchased the old Deep Spring mill, which is to be rebuilt and put in operation at Piute immediately.

THE galmadore at Pine mountain was completed the other day. The work was accomplished in less time and at less expense than was anticipated when the change was made. Everything works splendidly now, and there will be a shipment of bullion in a few days.

MR. WINGARD rode into town last night saying the boys had made a strike—not for higher wages, but of a higher grade of ore in the Silver Sprout. Messrs. Wingard and Page started early this morning for the scene of action.

KERN.

MINING MACHINERY.—*Californian*, August 12: We learn that the machinery, etc., for three furnaces for the antimony mines in San Emedio canon, has been shipped to this place from San Francisco. From here the machinery will be taken by teams. It is estimated that about twenty tons of the metal will be run out every twenty-four hours. It will be shipped by rail from Bakersfield to San Francisco, thence to parts of the world where it is used.

PLASTER OF PARIS.—In the San Emedio mountains, near the antimony mines, a mine of what is pronounced, on scientific test, a good article of plaster of Paris, and there has been developed an abundance of it.

THE SUMNER MINE.—Bakersfield *Courier*, August 14: From a private letter we learn that $46,000 in bullion has just been sent below—the proceeds of thirty days' run on the Sumner mine. The mill was run only daytimes. The same letter says that a new deposit has been struck in the mine that is much richer than the rock they have been working. The mine will now be kept running day and night, and we may expect that the next clean-up will make a startling exhibit. In Bright Star there have also been some rich developments recently made.

LOS ANGELES.

THE CHARLOTTE MINE.—Los Angeles *Express*, August 14: Our friend, Mr. E. G. Gaertner, arrived to day from the Charlotte mine. He has just completed the erection of a second arastra. Mr. G. exhibited to us the gold realized from the crushing of one ton of Charlotte rock. It is beautiful bullion, and amounts to a little over $50. It was crushed in the new arastra, and as the cracks had of course to be filled up, this yield is equivalent to at least $80 a ton. He can now crush with the two arastras combined, two and a quarter tons of rock a day. The shaft is down 25 ft in the Charlotte, and the vein is three ft wide. The Poyoreno also promises well. There is little doubt but that a gold mine of great value, and which will yield handsomely from the start, has at last been found in Los Angeles county.

THE WINSTON MINE.—The editor of the *Express* has lately visited the Winston mine, situated in San Gabriel canon, about 25 miles from Los Angeles. We extract from his published account: At a distance of perhaps five miles from the mouth of the canon, we reached the Winston mine. We found it located on the right bank of the river, and in a mountain perhaps 1,000 ft in hight. The houses are situated on a bench in the side of the mountain, some two or three hundred feet above the river, and within a few feet is an excellent spring of pure, sweet water. The hill has been prospected at three different points. A tunnel has been run 700 ft into the mountain at a point perhaps 100 ft above the river level. Another tunnel has been opened about half way up the hill, and still another at about 700 ft above the river bed. The lower tunnel cuts through ore at a distance of about 200 ft from its mouth, but runs in barren matter to the point of cessation. But, lately, a drift has been carried from a point beyond where the ledge was grazed, some 50 ft, at right angles from the course of the tunnel, opening into a body of ore which is manifestly the ledge itself. Standing in front of the lower tunnel and drawing a straight line with the eye from the top of the monotain, it will be seen that the tunnels are all in a direct range, and as the ledge has been opened in each, it is a fair presumption that the several works show conclusively the existence of a continuous vein all through the mountain. Ore has been taken out at every point, but in the upper tunnels the work has been done so as to show that the ledge is a very wide one. It is at least 35 ft in width in the upper tunnel, and the middle tunnel developments indicate a width of 50 ft. There is ore there in ample quantity, and the only question to be determined is as to its working value. The assays made have varied. There have been very high assays had and very moderate ones. The general average value of the vein rock can only be determined by working it, and, so far as we can learn, no large quantity of the ore has ever yet been crushed.

NAPA.

THE BELLA UNION.—Correspondence of the Napa *Reporter*, August 14: The Bella Union quicksilver mine is doing well under the supervision of James McQuid. They are at present working about 45 men, principally Chinamen, and have shipped altogether 64 flasks. The first shipment consisted of 40 flasks, product of 20 days' run with one furnace. The next was 24 flasks, which Mr. McQuaid informs me was only one week's run, making an average of four flasks per day. They have just started another furnace, so we may look out for larger shipments soon.

NEVADA.

CLEAN-UP OF THE NEW YORK HILL.—Grass Valley *Union*, August 13: The New York Hill mine has again been doing a big business. After a three weeks' run of the mill, 16 stamps operating, 360 loads of ore were reduced, and a clean up was made. The result is about $26,000, including the value of the sulphurets. That is about $72 to the load.

CLEAN-UP OF THE PITTSBURG.—*Union*, August 15: The Pittsburg mine, located near Deadman's Flat, and about four miles distant from Grass Valley, owned by Sanford and the McCook brothers, has had a crushing and a clean-up. Thirty-two loads were put through the mill, and yielded, in free gold alone, at the rate of $55 per car load, or a total of $1,760. From this crushing four tons of very rich and heavy sulphurets have been saved.

FIRE AT THE HARTERY MINE.—*Union*, August 17: Yesterday morning at about one o'clock, a fire alarm was sounded and the firemen turned out in force. The alarm was caused by the burning of the Hartery mill buildings, situated about two and a half miles south of Grass Valley. The buildings at the mine were entirely consumed, and the machinery much injured. The Hartery mill has been idle for some years, and no fire has been used in or about the mill for the same time. It is supposed that the fire was caused by an incendiary, who wants to destroy the machinery in the building. The loss cannot be estimated. The building burned was an old one and much decayed. The machinery cost about $9,000 and was very good. We set the loss down about $5,000, with no insurance.

SAN FRANCISCO COPPER MINE.—*Foothill Tidings*, August 14: The shaft is down 150 ft. At the depth of 45 ft the first level is made, from which ore is now being extracted. They have here drifted through the ledge, which is 76 ft thick and much of it of a very high grade. At the 150-ft level, a cross-cut of 40 ft has not reached the other wall of the ledge. The size of the ledge insures easy working; six men being able to break and send up 40 tons a day. On the surface the ore is piled no around brick flues in a conical shape, set on fire and allowed to burn until the fire extinguishes itself, showing that the sulphur is burned out. This takes from two to four months, and 80 tons are reduced in each cone.

RICH IRON ORE.—Mr. Caleb Harrington, of this place, showed us yesterday a sack of iron ore, just brought up from a newly discovered mine, only about six miles from Grass Valley. The ore, to all appearance, is very rich in iron, almost as pure as cast iron, and from all we can learn the deposit is very extensive.

PLACER.

CLEAN-UP.—Placer *Herald*, August 14: The Auburn gravel and ditch company, after a run of about 20 full days, made their first clean-up at the beginning of this week. According to the estimate of the engineer, they had washed 17,500 yards of gravel, and from this they cleaned up 30 pounds of retorted gold. This, at $200 a pound, would amount to $6,000, which, as will readily be seen, is a low estimate. The result is highly satisfactory to the stockholders. It assures them that the enterprise is a paying one, and acting on this assurance they have already let the contracts for extending the pipes and fitting up Tunnel hill, on which they expect to be ready to commence washing in about a month.

DEVELOPING THE KIRKLAND.—The Kirkland quartz mining company, whose claim lies near the town of Ophir, have begun the work of developing their mine in earnest. F. R. J. Dixon, an experienced miner of that district, has been appointed superintendent, and we learn from him that it is the intention of the company to sink 600 ft at once. If they do we predict flattering results, for it is the universal opinion of miners here that depth only is needed to insure the permanency of the mines in this district.

PLUMAS.

MINING ITEMS.—Plumas *National*, August 14: Two more companies were to commence work on Monday last, on locations adjoining the blue gravel claims of Pierson, Winters & Co., near Nelson. The prospects of that part of the country are improving every day, and it promises soon to be a lively camp. The East Branch company has quit piping for a short time. It will take about three weeks to get the water through to the White or Wing claims, which are known to be rich.

TUOLUMNE.

THE UNION MINE.—Tuolumne *Independent*, August 14: The 5-stamp steam power mill at Rock gulch, near Columbia, is almost ready for crushing. The lode formerly six inches, has widened out to two feet. The rock shows gold from the top down, a distance of 70 ft, with the naked eye.

REED & Co's. "HI-A-PO."—A number of "quartz sharps" recently visited this famous pocket lead a few miles above Columbia, and report that while there, the boys chipped off over $100 and left plenty more in sight; that when they strike gold it is nearly all gold and but little rock. Eighteen pounds of ore were taken from one of these pockets a short time ago.

THE Goss & Farley mine, at Summit pass, near Columbia, have their 5-stamp water mill ready to start up. The vein runs across the Royal lead, running east into the Pasco sink, where big money was taken out in early days. The quartz is decomposed and resembles salt. They are down 70 ft on a 2-ft vein which prospects well.

QUARTZ STRIKE.—In the early part of last week a nice strike was made by an Italian or Austrian named Antone Ivancovich of $1,500, and two or three days previously he struck the pocket when he got out $500 more, making in the week $2,000. Last year the same person was lucky enough to take out in a pocket $8,000.

VENTURA.

THE NEW MINING DISTRICT. — *Californian*, August 12: That section of country known as Frazier mountains, in Ventura county, is now attracting considerable attention as a mining district. J. B. Tungate has just returned, bringing with him some fine samples of quartz to be found there. In that part of the country is where Dave Menzies and Joe Acklin made their pile last winter while placer mining.

Nevada.

WASHOE DISTRICT.

CONSOLIDATED VIRGINIA.—*Territorial Enterprise*, August 14: The work in the C. and C shaft goes steadily on. The new engine therefor arrived Thursday. It is an immense affair. The cylinder is 40 inches in diameter and has a stroke of 8 ft. As everything is in readiness, the work of putting it in place will be speedily accomplished. The connection will be made directly from the crosshead of the engine to the bishophead of the bob, thereby doing away with all intermediate gears, shaftings, etc., and effecting a great saving in friction, besides running no risk of breaking gears. It is the largest engine ever brought to the Comstock. The bed-plate weighs 29,700 pounds, and the cylinder itself weighs 30,050 pounds. These are the heaviest pieces of machinery ever brought to this city. The valve motion is controlled by what is called cataract gear, so arranged as to work the engine either single or double-acting, and will so regulate it as to make 1 stroke in 10 minutes or 10 strokes in 1 minute, or any intermediate number required, and according as the quantity of water in the shaft may render necessary. The pump shaft is 5 ft 4 inches by 6 ft. The pumps to be attached to this monster engine are 12 inch plungers, 7 ft stroke, placed each 200 ft vertically above each other, and are to be arranged in the shaft so as to give as much room as possible that the balance of the space may be utilized for the purpose of conducting compressed air, etc., to the depths below.

CALIFORNIA.—The developments in the depth of the California continue to be of the most interesting character. The drift north on the 1550-ft level is still advancing and is encountering the richest kind of ore. The assays that have been made of the ore as taken from the drift, and without any selection being made, have run from $550 to $750 per ton. On this level two cross-cuts have been started, with a view of still further opening up this wonderful deposit and connecting it with the shaft. The faces of both are in the same quality of ore as the drift above mentioned. On the 1500-ft level the lateral drift in the ore vein, running northward from cross-cut No. 5, is steadily advancing, the face still in rich ore. The drifts in the ore vein are also being run from cross-cut No. 5. One of these drifts is going southward to connect with the lateral drift from cross-cut No. 6, and the other north to connect with the Opir. The face of both drifts are in good ore. On the 1400-ft level the face of the north drift is steadily advancing toward the Ophir line. The developments are better and better as the drift proceeds, the ore being of good quality. The work on the new mill still progresses favorably. The frame of the battery mill is going up, and is being constructed in the most thorough manner, nothing being left undone which can contribute to its strength or durability.

CHOLLAR-POTOSI.—The work of drifting south on the 1500-ft level still goes on and good progress is made. It is the intention to continue this drift and the one in the same direction from the 1250-ft level through to the south line. The latter drift is also advancing rapidly. The drift on the 1350-ft level is being driven on, an average of 2 ft per day being made. There are no new developments to be recorded. The daily yield of ore from the upper levels exceeds an average of 90 tons per day. The Combination shaft is encountering hard rock, but is making good progress, averaging over 3 ft per day, which, considering the size of the excavation, is good work. It is being thoroughly timbered as fast as sunk and with the best mountain spruce.

SAVAGE.—Work has been resumed on the 2000-ft level. The drift north toward the Gould and Curry is being cleaned out, and will be pushed on to the connection, for the purposes of ventilation. The work on and below the 2200-ft level is making good headway. The drifts north and south still hug the wall of the vein. The winze 100 ft north of the south line of the claim is going down at the usual lively rate, without material change in the formation encountered. The rock in the incline below the 2200-ft level is very hard and the water encountered hot, but the work is making good progress.

OPHIR.—The works are being so thoroughly reconstructed as to be hardly recognizable. The retimbering of the shaft has been completed. The guides are all in, hoisting water has commenced and work will be resumed Monday. The machinery is running to-day. Everything in and about the place has a very busy though quiet and orderly look, and the amount of work going on at all points is astonishing. When the incline machinery and new machinery are ready to start up the developments of the mine will go rapidly and systematically on.

BEST & BELCHER.—Still timbering and enlarging the main drift connecting with the Gould & Curry on the 1700-ft level. Cross-cutting will soon be commenced, and the ore vein, along which the drift runs without penetrating, will then be laid open.

BELCHER.—The upper levels continue their yield of 450 tons per day, and appear unchanged. The air shaft is being led down below the 1200-ft level, and is needed to ventilate the mine. The prospecting drifts on the 1600-ft level are making good progress, and in favorable working ground. The ore stopes on the 1500-ft level are being prepared for use.

GOULD & CURRY.—Still timbering and enlarging the drift connecting the 1700-ft level with the Best & Belcher. The progress is slow, on account of the heat. Cross-cutting will soon commence, and then look out for developments. The drift has only followed the wall of the ledge, without penetrating the ore vein.

JULIA.—Still sinking and drifting on the 1000 ft level, and making good progress in both. The shaft has passed the 1450-ft level, and is in rock favorable for rapid progress. The drift south has run 1116 ft, and has encountered soft clay and an increase of water. The working force has been increased during the week by the addition of two more Burleigh drills, and a lathe has been set up at the works for convenience in repairs, etc.

NORTH CONS. VIRGINIA.—The new hoisting works have been placed in position and are found to work admirably. They are of sufficient power to sink 1200 ft. Sinking is making good progress.

Popular Lectures.

Economy of the Vegetable and Animal Kingdoms.

Seventeenth Lecture delivered before the University of California College of Agriculture, on Monday, February 15th, 1875, by Prof. C. E. Bessey. (Concluded.)

[From Pacific Rural Press']

Production of New Breeds by Crossing.

From what has been said, it will readily be seen that there are many difficulties in the way of producing hybrid or cross breeds which shall be of permanent value. From the very nature of the case it is usually the desire to cross two forms which are very widely separated.

We first meet the difficulty of sterility, either as an absolute sterility of the individuals concerned, or a sterility of the offspring; next we encounter prepotency, and then reversion may after all spoil all our work. The first difficulty must be gotten over by what may be termed a gradual approach; that is, if it is desired to cross two forms which are found upon trial to be sterile, it may be accomplished by ameliorating one or both of the forms. For example, it is quite desirable that in the United States we produce a cross or hybrid between the cultivated apple and the wild crab apple. This has not as yet been as successful as we wish it to be, doubtless, because of the considerable difference between the two forms. The proper course then to pursue is to bring this wild form into cultivation for a series of years, until it has become somewhat modified, when no doubt the desired crosses can be successfully made. In some cases it may be done in this way:

First cross with some intermediate form and then cross these intermediate hybrids by a careful use of propotent individuals; the results of these last crossings may be made much more valuable and the danger of reversions be removed to a considerable extent.

Crosses by Grafting.

I cannot take leave of this subject of crossing without calling your attention to another form but little understood as yet, that is, crossing by grafting or budding, that is, by the union of two individual plants. It has long been known that changes could be wrought upon a variety by grafting it upon another, although nothing definite has as yet been worked out regarding it. We have a good many scattered observations but as yet none which have been followed to some definite result. I have known of some hybrids being formed in this way which were almost as well marked as if they had been made by sexual crossing.

In one case which came under my notice a Blackheart cherry was grafted upon a very sour Morello stock and the result was that the cherry was changed in taste so greatly as to make it almost inedible, its size was reduced and its appearance otherwise changed. Want of time prevents a further discussion of this subject, which as you can readily see is of very considerable importance to all cultivators of plants. Nearly allied to the preceding kind of cross is that which is produced upon the stock when grafted with a cion from a different variety. Of this we know even less than of the preceding. But we do know that in many cases the stock is considerably changed after the graft has been set in. No doubt if we made a proper use of this fact we could secure many of those nicer shades of difference in plants which it is so difficult to get otherwise. Closely allied to this is the influence of fœtus upon the mother in animals. It is well known that if a female gives birth to a hybrid, she herself has become possessed of some of the characters of the hybrid. Hence it is the practice of our best breeders *never to allow the females of their flocks and herds to cross with the males of inferior stock*, as all of the subsequent offspring of such crossed females will be to a slight extent hybridized.

Bud Variations.

In growing plants, especially such as are under high cultivation, we cannot but observe that more or less frequently parts of a plant will vary from the form and appearance of the remainder. Frequently this shows itself in the absence or presence of color in the leaves of a particular shoot or branch, or it may be in the different color of the flowers on a branch; less frequently it shows itself in a changed form for leaf or flower, and less frequently still in differences in fruit. To these changed forms, to these "sports," as the gardener terms them, we apply the term *bud variations*.

As I told you in my last lecture, reversions may take place in this way; that is, a plant may revert in one of its branches, by a variation of its buds, backward to its original form. This matter of *bud variations* is, however, of more interest to us when these changes are, so as we can see, not of the nature of reversions, merely, but when they seem to produce *new* forms. If any of you will take the trouble to look up the history of any of the geraniums with gayly colored leaves, you will find that such varieties originated from "sports" which appeared upon plain leaved plants. The two forms now so deservedly popular, named by florists, "Mrs. Pollock" and "Cloth of Gold," originated in this way; the former, as I know, from a very plain variety, the "Emperor," which has been remarkably prolific in bud variations. A few years ago, while in charge of a greenhouse in the East, this old variety, "Emperor," showed its tendency to vary, in a remarkable way. From near the root a bud pushed out which developed into a shoot bearing leaves white throughout, with the exception of a very faint pink zone in the central parts. Now, this certainly was not a reversion but a pure sport or a bud variation.

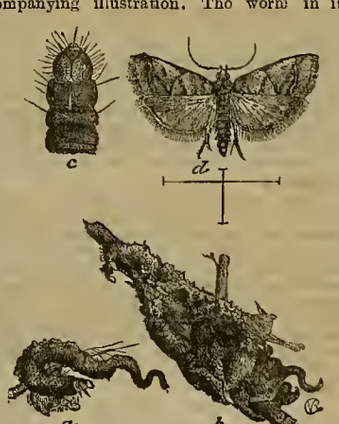
By propagating such sports by slips, buds or grafts, such varieties may be retained for a considerable time. In this way many of our varieties of flowers, and some of our fruits have been obtained. In some cases they are quite stable, sufficiently so to be propagated by seeds, as is the case with the varieties of Indian corn and wheat, some of which are no doubt bud varieties.

Allied to the bud varieties in plants, are the sports, so called, in animals, although they differ considerably in some important particulars. I refer not to the monstrocities which now and then occur, and to which the term "sports," has occasionally been applied, but to the perfectly formed originals which differ remarkably from the other individuals of any particular variety.

In many cases new breeds have thus arisen, which have been of great service to man. In fact it may be said, that most of the animals which have exerted a strong influence upon our different breeds were sports. The famous Morgan breed of horses, according to some authorities, had its origin in this way.

The Leaf Crumpler.

We give to-day another portrait from our horticultural "rogues' gallery;" introducing to our readers the leaf crumpler, as seen in the accompanying illustration. The worm in its



Apple-leaf Crumpler.

case is seen at *a*; the curled leaves with a bunch of these cases is seen at *b*; the head of the worm, magnified, is seen at c, while *d* represents the perfect moth.

The apple is the favorite of this insect; indeed, it is principally known as the "apple leaf crumpler;" but besides this it infests the cherry, plum, quince, crab apple and pear. The wild trees of the above named fruits are also infested with the leaf curler, or crumpler, and this adds to the difficulty of exterminating it.

Their presence is most readily seen when the trees have shed their healthy leaves. Those in which the crumpler worms are encased will then adhere to the tree, being fastened thereto by the silk of which their cases are formed. Here they remain, completing their growth; and at the return of warm weather and the opening of the new buds they are ready to devour the fresh and tender leaves. Having now arrived at the stage when most is required to support them, and the tree being at this time in a condition when the season's foliage is most easily damaged, it is at this period that the leaf crumpler is most destructive. Where they are very abundant they will sometimes consume the leaves as fast as they appear; thus cutting off the season's supply of foliage.

In countries where the winters are long and severe, it is in June that the full-grown worm changes to the pupa state, inside the tubes, and in July hatches out as the moth or "miller." This is a small, grayish brown insect, well represented in our illustration. It commences at once to lay its eggs upon the twigs of the tree; and from these eggs minute worms are soon hatched which at once take to the tender leaves and commence feeding upon them, and to construct for themselves little tubes of silk to serve for their protection. They eat and grow, making additions to their tubes and extending their ravages.

Hard to Fight.

There are several circumstances surrounding the leaf crumpler which render its extermination difficult, and give a discouraging aspect to a course of warfare against it. In the first place it never goes into the ground; consequently it escapes the perils to which insects in the grub state are subjected. In the second place there are, as yet, no birds known that will devour them; and were they so disposed they are so thoroughly protected in their cases that they have little to fear from such attacks. Again, the firm adhesion of the cases to the twigs of the tree makes their removal, even by hand, quite difficult. It has some insect enemies, but these, like the birds, can effect but little in the way of extermination, on account of the worms' invulnerable case. It has been suggested that poisonous solutions be tried, as in fighting the canker worm.

The leaf eating insects are really more dangerous enemies than those that prey upon the fruit; the latter only consuming the product of the tree, while the former virtually consume the tree itself. But in thus placing the highest possible estimate upon the capacity of the leaf crumpler, both for mischief and endurance, we are not striving to produce a feeling among the fruit growers of California that will induce them to cut down their trees or give up to this insect when it is discovered upon the twigs in their orchards. What we have said is with a view to impress our readers with the importance of watching their trees closely, even in summer, and pick off all leaves that are beginning to curl; and in winter remove the fastened cases, even though it be a slow and difficult job.

In entomology this insect is known as the *Phycita nebulo*; sub-order—Lepidoptera; family —Pyraidæ.

Hair vs. Leather Belts.

For some time hair belts have been introduced and manufactured in Germany, great advantages being claimed for them, namely: greater strength and more adhesion, so that thinner and narrower belts could be used for the transmission of the same power for which thicker and wider leather belts were required. In order to settle the dispute in regard to this important matter, which had sprung up among manufacturers, L. Stark & Co., of Mayence, made a series of experiments, the results of which were:

1st. In regard *to strength*. When three leather belts one-quarter inch thick and two inches wide broke respectively at a charge of 2,300, 2,010 and 1,900 pounds, three hair bolts of the same thickness and half an inch wider, broke respectively at 1,668, 1,734 and 1,580 pounds. The hair belts were thus found to have a disadvantage of some twenty-four per cent. on the average instead of an advantage, as was claimed by the hair belt manufacturers.

2d. Experiments in regard *to friction* gave an advantage of eighteen per cent. in favor of the leather belts. When the same sizes of belts made of hair and of leather were tried alternately, and resistance to the motion was applied, the hair belt slipped, while the resistance could be increased eighteen per cent. before the leather belt slipped.

3d. *Price*. Hair belts cost about thirty per cent. more than leather belts, while their price increases for width and thickness in a greater ratio than for leather belts.

4th. *Shifting*. When a belt has often to be shifted from one pulley to another, the edges suffer much, and when this is the case with a hair belt the edges become loose and the belt dissolves in single strands, so that hair belts cannot be used where shifting is often required.

5th. *Repairs*. The repairing of hair belts is infinitely more troublesome than it is with leather belts.

6th. *Splicing*. Leather belts are easily connected by several methods, as lacing, riveting, gluing and hooks and eyes, while hair belts are very difficult to splice, and are in this respect even worse than rubber belts.

7th. *Age*. When hair belts become old, they lose their friction-promoting covering with which they are provided, and become smooth sooner than leather belts.

All these are undoubted disadvantages, and the use of hair belts will never be adopted, except in special cases where the exposure to vapors and acids would exclude the use of leather.—*Manufacturer and Builder*.

Compression in Castings.—Col. Uchatius, director of the arsenal at Vienna, whose name is coupled with a peculiarly fine and tenacious steel made in Sweden, has lately given the results of an exhaustive series of experiments on compressing bronze when in a state of fusion, and otherwise treating so that it acquired many of the properties of steel. With an alloy of ninety per cent. of copper and ten per cent. of tin, and a pressure of eighty tons, a very hard, tenacious metal was produced, but one with little more elasticity than ordinary bronze. On cold rolling this bronze cast, under pressure, into an ingot, its power of resistance, its elasticity and hardness were increased. After repeated experiments it was found that an alloy of ninety-two per cent. of copper and eight per cent. of tin was the best and most economical. In casting the bronze to produce a homogeneous mass, after repeated and varied trials a double mould with a solid forged copper core 0.05 metre in diameter was decided to be the best. The bronze produced in this manner is declared to have all the hardness, homogeneousness, and power of resistance of steel tubes. Its wearing qualities are as great, and the cost of bronze guns made in this way is much less than steel if the value of the old metal is taken into account.

Work upon the Tasajara coal mine is progressing finely. The shaft is being put down very substantially, and the quality of coal is improving splendidly. The owners of this mine feel sanguine of having a permanent strata of coal and of an excellent kind.

The Universal Use of Arsenic.

Prof. Henry Wiertz writes as follows in the *American Gas Light Journal:*

We object not only to allowing Paris green to be spread over our fields, to contaminate the soil of our market gardens, but even to its being allowed, as it is, to be kept on open sale in our shops, so that an amount of poison which would sicken a city—by introduction into a distributing reservoir, for example—could at any time be purchased, without suspicion, by any maniacal or fiendish individual, and so introduced, with far less trouble or liability of detection than many of the murderous performances of such individuals.

In America we are happily endowed by nature with a general absence of this deadly mineral arsenic from our rocks, our soils and our mineral waters, and we ought to keep ourselves so. Whether this is one cause or not of the known longer average of human life in America than in Europe, it will be safer and better for us to admit that it is one such cause, and not to throw away or destroy our advantage in this respect by sprinkling arsenic over our vegetation all through the land. It is true the predatory insects must be destroyed, but let it be with such poisons—and they are known to be many—which have been given us by God for these special uses—which are endowed with deadly doom for all the insect tribe, while, almost without hurt for man. Among such none are more prominent or more familiar than the gas tar products, of which we spoke in this same connection in our last issue. Let these be used instead of arsenic.

Arsenic is, in fact, getting to be, throughout the world, almost as common as dirt. We doubt very much whether it would not be impossible, at the present day, in any country, to convict on chemical evidence before any jury, the most bungling arsenical poisoner, if he or she had a legal defender who would make such use as he might of the argument furnished him by the almost universal distribution of the venomous element throughout our most familiar walks of life. We have received medicines, ourselves from drug stores, wrapped in arsenical papers put up in Paris-green paper boxes, with arsenical paper caps tied over the corks, etc. We have often seen confectionery exposed for sale to young children wrapped in the deadly green paper. We have often found young children sucking toys painted with the horrible stuff, and with their mouths stained throughout with the venom, The Paris-green paper is one of the commonest in use for binding school books, and we have more than once taken such books away from our own young children, which had been given them by their teachers. Numerous deaths of children are well known to have been thus occasioned. No country can be called civilized in which such suicidal ignorance, such stupid slaughter of the innocent, is common. One more illustration only. It is very common to see a lawyer or his clerk, put into his mouth, to moisten the gummed side of it, a beautiful green paper disk, with scolloped edges, to attach to some document. These things are found in every lawyer's office in the land, and used constantly. They are seldom made of any other than the Paris-green paper. Can this be ignorance, or are our lawyers all fatalists, and believe they can only "die when the time comes?" In commencing to write we had in our mind to refer to some of the wonderful facts developed of late, in Great Britain especially, of open carts loaded with white arsenic passing in open day through the country in some districts, with drivers sitting on the top of the hideous heap; such carts being often exposed all night openly to the rain; of strongly arsenical waters flowing from mines and metallurgical works, into streams of water afterward drank by large populations, and so on. Those are facts. Everybody will remember the cargo of salt and arsenic together shipped to us from Europe a few months ago, which got a little mixed during a rough passage. This particular mixture was discovered in time, but have all such been discovered? The water we ourselves drink comes from a stream, on one of whose tributaries is a large chemical works, which so contaminates the said tributary with arsenic that cattle drinking of it have been poisoned to death. These things, we say are facts, on both sides of the Atlantic; but really while we wrote the first part of this article—especially when we thought of the recklessness of the public press, which has actually recommended their rural readers, in many cases, to pile on the Paris-green on their potato patches with a perfect looseness—these other things seem trifles as flat and stale as they certainly are unprofitable; and our enthusiasm and zeal for the cause of humanity seems to wilt down into a sort of sentimentality, which is certainly ludicrously lame and impotent, if not downright sickly.

Grasshoppers not an Unmitigated Evil.—It is stated as a curious fact in connection with the grasshopper ravages in Western Missouri that wherever pastures have been destroyed by these insects, new varieties of grass, never before seen in those localities, have sprung up. The principal species is a bunch grass of luxuriant growth, covering ground formerly producing nothing but blue grass. It is said that cattle eat this new species of grass with avidity. It is generally thought that the seed of this new grass has in some way been brought to the region designated by the hoppers. But it is not known where the grass originally grew, or what may be expected of it if its growth continues. It is thought by some that after all, grasshoppers may not prove an unmitigated evil.

Useful Information.

California Oysters.

The first business trains which crossed the Pacific railroad contained cars freighted with oysters. As it was known that California did not possess any edible quality of this bivalve, Mr. A. Booth, of Chicago, undertook the transportation and planting of many thousand baskets of oysters on the Pacific coast. Similar changes which oysters undergo when transplanted along the Atlantic coast have already been proved to take place on the Pacific coast with the oystors coming from the Eastern regions.

In going south, the round shape of the shell is elongated until off the coasts of Georgia and Florida they assume a razor-shaped shell. In California our transplanted oysters loses its oval or round shape and lengthens out. The Northern oysters planted in San Francisco bay are put out in four or five feet of water, and mature and fatten rapidly in from six to twelve months. In New York bay this takes from two to four years. Every year some 500 car loads of small oysters are transported across the continent, to be brought up in the Pacific.

There are some peculiarities as to the character or origin of the oyster to be transplanted. They always come from Egg harbor, Raritan bay, Newark bay and Long Island sound. The more Southern seed invariably dies. There appears to be a limit to the growth of any kind of Eastern oysters in the Pacific waters; after a certain period, a year and a half at the utmost, for some reason as yet not well understood—perhaps the meat becoming too large for the shell planted—the oysters die. A great deal of precaution is necessary in guarding these planted oysters. A fence of pickets six inches apart is placed around the California oyster park. The enemies of the oysters are the stingaries and star fish; at low tide the oyster shepherd goes in and kills such marine wolves as may be devouring his flock. There is a small clam, a native of the California coast, which is quite edible; further north, on Puget's sound, there are clams twelve inches long, eagerly devoured by the Indians, while the native oyster from Oregon is very small in size, and has the coppery flavor of the worst European bivalves.—*Manufacturer and Builder.*

Singular Explosion—At the works of Hewes & Phillips, N. J., a few days since, it became necessary to remove the rings from a steamboat piston, which was hollow, with two sets of packing rings. The rings were found to be rusted and corroded fast, and the piston was placed on a fire in the blacksmith shop to loosen them by heat. In a few minutes an explosion occurred, and the piston was blown to pieces, injuring one man so that he died in a few minutes, and hurting another badly about the face. On a close examination of the pieces, it was believed that marks of an old crack were found. It is thought that, when hot and under pressure, some steam may have leaked through into the piston and subsequently condensed, and the crack may then have been rusted tight. When the piston was heated, this water inside became converted into steam and caused the explosion.

To Protect Maps, Pictures, Etc.—Coat a plate of glass thinly and uniformly with a warm mixture of one-quarter of an ounce of ox-gall and one quart of a solution of glue, which will form a stiff jelly on cooling. When the film is set, render it insoluble by immersion for two or three hours in a solution of acetate of alumina, which may be formed by dissolving one ounce each of alum and acetate of lead in a pint of water, and decanting the clear liquid from the sulphate of lead formed. Then wash and rinse well, give it an additional thin coating of a weaker glue solution, and lay the picture, slightly but uniformly moistened, upon it, face downward; smooth out by gentle rubbing, place in a warm room for three or four days, and remove from the glass when thoroughly dry, by cutting the film around it. The back of the picture may be coated in a similar manner, and it will then lie without a frame.

A Simple Way to Make Badly-Fitting Blinds and Doors Shut Tightly.—When blinds and doors do not close snugly, but leave cracks through which drafts enter, the simplest remedy, recommended by Mr. Schuetze, building commissioner in Dresden, Germany, is this: place a strip of putty all along the jambs, cover the edge of the blind or door with chalk, and shut it. The putty will then fill all spaces which would remain open and be pressed where it is not needed, while the excess is removed with a knife. The chalk rubbed on the edges prevents the adhesion of the putty to the blind or door, which then can be opened without adhesion, and the putty is left in place, where it soon dries and leaves a perfectly fitting jamb.

Lead Pencils.—Wondering what becomes of all the lead pencils is in order. In one week of last month a New York firm received orders for 445 miles of lead pencils. To make these only 83,000 feet of cedar lumber are required, and after they are made they will load six freight cars. This immense consumption of lead pencils is doubtless caused by the attempt of women to sharpen them with a pair of scissors or a dull case knife. Persons who have witnessed these efforts need no longer wonder at the demand.

To Stain and Varnish Walking Sticks.—Make a solution of three parts glue, in 100 of warm water. To this add one part whiting, two parts of orange chrome; mix well. Apply hot with a soft brush to your sticks. When thoroughly dry, rub down with a piece of dry flannel. Apply a second coat of color, if deeper tints be required, or use burnt umber and brown ochre for oak tints. When dry, apply the following varnish: Coarsely powdered copal and glass, each 1 oz.; alcohol, 6 to 8, 1 pint; camphor ½ oz. To be heated over a water bath, with constant stirring, until all the copal is dissolved. When cold, decant the clear portion. Be careful that the alcohol does not inflame.

Green Bronze.—The repeated application to copper or brass of alternate washes of dilute acetic acid and exposure to the fumes of ammonia will give a very antique looking green bronze; but a quick mode of producing a similar appearance is often desirable. To this end the articles may be immersed in a solution of one part perchlorate of iron in two parts water. The tone assumed darkens with the length of immersion. Or the articles may be boiled in a strong solution of nitrate of copper. Or, lastly, they may be immersed in a solution of two ounces nitrate of iron and two ounces hyposulphite of soda in one pint of water. Washing, drying, and burnishing complete the process.

To Preserve the Metallic Luster of Sodium.—Sodium is as white as silver, but this is only seen at a fresh cut, as it quickly tarnishes in the air, and even in the naphtha under which it is preserved. In order to make it bright, when tarnished, the coating of caustic soda, by which it is covered, must be removed by strong alcohol, which dissolves it without igniting the sodium; (of course water cannot be used); it is left in the alcohol until quite clean and bright, then it is placed in chemically pure naphtha ether, and finally in a concentrated solution of naphthalin in naphtha ether. In the latter solution the sodium may be kept in an unaltered condition.

To Clean Coral.—The way to clean coral is, first to soak it in soda and water for some hours. Then make a lather of soap, and with a soft hair brush rub the coral lightly, letting the brush enter all the interstices. Pour off the water and replenish it with clean constantly, and then let the coral dry in the sun.

To Paper Whitewashed Walls.—Make a sizing of common glue and water, of the consistency of linseed oil, and apply with the brush to the walls—taking care to go over every part, and especially top and bottom. Apply the paper in the ordinary way as you please.

Value of Chemical Knowledge.—A cold mixture of sulphuric and nitric acids, with a little kerosene or spirits of turpentine, will start a flame in half a minute. Should not every person understand something of the laws of chemistry, as a safeguard against accidents?

Removing Silver from Copper.—Sulphuric acid containing ten per cent. of nitrate of potash, will remove silver. Gold cannot be removed safely with acid.

Good Health.

Poisonous Gum Boots.

Among the many fabrications in which poisonous colors are introduced, we have not until recently noticed *gum boots* enumerated. We have recently learned from the Oroville *Mercury* that there is strong reason to suspect that many serious cases of poisoning have occured among miners, in this State, from the use of green lined gum boots, and that Dr. Logan, of Sacramento, has been corresponding with Dr. Miller, of Oroville, on the subject.

We do not learn that any positive evidence has yet been adduced to prove that these boots are poisonous; but a correspondent of the *Mercury* says that suspected cases of such poisoning "have been treated for poison, and the patients have been speedily and permanently cured. * * * Complaints have never been made about gum boots lined with any other colored textile; and, in consequence of this very simple argument, every one seems to be satisfied that there is something wrong somewhere. There are some who profess that the above mentioned boots do not affect them; but, having conversed with such, I found that they are not all affected alike—some felt a stiffness in the joints—can't get along so well any more as in former times; walking tires them more, etc., and all this from strong, healthy looking men."

The above writer urges that immediate steps be taken to investigate this matter thoroughly by competent experts, and suggests that the Board of Supervisors of Oroville, in which vicinity many suspected cases of such poisoning have occurred should take this matter in hand, and that they should co-operate with the State Board of Health in the investigation. Since the exposure of the danger of using poisonous dyes for coloring fabrices, intended for wearing apparel, it is the duty of dealers to select their goods carefully, and warranted; for it places them in a position to be held responsible for damages.

Health, Wealth, Intellect, Muscle.

That there are people born who inherit certain imperfections, both of the moral and physical nature, peculiar to their forefathers, is universally admitted. And there is no mystery in all this. Were it otherwise, men might sow tares, only, and expect to reap wheat.

Volumes have been written, experiments made, and lectures upon lecture given, upon the subject of "Hereditary Diseases," equalled only in amount of words by sermons upon "Original Sin" and the necessity of repentance. And what is the result of all this? Simply nothing of any practical good. Time rolls on, and the annals of sin and consumption show a frightful increase, and will continue to do so until their opponents attack them at the right time and in the right way.

We must begin with our children. It is through them that all great and lasting reforms are to be brought about. Parents are their natural teachers, and it is much to be regretted that many of them are most unnaturally taught. To educate the intellectual organs at the expense of the physical ones, is the greatest one of the age, and so long as it continues, an intellectual giant and physical dwarf combined, will be no coriosity. This is all wrong. If we would rid ourselves of "hereditary diseases," we must attach more importance to the strong arm and well developed chest. Our sons and daughters may then live to that good old age which the children of men attained in days gone by, the "good old days" as we are wont to call them, when "wasp waists" were considered a deformity, infant schools unknown, and hereditary disease not yet introduced into fashionable life.

Let the motto be, "Health first, then Wealth." A man had better bequeath to his children a sound constitution than all the wealth of a nation. A sick rich man is a beggar compared with a poor well one.

To those inclined to consumption, then, I would say, go to work with but half of the energy and will to save your body from premature decay that you would manifest to save your house from "the devouring element," and success will crown your efforts—health and long life be your reward. Don't stop to "count the cost." The expense to the State, of one execution, is more than need be spent to prevent ten murders. So does one protracted fit of sickness cost more than all the means and appliances necessary to secure twenty sound constitutions.

Consumptive people are those who generally take cold very easy, and why? Because their lungs are weak. A slight cold is a matter of serious importance to them. They feel very well through the day, but night brings no "refreshing sleep," and morning finds them weak and irresolute, with a pain in the back, between the shoulders, in the side or in the chest, and they enter upon the duties of the day wholly unprepared to sustain their share of its toils and burthens. Who has not heard from the lips of such, the common, though none the less significant expression, "It almost kills me when I cough!"

To such I would say, if there be any truth in the old adage, "A stitch in time saves nine," it has a direct bearing, a pointed application in your case. The bridge that almost precipitates the traveler into the river at one time, is pretty sure to do it at another, if it be not repaired.

Curious Advice in Regard to Sleeplessness.—We find in a contemporary, called *Land and Water*, the following recommendations to produce sleep: 1st, to eat raw onions; or 2d, because in a sleepless person the blood is in the brain and not in the stomach, to call the blood down by eating a few hard boiled eggs, followed by a glass of rum or milk, and the paper says you will fall asleep, and bless the name of Frank Buckland who recommended it. We seriously fear that some sleepless man who tries at night the hard boiled eggs and rum in his stomach, may curse the man who gave this remedy.

Harmless Cosmetic Powders.—The *Journal of Pharmacy* announces the fact that the apothecaries of Copenhagen have agreed on the substitution of certain harmless compounds for the numerous poisonous face powders now commonly used. In avoirdupois weight, the proportion of the ingredients will be about as follows: For white powder oxide of zinc, one ounce; wheat starch, nine ounces; oil of rose, three drops. For red powder, carmine, one ounce; carbonate of magnesia, four ounces.

Egg Drink.—The following drink for relieving sickness of stomach was introduced by Dr. Halahan, and is very palatable and agreeable: Beat up one egg very well, say for twenty minutes, then add fresh milk, one pint; water, one pint; sugar, to make it palatable; boil, and let it cool; drink when cold. If it becomes curds and whey it is useless.

Electricity in the Treatment of Vomiting.—Dr. Lente says that severe cases of vomiting can be controlled by electricity after other remedies fail. He uses the faradic current, applying it from the nape of the neck to the epigastrium?

A Fearful Mortality.—For a month past the deaths in New York city have exceeded the births by about 300 weekly. The mortality is greatest among children, who go off rapidly, in defiance of all medical treatment. Bad drainage and the unhealthy mud flats are the attributed causes of the great prevalence of disease.

Domestic Economy.

How to Prepare Tomatoes.

There is an ignorance which is far too wide concerning the preparation of vegetables for the table. They ought to having cooking very simple and very perfect, and they do not always get it. One of the most delicious and healthful of summer foods is the tomato, and it is also one of the most abused. Raw, it is often brought to table cut up into unshapely lumps with the skin still adhering to them. Cooked, it generally appears merely a watery red mess, interspersed with pieces half done, hard and greenish in color. The ideal dish of tomatoes is thus prepared: Choose only those which are large, comparatively smooth, firm, and thoroughly red-ripe—it is an absurdity to offer small or immature specimens in a salad, and if you can't find such as are here recommended, you must not attempt to eat raw tomatoes. Put them in a tin pan and pour over them boiling water, pouring it off immediately. This so loosens the skins that they can usually be pulled off easily, without any violent application of the knife. Then with a very sharp knife slice them across, discarding the first piece, which has the hard base of the stem, and the last piece which is too small. Make the slices thin rather than thick, keep them large and whole, and pile them carefully in layers in a pretty dish, delicately sprinkling salt and pepper over them. Then put them away to get thoroughly cold in your cellar or refrigerator. Prepared thus they are simply ambrosial, and only a pagan could scorn them. If anybody wants to add sugar and vinegar to the seasoning, that can be done at the table by the eater. Slices of the large yellow tomatoes scattered among the red, sometimes make the dish look very tempting.

For stewed tomatoes, peel as above, but cut in pieces, not in slices. Put these in a two-quart tin basin or a porcelain lined saucepan, and add salt and just enough water to keep them from burning. While they are simmering comfortably throw in very little pepper, a good large piece of nice butter, and enough fresh soda cracker broken into small bits to thicken the mixture without making it like a pudding. It should be thin enough to run easily from the spoon, and yet not be watery. This dish also is exquisitely invitiag. There are other methods of cooking tomatoes — stewing with rice, stuffing and baking, etc.—but in no guise are they so good as in those described above.—*Tribune.*

To Make an Oatmeal Custard.—Take two teaspoonfuls of the finest Scotch oatmeal, beat it up into a sufficiency of cold water in a basin to allow it to run freely. Add to it the yolk of a fresh egg, well worked up; have a pint of scalding new milk on the fire, and pour the oatmeal mixture into it, stirring it round with a spoon, so as to incorporate the whole. Add sugar to your taste, and throw in a glass of sherry to the mixture, with a little grated nutmeg. Pour it into a basin, and take it warm in bed. It will be found very grateful and soothing in cases of colds or chills. Some persons scald a cinamon in the milk they use for the occasion.

To Cook Egg-Plant.—Cut the egg-plant in slices half an inch thick, sprinkle a thin layer of salt between the slices, and lay them one over the other, and let them stand an hour. This draws out the bitter principle from the egg-plant, and also a part of the water. Then lay each slice in flour, put in hot fat and fry it brown on both sides. Or boil the egg-plant till tender, remove the skin, mash fine, mix with an equal quantity of bread or cracker crumbs, add salt, pepper, and butter, and bake half an hour. This makes a delightful dish, and a very digestible one, as it has so little oily matter in it.

To Keep Ice Water Cold.—Place between two sheets of thick brown paper a layer of cotton batting half an inch in thickness; fasten the ends of paper and batting together, forming a cylinder like a section of stove pipe. Place this over an ordinary pitcher filled with ice water, making it deep enough to rest on the table. Put over the top a circular cover made in the same way as the cylinder. This will keep boiling water hot as well as ice water cold, since it excludes the air from either.

To Wash Dress Linen.—A teaspoonful of black pepper put into the first water in which gray or buff linen is washed will keep it from spotting. It will also keep the colors of black and colored cambrics and muslins from running. To make silk which has been wrinkled appear like new, sponge on the surface with a weak solution of gum arabic or white glue, and iron on the wrong side.

To Improve Pickles.—A lady correspondent of the Germantown *Telegraph* says that few people know that pieces of horse-radish with a small bag of allspice, added to the vinegar of pickles, improves their flavor and prevents mold.

German Toast.—To one egg beaten well add one cup of sweet milk or cream; season with a little salt and pepper. Cut stale bread in slices, dip in the milk to moisten, and fry in butter on a griddle. This is a nice dish for breakfast.

TABLE OF CONTENTS.

GENERAL EDITORIALS.—Co-Operative Mining; Paul's Dry Process, 113. The Leaf Crumpler, 113. The Fryer Process; Belt Compressor; Optical Phenomena; Opening of the Great Fair, 120. Oakland Gang Plow; Mechanics' Fair, 121-124. General News Items; Patents and Inventions, 124.

ILLUSTRATIONS.—Belt Compressor, No. 2, 114. Apple-leaf Crumpler, 118. Dalton's Patent Gang Plow, 121.

CORRESPONDENCE.—Hydraulic Gold Mining; South Mountain, Idaho, 114.

MECHANICAL PROGRESS.—High and Low Pressure Steam Engines; A New Mechanical Movement; Circular vs. Band Saws; Leather Board; Utilization of Coal Dust; Shaping Soft Rubber with a File; New Barrel Machinery; First Suspension Bridge, 115.

SCIENTIFIC PROGRESS.—The Intensity of Different Colored Lights; Important Invention in Telegraphy; Experiments with Electricity; Changes on the Moon's Surface; Salicylic Acid; New Phenomena of Solar Radiation: Temperature at Great Hights; Vanadium in Rocks; More Planets; New Process for Copper Engraving, 115.

MINING STOCK MARKET.—Sales at the San Francisco Stock Board; Notices of Assessments; Meetings and Dividends; Review of the Stock Market for the Week, 116.

MINING SUMMARY from the various counties in California and Nevada, 117.

POPULAR LECTURES.—Economy of the Vegetable and Animal Kingdoms, 118.

USEFUL INFORMATION.—California Oysters; Singular Explosion; To Protect Maps, Pictures, Etc.; A Simple Way to Make Badly-Fitting Blinds and Doors Shut Tightly; Lead Pencils; To Stain and Varnish Walking Sticks; Green Bronze; To Preserve the Metallic Luster of Sodium; To Clean Coral; To Paper Whitewashed Walls; Value of Chemical Knowledge; Removing Silver from Copper, 119.

GOOD HEALTH.—Poisonous Gum Boots; Health, Wealth, Intellect, Muscle; Curious Advice in Regard to Sleeplessness; Harmless Cosmetic Powders; Egg Drink; Electricity in the Treatment of Vomiting; A Fearful Mortality, 119.

DOMESTIC ECONOMY.—How to Prepare Tomatoes; To Make an Oatmeal Custard; To Cook Egg-Plant; To Keep Ice Water Cold; To Wash Dress Linen; To Improve Pickles; German Toast, 119.

MISCELLANEOUS.—Experiments in Phosphorescence; San Francisco Manufactories, 114. Hair vs. Leather Belts; Compression in Castings; The Universal Use of Arsenic; Grasshoppers not an Unmitigated Evil, 118.

COALS TO NEW CASTLE.—Among the curiosities of the English export business, it may be stated that for some time past one of the Birmingham firms have been manufacturing and exporting trays to Japan. The patterns are designed to suit that market, being chiefly a mosaic of Japanese characters inlaid with gold. The price at which the trays are sold is said to be quite remunerative to the manufacturers. It is thought the trade with Japan in this branch of industry is likely to increase and become permanent. Our American manufacturers should be on the lookout to secure a fair share of the trade which is destined to spring up between this wonderful people and the more advanced nations of the world. It is evident that modern machinery will prove more than a match for the cheapest hand labor that can be found even in the densely populated countries of Eastern Asia.

THE GOLD FIELDS OF JAPAN.—Prof. Henry S. Monroe, of the Imperial college, of Tokio, Japan, has recently made an interesting report upon the gold fields of the Japanese island of Jesso. The results obtained give very little promise of the precious metal being mined to any considerable extent, since the highest average does not exceed 3.77 cents per cubic yard, while in a majority of cases the average is reduced to much below one cent. Such gravel might be worked, if it could be found in deep and extensive deposits, and convenient to plenty of water; but the Japanese deposits are in thin beds of limited extent. Professor Monroe thinks that some of the fields might be profitably worked, notwithstanding their limited depth, the dense vegeteble growth by which they are covered and the inefficiency of the labor at command.

NOTHING now prevents the laying of the track between Los Angeles and Santa Monica but the non-arrival of the ties, which are looked for every day. The 6,000 tons of railway iron brought by the *City of Panama*, will uesily finish the road between the two places.

The Fryer Process.

We received a call this week from one of the gentlemen interested in the much-talked-of Fryer process for working ores, which has been successfully tried on a small scale in Nevada county. Work will shortly be commenced on a larger scale at a place about half way between Nevada City and Grass Valley. The works have a capacity of ten tons per day. The machinery, which is being made at three or four foundries in this city, is nearly done and the boilers and engine are on the ground. It is expected that the new works will start up on the 10th of September, at the latest.

The company owning the patent is composed of twelve or fourteen persons, most of them residents of New York city. Robert M. Fryer is the principal one. Mr. Fryer is not a mining or mill man but is a natural genius and inventor, and a practical workman. The owners of the patent do not regard the process as an experiment at all, being perfectly confident from the tests already made, of its ultimate success. They have asked for no money to help them out, and will first work some mines of their own.

It is contemplated of course, after awhile to sell the right for the process to different parties for a royalty, but at present nothing in this direction has been arranged. In fact, they are not anxious for publicity and intend working their own ores until all their patent arrangements are complete.

Naturally, our informant declines descriptions of the process or hints as to its nature. He simply says the programme is entirely new and they do not utilize any of the machinery now in use, from which we infer no stamps or furnaces are used. Whether the process is based on a method of dissolving out the gold from quartz or not, of course we cannot say. Our informant states they have worked gold ores up to ninety per cent. frequently. In some cases other parties took the ores and results, in trying to find out how the work was done, and found that Fryer had worked the ore up to ninety-six per cent. of assay value. The ore will be worked for about the same price as at present by mill process. The machinery does not cost as much as mills of the same capacity nor are so many men required to help run it. The owners expect as good results from work on a large scale as they obtained in their experimental trial. They are perfectly confident that they can prove their assertions, although they say it makes no difference to them what people think, as theirs is a private enterprise, asking no favors from any one. Of course, of a necessity people will buy the right to use it anyhow. The gentlemen with whom we had the conversation giving us the above information, thinks that by this process hundreds of mines now lying idle, will be worked, as a greater margin of profit will be left by working the ores up to a better percentage. We sincerely hope this will be the case. In the fullness of time we can promise our readers a full description of the new process, that is to say, when the proprietors are ready to make it public.

SHOAL DISCOVERED OFF THE FARALLONES—A notice to mariners issued from the Coast Survey office in Washington states that Lieutenant Commander Taylor, United States Navy, Assistant Coast Survey, searched, June 30 th, for the shoal reported by the Farallone egg company to exist one and one-quarter miles south fifty degrees east, from South Farallone light, on the Pacific coast. In the location indicated no shoal water was found, but on a given hearing, that is south fifty degrees approximately, and distant approximately one-half mile from South Farallone light, a shoal or patch was discovered with six and one-half fathoms of water upon it, sloping down from that to sixteen or eighteen fathoms on the inside. The diameter of the shoal on the ten fathom curve is about fifty yards. Its shape is nearly circular; the bottom rocky; the sea breaking upon the shoal only in exceptionally heavy weather.

DEEP GOLD MINING IN AUSTRALIA.—According to the Melbourne *Argus*, the Prince Patrick company's ground, at Stowell, has been opened with good prospects to a depth of 1,100 feet from the surface. The Magdala company, in the same vicinity, is now working at a depth of 1,600 feet, with a most promising aspect for a much greater depth. The Newington company is down over 1,500 feet. The North Cross Reef, at Stowell, has already yielded $3,000,000. The Prince of Wales company, at Ballarat, is taking very rich rock from their 600 foot level, which is lower than any payable rock has heretofore been found in that district. These and and other recent developments are considered of much importance as giving evidence that rich gold bearing quartz may be found at greater depths than have heretofore been obtained.

THE CENTENNIAL.—Notwithstanding the illustrated criticism upon our Centennial in which many of the English journals have indulged, the manufacturers of England are likely to make a very good representation at our Centennial show. The British Commission is now engaged in the erection of four buildings for the use of English exhibitors.

Belt Compressor.

The exhibition of air compressors and drills by the California Rock Drill Co. in the Fair of the Mechanics' Institute, is one of the most interesting and instructive portions of the exposition. The machinery is of such simple character that it is readily understood by the most casual observer, while the scientist and mechanic will find useful information in the accompanying table, which is compiled as the result of actual tests with the belt compressor. A duplicate of the machine illustrated on our first page has been in operation on the Lincoln mine, Sutter Creek, for the past year, giving entire satisfaction. The belt compressor is a powerful machine, made with separate frames, and may be separated for shipping. It has no reservoir in frame. The diameter of the pulley is 72 inches, face of pulley, 18 in.; diameter of air pump bucket, 14 in.; face of air pump bucket, 12 in.; number of cylinders, 2. With these figures and by consulting the following table an idea may be obtained of some of the excellent characteristics of this compressor.

Number of Cubic Inches of Air Delivered per Revolution at Terminal Pressures per Square Inch of

40 lbs	50 lbs	60 lbs	70 lbs	80 lbs
1008	853	739	652	584

No. of Revo'ns per Minute.	Weight.
80	7,450 lbs

40 lbs	50 lbs	60 lbs	70 lbs	80 lbs
14.6	16.5	18.2	19.6	20.6

The belt compressor is built by the Delamater iron works of New York city, and sold at the depot, No. 328 and 330 Sansome St., S. F.

Optical Phenomena.

If an object habitually seen in motion, as a water wheel, he glanced at when at rest, it appears to be slowly rotating in the opposite direction, and the illusion is only dispelled by a critical comparison with some object known to be at rest. Again, after looking fixedly at a rotating wheel, or a moving belt, if the gaze be suddenly transferred to stationary objects, the latter, or a portion of them seem to be in motion.

The impression of color may be different in the two eyes of the same person. Sitting at a window with the light shining on one side of the face, and looking with each eye alternately at any object, a distinct difference of apparent color is perceived; the eye which is shaded giving the impression of a reddish tint, as compared with the view from the other, and that this is caused by the different light in which the eye itself is placed, irrespective of the object, is proved by simply turning round so as to expose the other side of the face to the light; in a few seconds the effect is reversed.

COMPRESSOR FOR THE OPHIR.—There was yesterday, says the Virginia *Enterprise*, of the 15th inst., received at the depot of the Virginia and Truckee railroad in this city the first carload of the big compressor for the Ophir, which is on its way here from the East. The compressor is of the largest size ever built, and it will take one or two car-loads yet, or possibly more, to bring it all here. The balance is expected right along, and the whole will then be immediately placed in position.

THE artesian well at the Mint in the city has resulted very successfully. It was sunk under the superintendence of Professor Rodgers, who who has charge of the equipment of the refinery. It is 174 feet deep, consisting of an outer casing twelve inches in diameter, second casing ten inches in diameter, third, eight inches in diameter, fourth, seven and one half, which goes to the bottom. It brings up a constant stream, at a head of about five feet above the surface, of 600 gallons per hour.

THE Nevada *Transcript* states that the mine and mill property of the Marietta company, in Washington township, in Nevada county, has been sold to parties in San Francisco. Preparations are being made to commence operations on the mine on a very extensive scale.

WORK on the Nevada county narrow gauge railroad is progressing very favorably. The tunnel between Greenhorn creek and Bear river is completed for the distance of 194 feet, leaving 100 feet yet to be constructed. Grading from Colfax to the west of Buena Vista ranch has been completed.

PERSONAL.—Mr. Robert M. Fryer, one of the inventors of the "Fryer process," was married in Grass Valley, on the 15th inst., to Miss Ida C. Lauder, of San Francisco. This is but another evidence of Mr. Fryar's unbounded faith in the virgin wealth of the Golden State.

AN important mining suit—H. Summers vs. W. S. Bell, *et al.*—for 3,000 feet of the Flagstaff mine, is now before the courts at Santa Rosa. The ground in dispute is a portion of a very rich quicksilver mine in Pine Flat district.

Opening of the Great Fair.

On Tuesday of this week, the tenth Industrial Exhibition of the Mechanics' Institute opened under the most favorable auspices. The directors were, as usual, "on time" with their preparations; but a portion of the exhibits were, as usual, a little behind; but the most delinquent of these will not be allowed to be many days "after the fair."

The opening exercises were of an interesting and appropriate character; commencing with a grand overture by Schmidtt and Schlotts' celebrated band. This was followed by the opening prayer, delived in an impressive manner by Rev. W. H. Beers. After appropriate music, A. S. Hallidie, President of the Institute, delivered an able and intsresting address, which will be found in full on another page.

When President Hallidie had concluded his address, he introduced to the audience Hon. W. J. Shaw, the orator of the day, who delivered an able oration, which was particularly admired for the distinct and pleasant manner in which it wee delivered and ite happily expressed sentiments.

Although the Fair wae not yet in full working order, the attendance for the first dey was larger than could heve been expected. In the evening, of course, there were a great many more visitors than during the afternoon. The crowd continued to ponr into the Pavilion as late as half-past nine.

The Machinery Department this year will, when completed, be better than ever before arranged at our exhibitions. At present it is in an incomplete state, hut vigorous efforts are being made to etraighten it out. Tuesday night the big engine was not ready to run, so no power was furnished. The little Haekin's engine started up by Parke & Lecy, wes too smell for the requirements, it not being intended for such heavy work. Parke & Leoy's fine large air compressor was put in motion to help run down the steem, and a little engine of their's was also run a short time. This constituted all the running mechinery Tuesday night, hut in a few days this department will he one of the chief attractions at the Fair, and when the competitive triels of the drills, pumps, etc., take place, there will be plenty for those interested in such things to see.

The Art Department is under the supervision of the San Francisco Art Association. This department is intended as a feature of instruction and pleasure combined, so that the student can view the best specimens of art available in San Francisco, the public taste can receive instruction, and all enjoy what they see there. The Art Association has very generously tendered its co-operation with the Institute to this end. The artists of this city, at a meeting called by the Art Association, elected Messrs. Scott Tidball, Pietro Mezzara, S. M. Brooks, Edwin Deakin and Benoni Irwin as a committee to directly cooperate with a committee consisting of Messrs. A. S. Hallidie, Henry L. Davis and P. B. Cornwall, appointed by the Board of Managers of the Institute. The first named committee recommended that Mr. Benoni Irwin be appointed superintendent of the Art Department, and Mr. Malmugreu entry clerk and keeper, which recommendations were adopted by the Board of Managers.

Many public spirited citizens have kindly loaned valuable pictures to he exhibited, and all of our local artists will he represented. Oil paintings, statuary and other works of art have been solicited, and the display will he worthy of the occasion. Special watchmen will be appointed to protect all works loaned for the exhibition and the utmost care will he taken in the handling and the safe return of the same to the owners.

The department of the Art Gallery set aside for photographs, will he well filled as usual. The photographers, having taken considerable interest in the matter, are anxious to have as fine a display as possible.

Not the least attractive feature of the exhibition, is the *Fair Daily*, the publishere of which (no egotism) appear to have fairly outdone themselves in their efforts to provide a guide and instructor to the crowds of people who nightly gather in the Pavilion and from whom the eprightly and well arranged columns meet with a heerty welcome.

We shall continue to keep the readers of the SCIENTIFIC PRESS posted in regard to the prominent objects of interest at the Fair from week to week, during its continuance. Opening under such hrilliant anspices it is not too much to anticipate that the Tenth Industrial Exhibition will far surpass its predecessors, and serve as a worthy reflex of San Francisco's wondrous advance in scientific and mechanical progress.

The first train of wood was taken through the Sutro tunnel on Wednesday. Three cars, containing about one cord each, were made into a train and drawn by one mule. The time occupied in transit from the mouth to shaft No. 2 was less than forty-five minutes. It is estimated that one mule with a driver can haul about twenty cords per day, at a cost to the company of about five dollars, or twenty-five cents per cord. This includes all cost but that of hoisting at the shaft.

IT is said that the great iron steamship, *City of Peking*, is a complete failure. Her condition is such that it will cost $250,000 to get her ready for sea again.

A NEW blast is being erected for the forge of the Chico iron works.

Oakland Gang Plow.

We giva on this page an illnstration of a first-class agricultural implement, Dalton's Improved Oakland Gang Plow.

The general appearance of tha implement is shown in Fig. 1; and, we fancy, both the mechanic and the plowman will be favorably impressed with its atyle and character aa there portruyed. One of the apecial points of merit claimed for this plow is tha spring arrangement, as ahown in Fig. 2. The object of this invention is to afford a simple means, whereby the plows may be easily raised and lowered while at work. The essential features of the device, aa aeen in the illnstration, is a coiled spring, which acts npou a crank axle, turning the latter, ao that the plow may work to a depth of nina inches into the ground, or be raised aeven inches above it; and when it is considered that plows, as now constructed, cannot work to a depth of over four inches and a half without requiring chsnging in some manner, and that it is very difficnlt to lift them while in oporation, the advantages of this device will at once be aeen.

Tha ends of the spring are attached to the crank axle and to the frame of the implement, ao that when tha crank, and consequently the frame, is lowered—thus allowing the plows to enter tha ground—the spring is cansed to wind tightly about the axle. The parts are then held by the lever, *A*, which is attached to the crank and aecured as desired by a simple spring-stop in a notched aro, *B*. To raise the plows so that they may operate at any less depth, or be liftad entirely free of the groand, it is only necessary to releuse the spring through the medium of the lever, *A*. The elasticity of the spring then revolves the axle in suoh a direction as to raise tha frame, and with it the plows, more or less, according to the space through which the said axle is allowed to revolve. A long crank axle can be ueed, and thus a wide range of depth of plowing gained.

The invention is constructed of the *best spring steel*, 2½x¾ inches, and the general conatruction of the whole implement is of the most durable description, all parts being of iron, except the pole, foot-rest and plow, tha latter being of superior cast steel; and for light draft, excellent work, dnrability and style, it has no eqnel in the market.

One of the desirable points in this plow is its adaptability to side-hill work. The cranks are so fastened to the axle, hy set screws, that the plane of the wheels can be changed for plowing on side-hills.

Mr. Dalton has produced his plows in the center of a first-class farming community, so that he, as well as his plows, have been subjected to the severest test and criticism. They have stood these tests for seven years, and the manufacturer has the advantage of knowing just what is wanted as well as being able to produce it.

Parties may obtain illustrated circulars and prica lists by addressing H. N Dslton, Pacheco, Contra Costa county, or Frank Bros., 206 Davis etreet, San Francisco, who have the agenoy for this city.

Progress in the Sutro Tunnel.

The following is the report of progress in the Sutro tunnel, for week ending August 15, 1875:

Number of feet in tunnel, August 7	10,413
Nnmber of feet driven during week	82
Distance in, August 15,	10,495

Details of work performed are as follows, heading being 8x10 feet:

Holes drilled	266
Holes blasted	279
Aggregate depth	1,836 feet
Average depth	6.902 feet
Powder consumed	556 lbs
Exploders consumed	279
Rock extracted	1,268 tons

Rock—Clay and porphyry; soft and dungeroue.

Remarks.—Delayed during week laying track, ten hours; timbering bad ground, five hours.

[Signed] A. Sutro, Gen. Supt.

Notice has been given and recorded in the Recorder's office of Fresno county, of a claim for water right by Wm. W. Smith, John T. Jordan and John Barnell. They propose to take water out of the San Joaquin from the west side of "Irrigation district."

The game laws appear to be poorly observed. Salmon are caught and sold daily in the city out of season. The commissioners should prosecute some of the offenders.

It is rumored that tho Southern pacific railroad company propose extending their road from Anaheim to San Diego.

Senator Jones has purchased in New Haven two elegant palace cars and a director's car for his now railroad.

A resident of Sonoma county has invented a steam wagon which is expected to work a revolution in travel on the road.

The Tehama *Tocsin* has made its appearance. Published at Tehama, by Jernegan and Peabody.

It is expected that the Chico water works will be in operation by the close of the week.

Mechanics' Fair.

Address of Presidenl A. S. Hallidie,

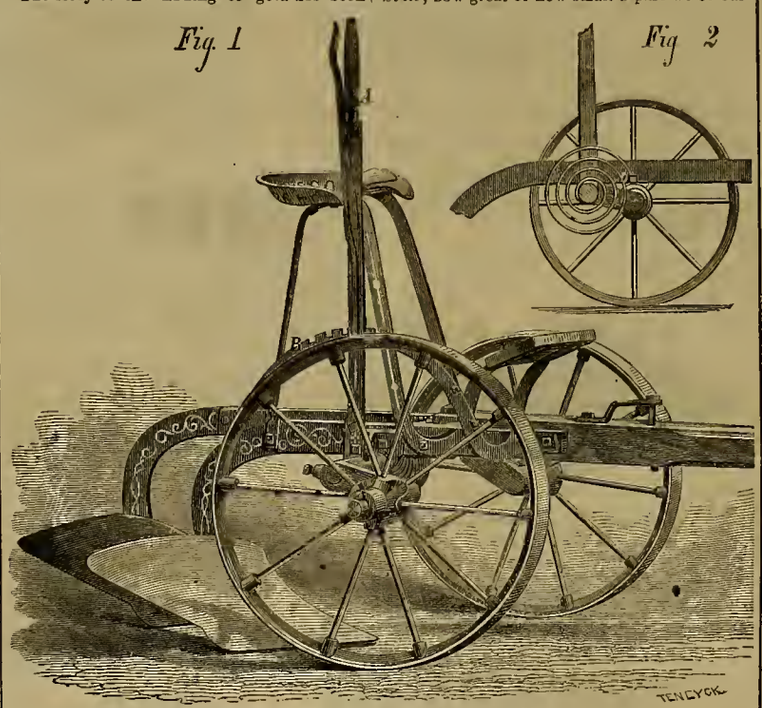
Delivered on the occasion of the Opening of the Tenth Indgstrial Exhibition of the Mechanics' Institute in San Francisco, August 17th, 1875.

Ladies and Gentlemen, Members of the Mechanics' Institute: When California came into the Union, she could little have foreseen her future, much less could ahe have conceived what her influence would be on the civilization of the Pacifio contineots.

During the struggle with Mexico, which terminated by tho cession of California in 1847, to the United Stetes, this territory was not looked npon as uvailable by the people; it was considered hut an outpost of protection against invasion from the Pacifio ocean side, and a natnral western bonndary of our common country. Oregou was better known and understood; it was there the Astors and others cast their eyes, and who either sent out agents or wandered there themselves, in search of wealth and novelty.

That powerful magnet, gold, was yet dormaut, its powers lateut, and California could scarcely have anticipated, from the character of the Argonauts who oame a little later, that they were the precursors of the people of the present day; without that discovery of gold, under the peculiar circumstances of the acquisition of this territory hy the termination of the war with Mexico, California would have been but little kuown and less considered.

The story of the finding of gold hss been



DALTON'S PATENT GANG PLOW.

oft told, in many different ways, and as it is a subject that interests us all, I cannot refrain from telling it as it wss told to me hy William Scott, a millwright, whose acquaintance I made in 1854, and who started for Oregon about 1845, brought up at the south fork of the American river in 1847, and was employed by James Marshall to aid in constructing the saw mill that was being erected for Capt. Sutter at that place, Coloma; those who knew Bill Scott, as he was called, can vouch for his truthfulness, and I have never doubted his ststement.

He said, "Marshall and myself had often had some talk about gold being in the surrounding country; I had no faith in it, but Marshall was enthueiastic, so much so thst many of us made fun of him. One noon I was sitting on my bench, when Marshall, who had been down in the tail race, thut was being cut out by the river, which had been turned in for the purpose of sluicing off the dirt, came up to me, with his old hat in his hand, and a smile all over him, and said, 'Bill, I have found it!' 'Found what?' I said. 'Found some gold', he answered; and from the bottom of his hat he took a piece of stuff that looked to me like brass, and I told him so. I thought it wss a piece of a brass kettle that some of the Indians had been using and had got melted down and run into the gravel. The other boys agreed with me that it was not likely to he gold; but Marshall said he had seen that stuff before and he knew whut it was. It was finally decided that as Mrs. Weimer was making soap, that it should be plsced in the lye over night and if it should not oxidize on exposure to the air they would believe it to be gold."

The rest of the story is well known, and Mr. Marshall is, I believe, in receipt of the priucely sum of $100 per month, granted to him in his old age by the State of California for this discovery.
